Ritson is chiefly offended at the sweeping conclusion in which Percy states the minstrels as subsisting by the arts of poetry and music, and reciting to the harp verses composed by themselves and others. He shows very successfully that this definition is considerably too extensive, and that the term minstrel comprehended, of old, not merely those who recited to the harp or other instrument romances and ballads, but others who were distinguished by their skill in instrumental music only; and, moreover, that jugglers, sleight-of-hand performers, dancers, tumblers, and such like subordinate artists, who were introduced to help away the tedious hours in an ancient feudal castle, were also comprehended under the general term of minstrel. But although he distinctly proves that Percy's definition applied only to one class of the persons termed minstrels, those, namely, who sung or recited verses, and in many cases of their own composition; the bishop's position remains unassailable, in so far as relates to one general class, and these the most dis-

The Minstrels.

¹ *Essay on Ancient Minstrels in England* prefixed to the first volume of Bishop Percy's *Reliques*.

Romance. tingished during the middle ages. All minstrels did not use the harp, and recite or compose romantic poetry; but it cannot be denied that such was the occupation of the most eminent of the order. This Ritson has rather admitted than denied; and the number of quotations which his industry has brought together, rendered such an admission inevitable.

Indeed, the slightest acquaintance with ancient romances of the metrical class, shows us that they were composed for the express purpose of being recited, or, more properly, chaunted to some simple tune or cadence for the amusement of a large audience. Our ancestors, as they were circumscribed in knowledge, were also more limited in conversational powers than their enlightened descendants; and it seems probable, that in their public festivals, there was great advantage found in the presence of a minstrel who should recite some popular composition on their favourite subjects of love and war, to prevent those pauses of discourse which sometimes fall heavily on a company, even of the present accomplished age, and to supply an agreeable train of ideas to those guests who had few of their own. It is, therefore, almost constantly insinuated, that the romance was to be chaunted or recited to a large and festive society; and in some part or other of the piece, generally at the opening, there is a request of attention on the part of the performer; and hence, the perpetual "Lythe and listen lordings free," which in those, or equivalent words, forms the introduction to so many romances. As, for example, in the old poem of *Guy and Colbrand*, the minstrel speaks of his own occupation:

When meat and drink is great plentye,
Then lords and ladyes still will be,
And sit and solace lythe;
Then it is time for mee to speake,
Of kern knights and kempes greate,
Such carping for to kythe.

Chaucer, also, in his rhyme of Sir Thopas, assigns to the minstrels of his hero's household the same duty of reciting romances of spiritual or secular heroes, for the good knight's pastime while arming himself for battle:

"Do cum," he sayd, "my minestrale,
And jestours for to tellen tales
Anon in min arming,
Of romaunces that ben reales,
Of popes and of cardinales,
And eke of love-longing."

Not to multiply quotations, we will only add one of some importance, which must have escaped Ritson's researches; for his editorial integrity was such, as rendered him incapable of suppressing evidence on either side of the question. In the old romance or legend of *True Thomas and the Queen of Elfland*, Thomas the Rhymer, himself a minstrel, is gifted by the Queen of the Faery with the faculties of music and song. The answer of Thomas is not only conclusive as to the minstrel's custom of recitation, but shows that it was esteemed the highest branch of his profession, and superior as such to mere instrumental music:

"To harp and cap Thomas wheresoever ye gon,
Thomas take the these with the" —
"Harping," he said, "ken I non,
For tong is chefe of Mynstralse."¹

We, therefore, arrive at the legitimate conclusion, that although, under the general term minstrels, were compre-

Romance. hended many who probably entertained the public only with instrumental performances, with ribald tales, with jugglery, or farcical representations, yet one class amongst them, and that a numerous one, made poetical recitation their chief, if not their exclusive occupation. The memory of these men was, in the general case, the depository of the pieces which they recited; and hence, although a number of their romances still survive, very many more have doubtless fallen into oblivion.

That the minstrels were also the authors of many of these poems, and that they altered and enlarged others, is a matter which can scarcely be doubted, when it is proved that they were the ordinary reciters of them. It was as natural for a minstrel to become a poet or composer of romances, as for a player to be a dramatic author, or a musician a composer of music. Whatever individual among a class, whose trade it was to recite poetry, felt the least degree of poetical enthusiasm in a profession so peculiarly calculated to inspire it, must, from that very impulse, have become an original author, or translator at least; thus giving novelty to his recitations, and acquiring additional profit and fame. Bishop Percy, therefore, states the case fairly in the following passage: "It can hardly be expected that we should be able to produce regular and unbroken annals of the minstrel art and its professors, or have sufficient information, whether every minstrel or bard composed himself, or only repeated, the songs he chaunted. Some probably did the one and some the other; and it would have been wonderful indeed, if men, whose peculiar profession it was, and who devoted their time and talents to entertain their hearers with poetical compositions, were peculiarly deprived of all poetical genius themselves, and had been under a physical incapacity of composing those common popular rhymes, which were the usual subjects of their recitation."² While, however, we acquiesce in the proposition, that the minstrels composed many, perhaps the greater part of the metrical romances which they sung, it is evident they were frequently assisted in the task by others who, though not belonging to this profession, were prompted by leisure and inclination to enter upon the literary or poetical department as amateurs. These very often belonged to the clerical profession, amongst whom relaxation of discipline, abundance of spare time, and impatience of the routine of ceremonious duties, often led individuals into worse occupations than the listening to or composing metrical romances. It was in vain that both the poems and the minstrels who recited them were, by statute, debarred from entering the more rigid monasteries. Both found their way frequently to the refectory, and were made more welcome than brethren of their own profession; as we may learn from a memorable *Gest*, in which two poor travelling priests, who had been received into a monastery with acclamation, under the mistaken idea of their being minstrels, are turned out in disgrace, when it is discovered that they were indeed capable of furnishing spiritual instruction, but understood none of the entertaining arts with which the hospitality of their convent might have been repaid by itinerant bards.

Nay, besides a truant disposition to a forbidden task, many of the grave authors may have alleged, in their own defence, that the connexion between history and romance was not in their day entirely dissolved. Some eminent men exercised themselves in both kinds of composition; as, for example, Maitre Wace, canon of Caen, in Normandy, who, besides the metrical chronicle of *Le Brut*, containing

¹ Jamieson's *Popular Ballads*, vol. ii. p. 27.

² *Essay on the Ancient Minstrels*, p. 30.

Another authority of ancient date, the *Chronicle* of Bertrand Guesclin, distinctly attributes the most renowned romances to the composition of the minstrels by whom they were sung. As the passage will be afterwards more fully quoted, we must here only say, that after enumerating Arthur, Launcelot, Godfrey, Roland, and other champions, he sums up his account of them as being the heroes

De quoi cilz minstriers font les nobles romans.

Romance. the earliest history of England, and other historical legends, wrote, in 1155, the *Roman de Chevalier de Lyon*, probably the same translated under the title of *Yvain and Gawain*. Lambert li Cors, and Benoit de Saint-Maur, seem both to have been of the clerical order; and, perhaps, Chretien de Troyes, a most voluminous author of romance, was of the same profession. Indeed, the extreme length of many romances being much greater than any minstrel could undertake to sing at one or even many sittings, may induce us to refer them to men of a more sedentary occupation than those wandering poets. The religious romances were, in all probability, the works of such churchmen as might wish to reconcile an agreeable occupation with their religious profession. All which circumstances must be received as exceptions from the general proposition, that the romances in metre were the composition of the minstrels by whom they were recited or sung, though they must still leave Percy's proposition to a certain extent unimpeached.

To explain the history of Romance, it is necessary to digress a little further concerning the condition of the minstrels by whom these compositions were often made, and, generally speaking, preserved and recited. And here, it must be confessed, that the venerable Prelate has, perhaps, suffered his love of antiquity, and his desire to ennoble the productions of the middle ages, a little to overcolour the importance and respectability of the minstrel tribe; although his opponent Ritson has, on the other hand, seized on all circumstances and inferences which could be adduced to prove the degradation of the minstrel character, without attending to the particulars by which these depreciating circumstances were qualified. In fact, neither of these excellent antiquaries has cast a general or philosophical glance on the necessary condition of a set of men who were by profession the instruments of the pleasure of others during a period of society such as was presented in the middle ages.

In a very early period of civilisation, ere the division of tribes had been generally adopted, and while each tribe may be yet considered as one great family, and the nation as an union of such independent tribes, the poetical art, so nearly allied to that of oratory or persuasion, is found to ascertain to its professors a very high rank. Poets are then the historians and often the priests of the tribe. Their command of language, then in its infancy, excites not merely pleasure, but enthusiasm and admiration. When separated into a distinct class, as was the case with the Celtic bards, and, perhaps, with the skalds of Scandinavia, they rank high in the scale of society, and we not only find kings and nobles listening to them with admiration, but emulous of their art, and desirous to be enrolled among their numbers. Several of the most renowned northern kings and champions valued themselves as much upon their powers of poetry as on their martial exploits; and of the Welsh princes, the Irish kings, and the Highland chiefs of Scotland, very many practised the arts of poetry and music. Llŵarch Hen was a prince of the Cymraig, Brian Boromhe, a harper and a musician, and without resorting to the questionable authenticity of Ossian, several instances of the same kind might be produced in the Highlands.

But, in process of time, when the classes of society come to assume their usual gradation with respect to each other, the rank of professional poets is uniformly found to sink gradually in the scale, along with that of all others whose trade it is to contribute mere amusement. The professional poet, like the player or the musician, becomes the companion and soother only of idle and convivial hours; his presence would be unbecoming on occasions of gravity and importance; and his art is accounted at best an amusing but useless luxury. Although the intellectual pleasure derived from poetry or from the exhibition of the drama be of a different and much higher class than that

Romance. derived from the accordance of sounds, or from the exhibition of feats of dexterity, still it will be found that the opinions and often the laws of society, while individuals of these classes are cherished and held in the highest estimation, have degraded the professions themselves among its idle, dissolute, and useless appendages. Although it may be accounted ungrateful in mankind thus to reward the instruments of their highest enjoyments, yet some justification is usually to be drawn from the manners of the classes who were thus lowered in public opinion. It must be remembered, that, as professors of this joyous science, as it was called, the minstrels stood in direct opposition to the more severe part of the Catholics, and to the monks in particular, whose vows bound them to practise virtues of the ascetic order, and to look upon every thing as profane which was connected with mere worldly pleasure. The manners of the minstrels themselves gave but too much room for clerical censure. They were the usual assistants at scenes, not merely of conviviality, but of license; and as the companions and encouragers of revelling and excess, they became contemptible in the eyes, not only of the aged and the serious, but of the libertine himself, when his debauch palled on his recollection. The minstrels, no doubt, like their brethren of the stage, sought an apology in the corrupted taste and manners of their audience, with which they were obliged to comply, under the true but melancholy condition that

—they who live to please must please to live.

But this very necessity, rendered more degrading by their increasing numbers and decreasing reputation, only accelerated the total downfall of their order, and the general discredit and neglect into which they had fallen. The statute of the 39th of Queen Elizabeth, passed at the close of the sixteenth century, ranks those dishonoured sons of song among rogues and vagabonds, and appoints them to be punished as such; and the occupation, though a vestige of it was long retained in the habits of travelling ballad-singers and musicians, sunk into total neglect and contempt. Of this we shall have to speak hereafter; our business being at present with those romances, which, while still in the zenith of their reputation, were the means by which the minstrels, at least the better and higher class amongst them, recommended themselves to the favour of their noble patrons, and of the audiences whom they addressed.

It may be presumed, that, although the class of minstrels, like all who merely depend upon gratifying the public, carried in their very occupation the evils which first infected, and finally altogether depraved their reputation; yet, in the earlier ages, their duties were more honourably estimated, and some attempts were made to introduce into their motley body the character of a regular establishment, subjected to discipline and subordination. Several individuals, both of France and England, bore the title of king of minstrels, and were invested probably with some authority over the others. The serjeant of minstrels is also mentioned; and Edward IV. seems to have attempted to form a guild or exclusive corporation of minstrels. John of Gaunt, at an earlier period, established (between jest and earnest, perhaps) a court baron of minstrels, to be held at Tilbury. There is no reason, however, to suppose that the influence of their establishments went far in restraining the licence of a body of artists so unruly as well as numerous.

It is not, indeed, surprising that individuals, whose talents in the arts of music or of the stage rise to the highest order, should, in a special degree, attain the regard and affection of the powerful, acquire wealth, and rise to consideration; for, in such professions, very high prizes are assigned only to pre-eminent excellence; while ordinary or inferior practisers of the same art may be said to draw in the lottery something worse than a mere blank. Garrick, in

Romance. nis chariot, and whose company was courted for his wit and talent, was, after all, by profession, the same with the unfortunate stroller, whom the British laws condemn as a vagabond, and to whose dead body other countries refuse even the last rites of Christianity. In the same manner it is easy to suppose that, when in compliance with the taste of their age, monarchs entertained their domestic minstrels,¹ those persons might be admitted to the most flattering intimacy with their royal masters; sleep within the royal chamber,² amass considerable fortunes, found hospitals,³ and receive rewards singularly over-proportioned to the perquisites of the graver professions;⁴ and even practise in company with their royal masters the pleasing arts of poetry and music, which all are so desirous of attaining;⁵ whilst, at the same time, those who ranked lower in the same profession were struggling with difficulty to gain a precarious subsistence, and incurring all the disgrace usually attached to a vagabond life and a dubious character. In the fine arts, particularly, excellence is demanded, and mere mediocrity is held contemptible; and, while the favour with which the former is loaded, sometimes seems disproportioned to the utility of the art itself, nothing can exceed the scorn poured out on those who expose themselves by undertaking arts which they are unable to practise with success. Self-conceit, however, love of an idle life, and a variety of combined motives, never fail to recruit the lower orders of such idle professions with individuals by whose performances, and often by their private characters, the art which they have rashly adopted can only be discredited without any corresponding advantage to themselves. It is not, therefore, surprising that, while such distinguished examples of the contrary appeared amongst individuals, the whole body of minstrels, with the romances which they composed and sung, should be reprobated by graver historians in such severe terms as often occur in the monkish chronicles of the day.

Character and style of the romances of chivalry. Respecting the style of their composition, Du Cange informs us, that the minstrels sometimes devoted their strains to flatter the great, and sing the praises of those princes by whom they were protected; while he owns, at the same time, that they often recommended to their hearers the path of virtue and nobleness, and pointed out the pursuits by which the heroes of romance had rendered themselves renowned in song.⁶ He quotes from the romance of *Bertrand Guesclin*, the injunction on those who would rise to

fame in arms to copy the valiant acts of the Paladins of Romance. Charles, and the Knights of the Round Table, narrated in romances; and it cannot be denied, that those high tales, in which the virtues of generosity, bravery, devotion to his mistress, and zeal for the Catholic religion, were carried to the greatest height of romantic perfection in the character of the hero, united with the scenes passing around them, were of the highest importance in affecting the character of the age. The fabulous knights of romance were so completely identified with those of real history, that graver historians quote the actions of the former in illustration of, and as a corollary to the real events which they narrate.⁷ The virtues recommended in romance were, however, only of that overstrained and extravagant cast which consisted with the spirit of chivalry. Great bodily strength, and perfection in all martial exercises, was the universal accomplishment inalienable from the character of the hero, and which each romancer had it in his power to confer. It was also easily in the composer's power to devise dangers, and to free his hero from them by the exertion of valour equally extravagant. But it was more difficult to frame a story which should illustrate the manners as well as the feats of chivalry; or to devise the means of evincing that devotion to duty, and that disinterested desire to sacrifice all to faith and honour;—that noble spirit of achievement which laboured for others more than itself—which form, perhaps, the fairest side of the system under which the noble youths of the middle ages were trained up. The sentiments of chivalry, as we have explained in our article on that subject, were founded on the most pure and honourable principles, but unfortunately carried into hyperbole and extravagance; until the religion of its professors approached to fanaticism, their valour to frenzy, their ideas of honour to absurdity, their spirit of enterprise to extravagance, and their respect for the female sex to a sort of idolatry. All those extravagant feelings, which really existed in the society of the middle ages, were magnified and exaggerated by the writers and reciters of romance; and these given as resemblances of actual manners, became, in their turn, the glass by which the youth of the age dressed themselves; while the spirit of chivalry and of romance thus gradually threw light upon and enhanced each other.

The romances, therefore, exhibited the same system of manners which existed in the nobles of the age. The character of a true son of chivalry was raised to such a pitch

¹ Berdic (*Regis Joculator*), the jongleur or minstrel of William the Conqueror, had, as appears from the Domesday record, three villas and five caracates of land in Gloucestershire without rent. Henry I. had a minstrel called Galfrid, who received an annuity from the abbey of Hyde.

² A minstrel of Edward I., during that prince's expedition to the Holy Land, slept within his tent, and came to his assistance when an attempt was made to assassinate him.

³ The Priory and Hospital of Saint Bartholomew, in London, was founded in the reign of Henry I. by Royer or Raher, a minstrel of that prince.

⁴ In 1441, the monks of Maxlock, near Coventry, paid a donation of four shillings to the minstrels of Lord Clinton for songs, harping, and other exhibitions, while, to a doctor who preached before the community in the same year, they assigned only sixpence.

⁵ The noted anecdote of Blondel and his royal master, Richard Cœur de Lion, will occur to every reader.

⁶ MINISTELLI dicti præsertim scurræ, mimi, joculatores, quos etiamnum vulgo *Menestreaux* vel *Menestriers*, appellamus. Porro ejusmodi scurrarum erat Principes, non suis duntaxat ludicris oblectare, sed et eorum aures variis avorum, adeoque ipsorum Principum laudibus, non sine assentatione, cum cantilenis et musicis instrumentis, demulcere. Interdum etiam virorum insignium et heroum gesta, aut explicata et jucunda narratione commemorabant, aut suavi vocis inflectione, fidibusque decantabant, quo sic dominorum, cæterorumque qui his intererant ludicris, nobilium animos ad virtutem capessendam et summorum virorum imitationem accenderent: quod fuit olim apud Gallos Bardorum ministerium, ut auctor est Tacitus. Neque enim alios à *Ministellis*, veterum Gallorum *Bardos* fuisse pluribus probat Henricus Valesius ad 15. Ammiani.—*Chronicon* Bertrandi Guesclini:

Qui veut avoir renom des bons et des vaillans,
Il doit aler souvent à la pluie et au champ,
Et estre en la bataille, ainsi que fu Rollans,
Les quatre fils Haimon et Charlon li plus grans,
Li Dus Lions de Bourges, et Guion de Connans,
Perceval li Galois, Lancelot et Tristans,
Alexandres, Artus, Godefroy li sachans,
De quoy cils menestriers font les nobles Romans.

⁷ Barbour, the Scottish historian, censures a Highland chief, when, in commending the prowess of Bruce in battle, he likened him to the Celtic hero, Fin Mac Coul, and says, he might in more manly fashion have compared him to Gaudifer, a champion celebrated in the romance of Alexander.

Romance. of ideal and impossible perfection, that those who emulated such renown were usually contented to stop far short of the mark. The most adventurous and unshaken valour, a mind capable of the highest flights of romantic generosity, a heart which was devoted to the will of some fair idol, on whom his deeds were to reflect glory, and whose love was to reward all his toils; these were attributes which all aspired to exhibit who sought to rank high in the annals of chivalry; and such were the virtues which the minstrels celebrated. But, like the temper of a tamed lion, the fierce and dissolute spirit of the age often shewed itself through the fair varnish of this artificial system of manners. The valour of the hero was often stained by acts of cruelty, or freaks of rash desperation; his courtesy and munificence became solemn foppery and wild profusion; his love to his lady often demanded and received a requital inconsistent with the honour of the object; and those who affected to found their attachment on the purest and most delicate metaphysical principles, carried on their actual intercourse with a license altogether inconsistent with their sublime pretensions. Such were the real manners of the middle ages, and we find them so depicted in these ancient legends.

So high was the national excitation in consequence of the romantic atmosphere in which they seemed to breathe, that the knights and squires of the fourteenth and fifteenth centuries imitated the wildest and most extravagant emprises of the heroes of romance; and, like them, took on themselves the most extraordinary adventures to shew their own gallantry, and do most honour to the ladies of their hearts. The females of rank, erected into a species of goddesses in public, and often degraded as much below their proper dignity in more private intercourse, equalled in their extravagances the youth of the other sex. A singular picture is given by Knyghton of the damsels-errant who attended upon the solemn festivals of chivalry, in quest, it may reasonably be supposed, of such adventures as are very likely to be met with by such females as think proper to seek them. "These tournaments are attended by many ladies of the first rank and greatest beauty, but not always of the most untainted reputation. These ladies are dressed in party-coloured tunics, one-half of one colour and the other half of another; their lirripipes, or tippets, are very short; their caps remarkably little, and wrapt about their heads with cords; their girdles and pouches are ornamented with gold and silver; and they wear short swords, called *daggers*, before them, a little below their navels; they are mounted on the finest horses, with the richest furniture. Thus equipped, they ride from place to place in quest of tournaments, by which they dissipate their fortunes, and sometimes ruin their reputation."—(Knyghton, quoted in Henry's *History*, vol. viii. p. 402.)

The minstrels, or those who aided them in the composition of the romances, which it was their profession to recite, roused to rivalry by the unceasing demand for their compositions, endeavoured emulously to render them more attractive by subjects of new and varied interest, or by marvellous incidents which their predecessors were strangers to. Much labour has been bestowed, somewhat unprofitably, in endeavouring to ascertain the sources from which they drew the embellishments of their tales, when the hearers began to be tired of the unvaried recital of battle and tournament which had satisfied the simplicity of a former age. Percy has contended for the northern *Sagas* as the unquestionable origin of the romance of the middle ages. Warton conceived that the *Oriental fables*, borrowed by those minstrels who visited Spain, or who in great numbers attended the crusades, gave the principal distinctive colouring to those remarkable compositions; and a later system, patronised by later authors, has derived them, in a great measure, from

Romance. the fragments of classical superstition, which continued to be preserved after the fall of the Roman empire. All those systems seem to be inaccurate, in so far as they have been adopted, exclusively of each other, and of the general proposition, that fables of a nature similar to the romances of chivalry, modified according to manners and state of society, must necessarily be invented in every part of the world, for the same reason that grass grows upon the surface of the soil in every climate and in every country. "In reality," says Mr. Southey, who has treated this subject with his usual ability, "mythological and romantic tales are current among all savages of whom we have any full account; for man has his intellectual as well as his bodily appetites, and these things are the food of his imagination and faith. They are found wherever there is language and discourse of reason; in other words, wherever there is man. And in similar stages of civilization, or states of society, the fictions of different people will bear a corresponding resemblance, notwithstanding the difference of time and scene."¹

To this it may be added, that the usual appearances and productions of nature offer to the fancy, in every part of the world, the same means of diversifying fictitious narrative by the introduction of prodigies. If in any romance we encounter the description of an elephant, we may reasonably conclude that a phenomenon, unknown in Europe, must have been borrowed from the east; but whosoever has seen a serpent and a bird, may easily aggravate the terrors of the former by conferring on a fictitious monster the wings of the latter; and whoever has seen or heard of a wolf, or lion, and an eagle, may, by a similar exertion of invention, imagine a griffin or hippogriff. It is imputing great poverty to the human imagination, to suppose that the *speciosa miracula*, which are found to exist in different parts of the world, must necessarily be derived from some common source; and perhaps we should not err more grossly in supposing that the various kinds of boats, skiffs, and rafts, upon which men have dared the ocean on so many various shores, have been all originally derived from the vessel of the Argonauts.

On the other hand, there are various romantic incidents and inventions of a nature so peculiar, that we may boldly, and at once, refer them to some particular and special origin. The tale of *Flora and Blanchefleur*, for example, could only be invented in the east, where the scene is laid, and the manners of which are observed with some accuracy. That of *Orfeo and Heurodis*, on the contrary, is the classical history of Orpheus and Eurydice, with the Gothic machinery of the elves or fairies, substituted for the infernal regions. But notwithstanding these and many other instances in which the subjects or leading incidents of romance can be distinctly traced to British or Aimerican traditions, to the tales and history of classic antiquity, to the wild fables and rich imagery of Arabia, or to those darker and sterner themes which were first treated of by the Skalds of the north, it would be assuming greatly too much upon such grounds to ascribe the derivation of romantic fiction, exclusively to any one of these sources. In fact, the foundation of these fables lies deep in human nature, and the superstructures have been imitated from various authorities by those who, living by the pleasure which their lays of chivalry afforded to their audience, were especially anxious to recommend them by novelty of every kind; and were undoubtedly highly gratified when the report of travellers, or pilgrims, or perhaps their own intercourse with minstrels of other nations, enabled them to vary their usual narrations with circumstances yet unheard in bower and hall. Romance, therefore, was like a compound metal, derived from various mines, and in the different specimens of which, one metal or other was alternately predominant; and viewed in this light, the ingenious theories of those learned antiquaries, who have

¹ Preface to Southey's edition of the *Morte D'Arthur*. Lond. 1817, 2 vols. 4to.

Romance. endeavoured to seek the origin of this style of fiction in one of these sources alone, to the exclusion of all others, seem as vain as that of travellers affecting to trace the proper head of the Nile to various different springs, all of which are owned to be accessory to form the full majesty of his current.

Prose romance.

As the fashion of all things passes away, the metrical romances began gradually to decline in public estimation, probably on account of the depreciated character of the minstrels by whom they were recited. Tradition, says Ritson, is an alchemy, which converts gold into lead; and there is little doubt, that, in passing from mouth to mouth, and from age to age, the most approved metrical romances became gradually corrupted by the defect of memory of some reciters and the interpolations of others; since few comparatively can be supposed to have had recourse to the manuscripts in which some have been preserved. Neither were the reciters in the latter, as in the former times, supplied with new productions of interest and merit. The composition of the metrical romance was gradually abandoned to persons of an inferior class. The art of stringing together in loose verse a number of unconnected adventures, was too easy not to be practised by many who only succeeded to such a degree as was discreditable to the art, by shewing that mere mediocrity was sufficient to exercise it. And the licentious character, as well as the great number of those who, under the various names of glee-men, minstrels, and the like, traversed the country, and subsisted by this idle trade, brought themselves and their occupation into still greater contempt and disregard. With them, the long recitations formerly made at the tables of the great, were gradually banished into more vulgar society.

But though the form of those narratives underwent a change of fashion, the appetite for the fictions themselves continued as ardent as ever; and the prose romances which succeeded, and finally superseded those composed in verse, had a large and permanent share of popularity. This was, no doubt, in a great degree owing to the important invention of printing, which has so much contributed to alter the destinies of the world. The metrical romances, though in some instances sent to the press, were not very fit to be published in this form. The dull amplifications which passed well enough in the course of a half-heard recitation, became intolerable when subjected to the eye; and the public taste gradually growing more fastidious as the language became more copious, and the system of manners more complicated, graces of style and variety of sentiment were demanded instead of a naked and unadorned tale of wonders. The authors of the prose romance endeavoured, to the best of their skill, to satisfy this newly awakened and more refined taste. They used, indeed, the same sources of romantic history which had been resorted to by their metrical predecessors; and Arthur, Charlemagne, and all their chivalry, were as much celebrated in prose as ever they had been in poetic narrative. But the new candidates for public favour pretended to have recourse to sources of authentic information, to which their metrical predecessors had no access. They refer almost always to Latin, and sometimes to Greek originals, which certainly had no existence; and there is little doubt that the venerable names of the alleged authors are invented, as well as the supposed originals from which they are said to have translated their narratives. The following account of the discovery of *La tres elegante deliecieux mellistue et tres plaisante Hystoire du tres noble Roy Perceforest* (printed at Paris in 1528 by Galliot du Pré,) may serve to show that modern authors were not the first who invented the popular mode of introducing their works to the world as the contents of a newly discovered manuscript. In the abridgment to which we are limited, we can give but a faint picture of the minuteness with which the author announces his pretended discovery, and which forms an admirable example of the lie with a circumstance.

In the year 1286, Count William of Hainault had, it is averred, crossed the seas in order to be present at the nuptials of Edward, and in the course of a tour through Britain, was hospitably entertained at an abbey situated on the banks of the Humber, and termed, it seems, Burtimer, because founded by a certain Burtimericus, a monarch of whom our annals are silent, but who had gained, in that place, a victory over the heathens of Germany. Here a cabinet, which was inclosed in a private recess, had been lately discovered within the massive walls of an ancient tower, and was found to contain a Grecian manuscript, along with a royal crown. The abbot had sent the latter to king Edward, and the Count of Hainault with difficulty obtained possession of the manuscript. He had it rendered from Greek into Latin by a monk of the abbey of Saint Landelain, and from that language it is said to have been translated into French by the author, who gives it to the world in honour of the blessed Virgin, and for the edification of nobleness and chivalry.

By such details, the authors of the prose romances endeavoured to obtain for their works a credit for authenticity which had been denied to the rhythmical legends. But in this particular they did great injustice to their contemned predecessors, whose reputations they murdered in order to rob them with impunity. Whatever fragments or shadowings of true history may yet remain hidden under the mass of accumulated fable, which had been heaped on them during successive ages, must undoubtedly be sought in the metrical romances; and according to the view of the subject which we have already given, the more the works approach in point of antiquity to the period where the story is laid, the more are we likely to find those historical traditions in something approaching to an authentic state. But those who wrote under the imaginary names of Rusticien de Puisse, Robert de Borron, and the like, usually seized upon the subject of some old minstrel; and, composing the whole narrative after their own fashion, with additional characters and adventures, totally obliterated in that operation any shades which remained of the first, and probably authentic tradition, which was the original source of the elaborate fiction. Amplification was especially employed by the prose romancers, who, having once got hold of a subject, seem never to have parted with it until their power of invention was completely exhausted. The metrical romances, in some instances, indeed, ran to great length, but were much exceeded in that particular by the folios which were written on the same or similar topics by their prose successors. Probably the latter judiciously reflected that a book which addresses itself only to the eyes, may be laid aside when it becomes tiresome to the reader; whereas it may not always have been so easy to stop the minstrel in the full career of his metrical declamation.

Who, then, the reader may be disposed to inquire, can have been the real authors of those prolix works, who, shrouding themselves under borrowed names, derived no renown from their labours, if successful, and who, certainly, in the infant state of the press, were not rewarded with any emolument? This question cannot, perhaps, be very satisfactorily answered; but we may reasonably suspect that the long hours of leisure which the cloister permitted to its votaries, were often passed away in this manner; and the conjecture is rendered more probable, when it is observed that matters are introduced into those works which have an especial connection with sacred history, and with the traditions of the Church. Thus, in the curious romance of *Huon de Bourdeaux*, a sort of second part is added to that delightful history, in which the hero visits the terrestrial paradise, encounters the first murderer Cain, in the performance of his penance, with more matter to the same purpose, not likely to occur to the imagination of a layman; besides, the laity of the period were in general too busy and too igno-

Romance. rant to engage in literary tasks of any kind. The mystical portion of the romance of the *Round Table* seems derived from the same source. It may also be mentioned, that the audacious, and sometimes blasphemous assertions, which claimed for these fictions the credit due even to the inspired writings themselves, were likely to originate amongst Roman Catholic churchmen, who were but too familiar with such forgeries for the purpose of authenticating the legends of their superstition. One almost incredible instance of this impious specious imposture occurs in the history of the *Saint Graal*, which curious mixture of mysticism and chivalry is ascribed by the unfearing and unblushing writer to the second person of the Trinity.

Churchmen, however, were by no means the only authors of these legends, although the *Sires Clercs*, as they were sometimes termed, who were accounted the chronicles of the times in which they lived, were usually in orders; and although it appears that it was upon them that the commands of the sovereigns whom they served often imposed the task of producing new romances under the usual disguise of ancient chronicles translated from the learned languages, or otherwise collected from the ruins of antiquity. As education became improved, and knowledge began to be more generally diffused, individuals among the laity, and those of no mean rank, began to feel the necessity, as it may be called, of putting into a permanent form the "thick-coming fancies" which gleam along the imagination of men of genius. Sir Thomas Malory, who compiled the *Morte D'Arthur* from French originals, was a person of honour and worship; and Lord Berners, the excellent translator of Froissart, and author of a romance called *The Chevalier de la Cygne*, is an illustrious example that a nobleman of high estimation did not think his time misemployed on this species of composition. Some literary fame must therefore have attended these efforts; and perhaps less eminent authors might, in the latter ages, receive some pecuniary advantages. The translator of *Perceforest*, formerly mentioned, who appears to have been an Englishman or Fleming, in his address to the warlike and invincible nobility of France, holds the language of a professional author, who expected some advantage besides that of pleasing those whom he addressed; and who expresses proportional gratitude for the favourable reception of his former feeble attempts to please them. It is possible, therefore, that the publishers, these lions of literature, had begun already to admit the authors into some share of their earnings. Other printers, like the venerable Caxton, compiled themselves, or translated from other languages, the romances which they sent to the press; thus uniting in their own persons the three separate departments of author, printer, and publisher.

The prose romance did not, in the general conduct of the story, where digressions are heaped on digressions, without the least respect to the principal narrative, greatly differ from that of their metrical predecessors, being to the full as tedious and inartificial; nay, more so, in proportion as the new romances were longer than the old. In the transference from verse to prose, and the amplification which the scenes underwent in the process, many strong, forcible, and energetic touches of their original author have been weakened, or altogether lost; and the reader misses with regret some of the redeeming bursts of rude poetry which, in the metrical romance, make amends for many hundred lines of bald and rude versification. But, on the other hand, the prose romances were written for a more advanced stage of society, and by authors whose language was much more copious, and who certainly belonged to a more educated class than the ancient minstrels. Men were no longer satisfied with hearing of hard battles and direful wounds; they demanded at the hand of those who professed to entertain them,

Romance. some insight into nature, or at least into manners; some description of external scenery, and a greater regard to probability both in respect of the characters which are introduced, and the events which are narrated. These new demands the prose romances endeavoured to supply to the best of their power. There was some attention shewn to relieve their story, by the introduction of new characters, and to illustrate these personages by characteristic dialogue. The lovers conversed with each other in the terms of metaphysical gallantry, which were used in real life; and from being a mere rhapsody of warlike feats, the romance began to assume the nobler and more artificial form of a picture of manners. It is in the prose folios of *Lancelot du Lac*, *Perceforest*, and others, that antiquaries find recorded the most exact accounts of fights, tournaments, feasts, and other magnificent displays of chivalric splendour; and as they descend into more minute description than the historians of the time thought worthy of their pains, they are a mine from which the painful student may extract much valuable information. This, however, is not the full extent of their merit. These ancient books, amid many pages of dull repetition and uninteresting dialogue, and notwithstanding the langour of an inartificial, protracted, and confused story, exhibit from time to time passages of deep interest, and situations of much novelty, as well as specimens of spirited and masculine writing. The general reader, who dreads the labour of winnowing out these valuable passages from the sterile chaff through which they are scattered, will receive an excellent idea of the beauties and defects of the romance from Tressan's *Corps d'Extraits de Romans de Chevalerie*, from Mr. Ellis's *Specimens of Early English Romances*, and Mr. Dunlop's *History of Fiction*.

These works continued to furnish the amusement of the most polished courts in Europe, so long as the manners and habits of chivalry continued to animate them. Even the sagacious Catherine of Medicis considered the romance of *Perceforest* as the work best qualified to form the manners and amuse the leisure of a young prince; since she impressed on Charles IX. the necessity of studying it with attention. But by degrees the progress of new opinions in religion, the promulgation of a stricter code of morality, together with the important and animating discussions which began to be carried on by means of the press, diverted the public attention from these antiquated legends. The Protestants of England, and the Huguenots of France, were rigorous in their censure of books of chivalry, in proportion as they had been patronized formerly under the Catholic system; perhaps because they helped to arrest men's thoughts from more serious subjects of occupation. The learned Ascham thus inveighs against the romance of *Morte D'Arthur*, and at the same time acquaints us with its having passed out of fashion: "In our forefathers' tyme, when papestrie, as a standyng poole, covered and overflowed all Englande, fewe bookes were read in our tongue, sayng certayne bookes of chivalrie, as they said for pastime and pleasure; which, as some say, were made in monasteries by idle monks, or wanton chanons. As, for example, *La Morte D'Arthur*, the whole pleasure of which booke standeth in two specciall poyntes, in open manslaughter, and bold bawdrye: in which booke they are counted the noblest knightes that do kill most men without any quarrell, and commit foulest adulteries by sutlest shifts; as Sir Launcelote, with the wife of King Arthur his master; Sir Tristram, with the wife of King Marke his uncle; Sir Lamerocke, with the wife of King Lote, that was his own aunt. This is good stuffe for wise men to laughe at, or honest men to take pleasure at: yet I know, when God's Bible was banished the court, and *La Morte D'Arthur* received into the prince's chamber."¹

The brave and religious La Noue is not more favourable to the perusal of romances than the learned Ascham; at-

¹ Works of Roger Ascham, p. 254. 4to. edition.

Romance-tributing to the public taste for these compositions the decay of morality amongst the French nobility. "The ancient fables whose reliques doe yet remain, namely, *Lancelot of the Lake*, *Pierreforest*, *Tristram*, *Giron the Courteous*, and such others, doe beare witness of this olde vanitie; herewith were men fed for the space of 500 yeeres, untill our language growing more polished, and our mindes more ticklish, they were driven to invent some nouelties wherewith to delight us. Thus came y^e bookes of *Amadis* into light among us in this last age. But to say y^e truth, *Spaine* bred thē, and *France* new clothed thē in gay garments. In y^e daies of *Henrie the Second* did they beare the chieftest sway, and I think if any man woult then have reprov'd thē, he should have been spit at because they were of themselves playfellows and maintainers to a great sort of persons; whereof some, after they had learned to amize in speech, their teeth watered, so desirous were they even to taste of some small morsels of the delicacies therein most livelie and naturally represented."² The gallant Marechal proceeds at considerable length to refute the arguments of those who contended that these books were intended as a spur to the practice of arms and honourable exercises amongst youth, and labours hard to shew that they teach dishonest practices both in love and in arms. It is impossible to suppress a smile when we find such an author as La Noue denouncing the introduction of spells, witchcrafts, and enchantments into these volumes, not because such themes are absurd and nonsensical, but because the representing such beneficent enchanters as Alcuin and Urganda is, in fact, a vindication of those who traffic with the powers of darkness; and that those who love to read about sorceries and enchainments become, by degrees, familiarized with those devilish mysteries, and may at length be induced to have recourse to them in good earnest.

The romances of chivalry did not, however, sink into disrepute under the stern rebuke of religious puritans or severe moralists, but became gradually neglected, as the customs of chivalry itself fell into disregard; when, of course, the books which breathed its spirit, and were written under its influence, ceased to produce any impression on the public mind, and, superseded by better models of composition, and overwhelmed with the ridicule of Cervantes, sunk by degrees into utter contempt and oblivion.

Other works of amusement, of the same general class, succeeded the proper romance of chivalry. Of these we shall take some notice hereafter, since we must here close our general view of the history of romance, and proceed briefly to give some account of those peculiar to the various European nations.

Romances of the different countries of Europe. II. We can here but briefly touch upon a subject of great interest and curiosity, namely, the peculiar character and tone which the romance of chivalry received from the manners and early history of the nations amongst whom it is found to exist; and the corresponding question, in what degree each appears to have borrowed from other countries the themes of their own minstrels, or to have made use of materials common to the whole.

Northern romances. Scandinavia, as was to be expected, may be safely considered as the richest country in Europe, in ancient tales corresponding with the character of romance; sometimes composed entirely in poetry or rhythm, sometimes in prose, and much more frequently in a mixture of prose, narrative, and lyrical effusions. Their well-known Skalds or bards held a high rank in their courts and councils. The character of a good poet was scarcely second to that of a gallant leader, and many of the most celebrated champions ambitiously endeavoured to unite both in their own persons. Their earlier sagas or tales approach to the credit of real history, and were unquestionably meant as such, though, as

usual at an early period, debased by the intermixture of Romance. those *speciosa miracula* which the love of the wonderful early introduces into the annals of an infant country. There are, however, very many of the sagas, indeed by far the greater number of those now known to exist, which must be considered as falling rather under the class of fictitious than of real narratives; and which, therefore, belong to our present subject of inquiry. The *Omeyjinger Saga*, the *Heimskringla*, the *Saga* of Olaf Triggvason, the *Eyrbyggja Saga*, and several others, may be considered as historical; whilst the numerous narratives referring to the history of the Nibelungen and Volsungen are as imaginary as the romances which treat of King Arthur and of Charlemagne. These singular compositions, short, abrupt, and concise in expression, full of bold and even extravagant metaphor, exhibiting many passages of forceful and rapid description, hold a character of their own; and whilst they remind us of the indomitable courage and patient endurance of the hardy Scandinavians, at once the honour and the terror of Europe, rise far above the tedious and creeping style which characterised the minstrel efforts of their successors, whether in France or England. In the pine forests also, and the frozen mountains of the north, there were nursed, amid the reliques of expiring paganism, many traditions of a character more wild and terrible than the fables of classical superstition; and these the gloomy imagination of the skalds failed not to transfer to their romantic tales. The late spirit of inquiry which has been so widely spread through Germany, has already begun to throw much light on this neglected storehouse of romantic lore, which is worthy of much more attention than has yet been bestowed upon it in Britain. It must, however, be remarked, that although the north possesses champions and romances of its own, unknown to southern song, yet, in a later age, the inhabitants of these countries borrowed from the French minstrels some of their most popular subjects; and hence we find sagas on the subject of Sir Tristrem, Sir Percival, Sir Ywain, and others, the well-known themes of French and English romance. These, however, must necessarily be considered later in date, as well as far inferior in interest, to the sagas of genuine northern birth. Mr. Ritson has indeed quoted their existence as depreciating the pretensions of the northern nations to the possession of poems of high antiquity of their own native growth. Had he been acquainted with the *Norman-Kiempe-Datur*, a large folio, printed at Stockholm in 1737, he would have been satisfied, that out of the numerous collection of legends respecting the achievements of Gothic champions, far the greater part are of genuine Norse origin; and although having many features in common with the romances of southern chivalry, are, in other marked particulars, distinctly divided from that class of fictitious composition.

The country of Germany, lying contiguous to France, German romance, and constantly engaged in friendly and hostile intercourse with that great seat of romantic fiction, became, of course, an early partaker in the stores which it afforded. The Minnesingers of the Holy Empire were a race no less cherished than the Troubadours of Provence, or the Minstrels of Normandy; and no less active in availing themselves of their indigenous traditions, or importing those of other countries, in order to add to their stock of romantic fiction. Gotfrid of Strasburg composed many thousand lines upon the popular subject of Sir Tristrem; and others have been equally copious, both as translators and as original authors, upon various subjects connected with French romance; but Germany possessed materials, partly borrowed from Scandinavia, partly peculiar to her own traditional history, as well as to that of the Roman empire, which they applied to the construction of a cycle of heroes as famous

Romance. in Teutonic song as those of Arthur and of Charlemagne in France and Britain.

As in all other cases of the kind, a real conqueror, the fame of whose exploits survived in tradition, was adopted as the central object, around whom were to be assembled a set of champions, and with whose history was to be interwoven the various feats of courage which they performed, and the adventures which they underwent. Theodorick King of the Goths, called in these romantic legends Diderick of Bern (*i. e.* Verona,) was selected for this purpose by the German Minnesingers. Among the principal personages introduced are Ezzel, King of the Huns, who is no other than the celebrated Attila; and Gunter, King of Burgundy, who is identified with a Guntacher of history who really held that kingdom. The good knight Wolfram von Eschenbach seems to have been the first who assembled the scattered traditions and minstrel tales concerning these sovereigns into one large volume of German verse, entitled *Heldenbuch*, or the Book of Heroes. In this the author has availed himself of the unlimited licence of a romancer; and has connected with the history of Diderick and his chivalry a number of detached legends which had certainly a separate and independent existence. Such is the tale of *Segurd the Horny*, which has the appearance of having originally been a Norse saga. An analysis of this singular piece was published by Mr. Weber, in a work entitled *Illustrations of Northern Antiquities from the earlier Teutonic and Scandinavian Romances*; and the subject has been fully illustrated by the publications of the learned Von der Hagen in Germany, and those of the Hon. William Herbert.

It is here only necessary to say, that Theodorick, like Charlemagne and Arthur, is considered in the romance as a monarch more celebrated for the valorous achievements of the brotherhood of chivalry whom he has drawn around him, than for his own, though neither deficient in strength nor courage. His principal followers have each their discriminatory and peculiar attributes. Meister Hildebrand, the Nestor of the band, is, like the Maugis of Charlemagne's heroes, a magician as well as a champion. Hogan, or Hagan, begot betwixt a mortal and a sea-goblin, is the fierce Achilles of the confederation. It is the uniform custom of the romancers to conclude by a general and overwhelming catastrophe, which destroys the whole ring of chivalry whose feats they had commemorated. The ruin which Roncesvalles brought to the Paladins of Charlemagne, and the fatal battle of Camlan to the Knights of the Round Table, fell upon the warriors of Diderick through the revengeful treachery of Crimhilda, the wife of Ezzel; who, in revenge for the death of her first husband, and in her inordinate desire to possess the treasures of the Niflunga or Burgundians, brought destruction on all those celebrated champions. Mr. Weber observes that these German fictions differ from the romances of French chivalry, in the greater ferocity and less refinement of sentiment ascribed to the heroes; and also in their employing to a great extent the machinery of the Duergar, or dwarfs, a subterranean people to whom the *Heldenbuch* ascribes much strength and subtilty, as well as profound skill in the magic art, and who seem, to a certain extent, the predecessors of the European fairy.

Italian romance. Italy, so long the seat of classical learning, and where that learning was first revived, seems never to have strongly embraced the taste for the Gothic romance. They received, indeed, the forms and institutions of chivalry, but the Italians seem to have been in a considerable degree strangers to its spirit, and not to have become deeply enamoured of its literature. There is an old romance of chivalry proper to Italy, called *Guerino the Wretched*, but we doubt if even this be of indigenous growth. Indeed, when they did adopt from the French the fashionable tales of Charlemagne and his Paladins, these did not attract the attention

Romance. of the classical Italians, until Boiardo, Berni, Pulci, and, above all, the divine Ariosto, condescended to use them as the basis of their well-known romantic poems; and thus the fictitious narratives originally composed in metre, and afterwards rewritten in prose, were anew decorated with the honours of verse. The romantic poets of Italy did not even disdain to imitate the rambling, diffuse, and episodical style proper to the old romance; and Ariosto, in particular, although he torments the reader's attention, by digressing from one adventure to another, delights us, upon frequent perusals, by the extreme ingenuity with which he gathers up the broken ends of his narrative, and finally weaves them all handsomely together in the same piece. But the merits and faults of romantic poetry form themselves the fruitful subject of a long essay. We here only notice the origin of those celebrated works, as a species of composition arising out of the old romance, though surpassing it in regularity, as well as in all the beauties of style and diction.

With Spain the idea of romance was particularly connected; and the associations which are formed upon per- Spanish and Portuguese romance using the immortal work of Cervantes, induce us for a long time to believe that the country of Don Quixote must be the very cradle of romantic fiction. Yet, if we speak of priority of date, Spain was amongst the last nations in Europe with whom romance became popular. It was not indeed possible that, among a people speaking so noble and poetical a language, engaged in constant wars, which called forth at once their courage and their genius, there should not exist many historical and romantic ballads descriptive of their rencounters with the Moors. But their native poets seem to have been too much engaged with the events of their own age, and of that which had just preceded it, to permit of their seeking subjects in the regions of pure fiction; and we have not heard of a Spanish metrical romance, unless the poems describing the adventures of the Cid should be supposed to have any affinity to that class of composition. The Peninsula, however, though late in adopting the prevailing taste for romantic fiction, gave origin to one particular class, which was at least as popular as any which had preceded it. *Amadis de Gaul*, the production, it would seem, of Vasco de Lobeira, a Portuguese knight, who lived in the fourteenth century, gave a new turn to the tales of chivalry, and threw into the shade the French prose romances, which, until the appearance of this distinguished work, had been the most popular in Europe.

The author of *Amadis*, in order, perhaps, to facilitate the other changes which he introduced, and to avoid rushing against preconceived ideas of events or character, laid aside the worn-out features of Arthur and Charlemagne, and imagined to himself a new dynasty both of sovereigns and of heroes, to whom he ascribed a style of manners much more refined, and sentiments much more artificial, than had occurred to the authors of *Perceval* or *Perceforest*. Lobeira had also taste enough to perceive, that some unity of design would be a great improvement on the old romance, where one adventure is strung to another with little connection from the beginning to the end of the volume; which thus concluded, not because the plot was winded up, but because the author's invention, or the printer's patience, was exhausted. In the work of the Portuguese author, on the contrary, he proposes a certain end, to advance or retard which all the incidents of the work have direct reference. This is the marriage of Amadis with Oriana, against which a thousand difficulties are raised by rivals, giants, sorcerers, and all the race of evil powers unfavourable to chivalry; whilst these obstacles are removed by the valour of the hero, and constancy of the heroine, succoured on their part by those friendly sages, and blameless sorceresses, whose intervention gave so much alarm to the tender-conscienced De la Noue. Lobeira also displayed considerable attention to the pleasure which arises from the contrast of character;

Romance. and to relieve that of Amadis, who is the very essence of chivalrous constancy, he has introduced Don Galaor, his brother, a gay libertine in love, whose adventures form a contrast with those of his more serious relative. Above all, the *Amadis* displays an attention to the style and conversation of the piece, which, although its effects are now exaggerated and ridiculous, was doubtless at the time considered as the pitch of elegance; and here were, for the first time, introduced those hyperbolical compliments, and that inflated and complicated structure of language, the sense of which walks as in a masquerade.

The *Amadis* at first consisted only of four books, and in that limited shape may be considered as a very well conducted story; but additions were speedily made which extended the number to twenty-four; containing the history of Amadis subsequent to his obtaining possession of Oriana, and down to his death, as also of his numerous descendants. The theme was not yet exhausted; for, as the ancient romancers, when they commenced a new work, chose for their hero some newly invented Paladin of Charlemagne, or knight of King Arthur, so did their successors adopt a new descendant of the family of Amadis, whose genealogy was thus multiplied to a prodigious degree. For an account of *Esplandian*, *Florimond of Greece*, *Palmerin of England*, and the other romances of this class, the reader must be referred to the valuable labours of Mr. Southey, who has abridged both *Amadis* and *Palmerin*, with the most accurate attention to the style and manners of the original. The books of *Amadis* became so very popular, as to supersede the elder romances almost entirely, even at the court of France, where, according to La Noue, already quoted, they were introduced about the reign of Henry II. It was against the extravagance of these fictions in character and in style, that the satire of Cervantes was chiefly directed; and almost all the library of Don Quixote belongs to this class of romances, which, no doubt, his adventures contributed much to put out of fashion.

French Romance.

In every point of view, France must be considered as the country in which chivalry and romance flourished in the highest perfection; and the originals of almost all the early romances, whether in prose or in verse, whether relating to the history of Arthur or of Charlemagne, are to be found in the French language; and other countries possess only translations from thence. This will not be so surprising when it is recollected, that these earlier romances were written, not only for the use of the French, but of the English themselves, among whom French was the prevailing language during the reigns of the Anglo-Norman monarchs. Indeed, it has been ingeniously supposed, and not without much apparent probability, that the fame of Arthur was taken by the French minstrels for the foundation of their stories in honour of the English kings, who reigned over the supposed dominions of that British hero; while, on the other hand, the minstrels who repaired to the coast of France, celebrated the prowess of Charlemagne and his twelve peers as a subject more gratifying to those who sat upon his throne. It is perhaps, some objection to this ingenious theory, that, as we have already seen, the battle of Hastings was opened by a minstrel, who sung the war-song of Roland, the nephew of Charlemagne; so that the Norman duke brought with him to England the tales that are supposed, at a much later date, to have been revived to soothe the national pride of the French minstrels.

How the French minstrels came originally by the traditional reliques concerning Arthur and Merlin, on which they wrought so long and so largely, must, we fear, always remain uncertain. From the Saxons we may conclude they had them not; for the Saxons were the very enemies against whom Arthur employed his good sword *excalibar*, that is to say, if there was such a man, or such a weapon. We know, indeed, that the British, like all the branches of the Celtic

Romance. race, were much attached to poetry and music, which the numerous relics of ancient poetry in Wales, Ireland, and the Highlands of Scotland, sufficiently evince. Arthur, a name famous amongst them, with some traditions concerning the sage Merlin, may have floated either in Armorica, or among the half-British of the borders of Scotland, and of Cumberland; and thus preserved, may have reached the ear of the Norman minstrels, either in their newly conquered dominions, or through their neighbours of Brittany. A theme of this sort once discovered, and found acceptable to the popular ear, gave rise, of course, to a thousand imitations; and gradually drew around it a cloud of fiction which, embellished by such poetry as the minstrels could produce, arranged itself by degrees into a system of fabulous history, as the congregated vapours touched by the setting sun, assume the form of battlements and towers. We know that the history of Sir Tristrem, first versified by Thomas the Rhymer of Erceldoune, was derived from Welsh traditions, though told by a Saxon poet. In fact, it may be easily supposed, that the romancers of that early period were more eager to acquire popular subjects than delicately scrupulous of borrowing from their neighbours; and when the foundation-stone was once laid, each subsequent minstrel brought his contribution to the building. The idea of an association of knights assembled around one mighty sovereign, was so flattering to all the ruling princes of Europe, that almost all of them endeavoured to put themselves at the head of some similar institution, and the various orders of chivalry are to be traced to this origin. The historical foundation of this huge superstructure is almost imperceptible. Mr. Turner has shewn that the evidence rather inclines to prove the actual existence of King Arthur; and the names of Gawain, his nephew, and of Guenora, his faithful spouse, of Mordred, and Merlin, were preserved by Welsh tradition. To the same source may be referred the loves of Tristrem and Ysolde, which, although a separate story, has become, in the later romances, amalgamated with that of Arthur. But there can be little doubt that all beyond the bare names of the heroes owes its existence to the imagination of the romancers.

It might be thought that the romances referring to the feats of Charlemagne ought to contain more historical truth than those concerning Arthur; since the former relate to a well-known monarch and conqueror, the latter to a personage of a very doubtful and shadowy existence. But the romances concerning both are equally fabulous. Charles had, indeed, an officer named Roland, who was slain with other nobles in the field of Roncesvalles, fighting, not against the Saracens or Spaniards, but against the Gascons. This is the only point upon which the real history of Charlemagne coincides with that invented for him by romancers. Roland was prefect of Bretagne, and his memory was long preserved in the war-song which bore his name. A fabulous chronicler, calling himself Turpin, compiled, in or about the eleventh century, a romantic history of Charlemagne; but it may be doubted whether, in some instances, he has not availed himself of the fictions already devised by the early romancers, while to those who succeeded them his annals afforded matter for new figments. The personal character of Charlemagne has suffered considerably in the hands of the romantic authors, although they exaggerated his power and his victories. He is represented as fond of flattery, irritable in his temper, ungrateful for the services rendered him by his most worthy paladins, and a perpetual dupe to the treacherous artifices of Count Gam, or Ganelon, of Mayence; a renegade, to whom the romancers impute the defeat at Roncesvalles, and all the other misfortunes of the reign of Charles. This unfavourable view of the prince, although it may bear some features of royalty, neither resembles the real character of the conqueror of the Saxons and Lombards, nor can be easily reconciled with the

Romance. idea, that he was introduced to flatter the personal vanity of the princes of the Valois race, by a portrait of their great predecessor.

The circumstance that Roland was a lieutenant of Brittany, and the certainty that Marie borrowed from that country the incidents out of which she composed her lays, seems to fortify the theory, that the French minstrels obtained from that country much of their most valuable materials; and that, after all that has been said and supposed, the history of Arthur probably reached them through the same channel.

The Latin writers of the middle ages afforded the French romancers the themes of those metrical legends which they have composed on subjects of classical fame.

The honour of the prose romances of chivalry, exclusive always of the books of Amadis, belongs entirely to the French, and the curious volumes which are now the object of so much research amongst collectors, are almost universally printed at Paris.

English
romance.

England, so often conquered, yet fated to receive an accession of strength from each new subjugation, cannot boast much of ancient literature of any kind; and, in the department of which we treat, was totally inferior to France. The Saxons had, no doubt, romances (taking the word in its general acceptation); and Mr. Turner, to whose researches we are so much indebted, has given us the abridgment of one entitled *Caedmon*, in which the hero, whose adventures are told much after the manner of the ancient Norse Sagas, encounters, defeats, and finally slays an evil being called Grendel, who, except in his being subject to death, seems a creature of a supernatural description. But the literature of the Saxons was destroyed by the success of William the Conqueror, and the Norman knights and barons, among whom England was in a great measure divided, sought amusement, not in the lays of the vanquished, but in those composed in their own language. In this point of view, England, as a country, may lay claim to many of the French romances, which were written, indeed, in that language, but for the benefit of the court and nobles of England, by whom French was still spoken. When the two languages began to assimilate together, and to form the mixed dialect termed the Anglo-Norman, we have good authority for saying that it was easily applied to the purpose of romantic fiction, and recited in the presence of the nobility.

Robert de Brunne, who composed his *History of England* about this time, has this remarkable passage, which we give, along with the commentary of the editor of *Sir Tristrem*, as it is peculiarly illustrative of the subject we are inquiring into.

Als thai haf wryten and sayd,
Haf I alle in myn Inglis layd,
In symple speche as I couthe,
That is lightest in manne's mouthe.
I mad nought for no disours,
Ne for no seggours, no harpours,
Bot for the luf of symple men,
That strange Inglis cannot ken;
For many it ere that strange Inglis,
In ryme wate never what it is;
And bot thai wist what it mente,
Ellis methought it were alle schente.
I made it not for to be praysed,
Bot at the lewed men were aysed.
If it were made in ryme couwee,
Or in strangere, or enterlaced,
That rede Inglis it ere inowe
That couthe not haf coppled a kowe,
That outhur in couwee or in baston
Sum suld haf ben fardon;
So that fele men that it herde
Suld not witte howe that it ferde
I see in song, in sedgeyng tale,
Of Erceldoun and of Kendale,

Non tham sayis as thai tham wroght,
And in ther saying it semes noght.
That may thou here in Sir Tristrem,
Over gestes it has the steem,
Over all that is or was,
If men it sayd as made Thomas.
Bot I here it no man so say,
That of some copple som is away.
So thare fayie saying heie beforene,
Is thare travayle nere forlorne;
Thai sayd it for pride and nobleye,
That were not suylke as thei,
And alle that thai wild overwhere,
Alle that ilk wille now forfare.
Thai sayd it in so quainte Inglis,
That manyone wate not what it is.
Therfore heuyed wele the more
In stange ryme to travayle sore,
And my wit was ouie thyryne,
So strange speche to travayle in,
And forsoth I couth noght
So stange Inglis as thai wroght,
And men besoght me many a tyme
To tune it bot in light ryme.
Thai seyde, if I in stange ryme it turn,
To heie it manyon suld skorne;
For in it ere names fulle selcouthe,
That ere not used now in mouthe.
And therfore, for the comonalte,
That blythely wild listen to me,
On light lunge I it began,
For luf of the lewed man.

Romance.

"This passage requires some commentary, as the sense has been generally mistaken. Robert de Brunne does not mean, as has been supposed, that the minstrels who repeated Thomas's romance of *Sir Tristrem*, disguised the meaning by putting it into *quainte Inglis*; but, on the contrary, that Kendal and Thomas of Erceldoune did themselves use such *quainte Inglis*, that those who repeated the story were unable to understand it, or to make it intelligible to their hearers. Above all, he complains that, by writing an intricate and complicated stanza, as '*ryme couwee, strangere, or entrelacé*,' it was difficult for the *diseurs* to recollect the poem; and of *Sir Tristrem*, in particular, he avers, that he never heard a perfect recital, because of some one '*copple*' or stanza, a part was always omitted. Hence he argues at length, that he himself, writing not for the minstrel or harper, nor to acquire personal fame, but solely to instruct the ignorant in the history of their country, does well in chusing a simple structure of verse, which they can retain correctly on their memory, and a style which is popular and easily understood. Besides which, he hints at the ridicule he might draw on his poem, should he introduce the uncouth names of his personages into a courtly or refined strain of verse. They were

Great names, but hard in verse to stand.

While he arrogates praise to himself for his choice, he excuses Thomas of Erceldoune and Kendale for using a more ambitious and ornate kind of poetry. They wrote, he says, for pride (fame) and for nobles, not such as these my ignorant hearers.¹

If the editor of *Sir Tristrem* be correct in his commentary, there existed in the time of Robert de Brunne, minstrels or poets who composed English poetry to be recited in the presence of the great, and who, for that purpose, used a singularly difficult stanza, which was very apt to be mutilated in recitation. *Sir Tristrem*, even as it now exists, shows likewise that considerable art was resorted to in constructing the stanza, and has, from beginning to end, a concise, quaint, abstract turn of expression, more like the Saxon poetry, than the simple, bald, and diffuse details of the French minstrel. Besides *Sir Tristrem*, there remain, we

¹ *Sir Tristrem*, Introduction, pp. 61-65. Edin. 1804.

Romance. conceive, at least two other examples of "gestes written in quaint Inglis" composed, namely, according to fixed and complicated rules of verse, and with much attention to the language, though the effect produced is far from pleasing. They are both of Scottish origin, which may be explained, by recollecting, that in the Saxon provinces of Scotland, as well as at the court, Norman was never generally used; and therefore it is probable that the English language was more cultivated in that country at an early period, than in England itself, where, among the higher orders, it was for a long time superseded by that of the French conquerors. These romances, entitled *Sir Gawain*, and *Sir Gologras*, and *Sir Gaherian of Galloway*, have all the appearance of being original compositions, and display considerable poetical effort. But the uncouth use of words dragged in for the sake of alliteration, and used in secondary and oblique meanings, renders them extremely harsh in construction, as well as obscure in meaning.

In England it would seem that the difficulties pointed out by De Brunne, early threw out of fashion this ornate kind of composition; and the English minstrels had no readier resource than translating from the French, who supplied their language at the same time with the phrases of chivalry which did not exist in English. These compositions presented many facilities to the minstrel. He could, if possessed of the slightest invention, add to them at pleasure, and they might as easily be abridged when memory failed, or occasion required. Accordingly, translations from the French fill up the list of English romance. They are generally written in short lines rhyming together; though often, by way of variety, the third and sixth lines are made to rhyme together, and the poem is thus divided into stanzas of three couplets each. In almost all of these legends, reference is made to "the romance," that is, some composition in the French language, as to the original authority. Nay, which is very singular, tales where the subjects appear to be of English growth, seem to have yet existed in French ere they were translated into the language of the country to which the heroes belonged. This seems to have been the case with *Hornchilde*, with *Guy of Warwick*, with *Bevis of Hampton*, all of which appear to belong originally to England; yet are their earliest histories found in the French language, or at least the vernacular versions refer to such for their authority. Even the romance of *Richard*, England's own *Cœur de Lion*, has perpetual references to the French original from which it was translated. It must naturally be supposed that these translations were inferior to the originals; and whether it was owing to this cause, or that the composition of these rhymes was attended with too much facility, and so fell into the hands of very inferior composers, it is certain, and is proved by the highest authority, that of Chaucer himself, that even in his time these rhyming romances had fallen into great contempt. The *Rime of Sir Thopas*, which that poet introduces as a parody, undoubtedly, of the rhythmical romances of the age, is interrupted by mine host Harry Bailly, with the strongest and most energetic expressions of total and absolute contempt. But though the minstrels were censured by De Brunne, for lack of skill and memory, and the poems which they recited were branded as "drafty rhymings," by the far more formidable censure of Chaucer, their acceptance with the public in general must have been favourable, since, besides many unpublished volumes, the two publications of Ritson and Weber bear evidence of their popularity. Some original compositions doubtless occur among so many translations, but they are not numerous, and few have been preserved. The poem of *Sir Eger* and *Sir Greme*, which seems of Scottish origin, has no French original; nor has any been discovered either of the *Squire of Low Degree*, *Sir Eglamour*, *Sir Pleindamour*, or some others. But the French derivation of the two last names renders it probable that such may exist.

The minstrels and their compositions seem to have fallen

Romance. into utter contempt about the time of Henry VIII. There is a piteous picture of their condition in the person of Richard Sheale, which it is impossible to read without compassion, if we consider that he was the preserver at least, if not the author of the celebrated heroic ballad of *Cherry Chace*, at which Sir Philip Sidney's heart was wont to beat as at the sound of a trumpet. This luckless minstrel had been robbed on Dunsmore Heath, and, shame to tell, he was unable to persuade the public that a son of the Muses had ever been possessed of the sixty pounds which he averred he had lost on the occasion. The account he gives of the effect upon his spirits is melancholy, and yet ridiculous enough.

After my robbery my memory was so decayde,
That I colde neather syng, nor talke, my wyttys wer so dismayde,
My audacine was gone, and all my myrry tawke.
Ther ys sum heare have sene me as myrry as a hawke;
But nowe I am so trublyde with phansis in my mynde,
That I cannot play the myrry knave, accordyng to my kynd.
Yet to tak thought, I perseve, ys not the next waye
To bring me out of det, my creditors to paye.
I may well say that I hade but well hape,
For to lose about threscore pounde at a clape.
The losse of my mony did not greve me so soie,
But the talke of the pyple dyde greve me moch mor.
Sum sayde I was not robde, I was but a lyeng knave,
Yt was not possyble for a mynstrell so much mony to have.
In dede, to say the truthe, that ys ryght well knowene,
That I never had so moche mony of myn owene,
But I had fiendds in London, whos namys I can declare,
That at all tymes wold lende me cc lds. worth of ware,
And sum agayn such frendship I founde,
That thei wold lend me in mony nyn or tene pownde.
The occasion why I cam in dete I shall make relacion,
My wyff in dede ys a sylk woman be her occupation,
And lyuen cloths most chefly was her greatyste trayd,
And at faris and merkytts she solde sale-ware that she made;
As shertts, smockys, purtytts, hede clothes, and othar thungge,
As sylk thredd, and eggynge, skyrts, bandds, and stynge.

From *The Chant of Richard Sheale*,
British Bibliographer, No. xiii. p. 101.

Elsewhere, Sheale hints that he had trusted to his harp, and to the well known poverty attached to those who used that instrument, to bear him safe through Dunsmore Heath. At length the order of English minstrels was formally put down by the act 39th of Queen Elizabeth, classing them with sturdy beggars and vagabonds; in which disgraceful fellowship they only existed in the capacity of fiddlers, who accompanied their instrument with their voice. Such a character is introduced in the play of *Monsieur Thomas*, as the "poor fiddler who says his songs." The metrical romances which they recited also fell into disrepute, though some of the more popular, sadly abridged and adulterated, continued to be published in *chap. books*, as they are called. About fifty or sixty years since, a person acquired the nickname of *Rosewal and Lilian*, from singing that romance about the streets of Edinburgh, which is probably the very last instance of the proper minstrel craft.

If the metrical romances of England can boast of few original compositions, they can show yet fewer examples of the prose romance. Sir Thomas Malory, indeed, compiled, from various French authorities, his celebrated *Morte d'Arthur*, indisputably the best prose romance the language can boast. There is also *Arthur of Little Britain*; and the Lord Berners compiled the romance of the *Knight of the Swan*. The books of Amadis were likewise translated into English; but it may be doubted whether the country in general ever took that deep interest in the perusal of these records of love and honour with which they were greeted in France. Their number was fewer; and the attention paid to them in a country where great political questions began to be agitated, was much less than when the feudal system still continued in its full vigour.

III. We should now say something on those various kinds

Romance. of romantic fictions which succeeded to the romance of chivalry. But we can only notice briefly works which have long slumbered in oblivion, and which certainly are not worthy to have their slumbers disturbed.

Pastoral romance. Even in the time of Cervantes, the pastoral romance, founded upon the *Diana* of George of Monte Mayor, was prevailing to such an extent as made it worthy of his satire. It was, indeed, a system still more remote from common sense and reality than that of chivalry itself. For the maxims of chivalry, high-strained and absurd as they are, did actually influence living beings, and even the fate of kingdoms. If *Amadis de Gaul* was a fiction, the Chevalier Bayard was a real person. But the existence of an Arcadia, a pastoral region, in which a certain fantastic sort of personages, desperately in love, and thinking of nothing else but their mistresses, played upon pipes, and wrote sonnets from morning to night, yet were supposed all the while to be tending their flocks, was too monstrously absurd to be long credited or tolerated.

Heroic romances. A numerous, and once most popular class of fictions, was that entitled the heroic romance of the seventeenth century.

If the ancient romance of chivalry has a right to be called the parent of those select and beautiful fictions which the genius of the Italian poets has enriched with such peculiar charms, another of its direct descendants, the heroic romance of the seventeenth century, is, with few exceptions, the most dull and tedious species of composition that ever obtained temporary popularity. The old romance of Heliodorus, entitled *Theagenes and Chariclea*, supplied perhaps the earliest model of this style of composition; but it was from the romances of chivalry that it derives its most peculiar characteristics. A man of a fantastic imagination, Honoré d'Urfé, led the way in this style of composition. Being willing to record certain love intrigues of a complicated nature which had taken place in his own family, and among his friends, he imagined to himself a species of Arcadia on the banks of the Lignon, who live for love, and for love alone. There are two principal stories, said to represent the family history of D'Urfé and his bro-

ther, with about thirty episodes, in which the gallantries and intrigues of Henry IV.'s court are presented under borrowed names. Considered by itself, this is but an example of the pastoral romance; but it was so popular that three celebrated French authors, Gomberville, Calprenède, and Madame Scudéri, seized the pen, and composed in emulation many interminable folios of heroic romance. In these insipid performances, a conventional character, and a set of family manners and features, are ascribed to the heroes and heroines, although selected from distant ages, and various quarters of the world. The heroines are, without exception, models of beauty and perfection; and, so well persuaded of it themselves, that to approach them with the most humble declaration of love, was a crime sufficient to deserve the penalty of banishment from their presence; and it is well if the doom were softened to the audacious lover, by permission, or command to live, without which, absence and death were to be accounted synonymous. On the other hand, the heroes, whatever kingdoms they have to govern, or other earthly duties to perform, live through these folios for love alone; and the most extraordinary revolutions which can agitate the world, are ascribed to the charms of a Mandana, or a Statira, acting upon the crazy understanding of their lovers. Nothing can be so uninteresting as the frigid extravagance with which these lovers express their passion; or, in their own phrase, nothing can be more freezing than their flames, more creeping than their flights of love. Yet the line of metaphysical gallantry which they exhibited, had its date, and a long one, both in France and England. In the latter country they continued to be read by our grandmothers during the Augustan age of English; and while Addison was amusing the world with his wit, and Pope by his poetry, the ladies were reading Clelia, Cleopatra, and the Grand Cyrus. The fashion did not decay till about the reign of George I.; and even more lately, Mrs. Lennox, patronized by Dr. Johnson, wrote a very good imitation of Cervantes, entitled *The Female Quixote*, which had those works for its basis. They are now totally forgotten. (W.S.—TT.)

MODERN ROMANCE AND NOVEL.

We alluded in the commencement of this essay, to the division of fictitious narratives in prose, into two classes; the *romance*, in which the interest of the narrative turns chiefly on marvellous and uncommon incidents; and the *novel*, in which the events are accommodated to the ordinary train of human events, and the modern state of society.

The rise of this last department of fictitious composition in England, takes place about the commencement of the eighteenth century; and its coincidence with the decline of the drama is remarkable. The novel aspired, in fact, to perform for a reading and refined age, what the drama had done for a ruder and more excitable period; to embody the spirit of the times in pictures at once amusing and accurate, and in the form best calculated to awaken attention and interest in those to whom they are addressed. In the earlier periods of a national literature, while the poetical and imaginative spirit of the time takes the direction of the long prose romance, the task of painting manners, and satirizing follies, and displaying the comic oddities of character, is most efficiently performed by the drama. Its strength, terseness, and brevity, with the aid of action and scenery, present the manners living as they rise, with abundance of force at least, and probably, for a time, with sufficient fidelity. But as society becomes more decorous, and peculiarities of manners less marked, the pictures exhibited by the stage are apt to become less true; for dramatic effect appears to demand something more stimulating than reality affords; and hence the drama, with a pardonable leaning to the principle of stage effect, often continues to reproduce the man-

ners, vices, and humours of a preceding age, long after they have ceased to exist, merely because they are found better adapted to that broad and strongly-coloured delineation in which it chiefly deals. Thus, though the age of Vanburgh, Congreve, and Wycherley, was probably not a very moral age, and the tone even of its polite conversation, would probably appear somewhat questionable to modern ears, there seems to be no reason to believe that the universal profligacy of manners, and boundless licence of conversation which are exhibited in the comedies of these writers, really characterised the period at which they wrote. Their Wildairs, Sir John Brutes, Lady Touchwoods, and Mrs. Frails, are conventional reproductions of those wild gallants and demireps which figure in the licentious dramas of Dryden and Shadwell. They represented the manners and the morals of an age gone by; and the audiences who tolerated these indecencies for the sake of the wit by which they were occasionally redeemed, would have been revolted by their exaggeration and incorrectness, if they had looked upon them as exhibitions of society as it existed. The drama, then, had ceased to be the mirror in which the age could contemplate itself, and exhibited the license of a masque, or the extravagance of a caricature, much more than the sobriety of actual life, or the fidelity of a portrait. Besides, there are many lesser traits of character, many sentiments and feelings, which are not at all dramatic, and which had therefore been overlooked by writers for the stage, yet in themselves highly interesting and curious, and capable, when judiciously employed, of exercising a strong influence on the feelings. These become more prominent, and stand out in brighter relief, as the restraints of civilization gradu-

Rise of novel writing in England.

The novel a substitute for the drama.

Romance. ally throw into the background the wilder passions and more stormy impulses of our nature, until they acquire an importance which not only justifies, but renders their introduction into any fictitious narrative which represents the peculiarities of the time, necessary; and for this purpose, the calm and even march of the novel, and the detailed development both of sentiment and incident which it allows, is found to be admirably adapted. It is in the works of our novelists, therefore, rather than our dramatists, and in those passages in our essayists of Queen Anne's time, in which they treat of past fashions, manners, whims, and humours, that we must look for the changes which society has undergone, and from which we must try to realize to ourselves the features which it exhibited at any particular period.

Field of the novel wider than the drama.

The novel, then, affords a wider field for accurate and complete delineation of passions and feelings than the drama, and certainly one more in harmony with the dispositions of a modern public. In powerful effects no doubt it cannot compete with the stage. The whole range of novel or romance contains nothing, for instance, which in its tremendous impression, can be compared with the explosion of passion in the third act of *Othello*; but, on the other hand, it has greatly the advantage in the impression of verisimilitude which it leaves behind, produced by the accumulation of many particulars and minute traits of character; in pleasing interchanges of action and repose; in the delineation of emotions, which the drama, speaking only to the eye and the ear, cannot lay before us; in the descriptions of external scenery, which, in the hand of a writer of genius, are far more effective, when presented in words to the imagination, than when counterfeited to the eye upon the stage, even by all the united resources of the scene-painter and the mechanist; and which, from the strong connection that exists between the state of our feelings and external influences, are found in the hands of a judicious novelist to afford powerful materials for deepening the pervading tone of sentiment which he aims to produce; just as in painting relief and effect are obtained by the tone and character of the background against which the figures are opposed. Another advantage obtained by the substitution of narrative fiction for the drama, was, that a much wider licence was obtained in the conduct of the plot. A good plot is no doubt as essential to the novel as the drama; but the kind of plot which may be used with effect in each, and the manner in which the incidents are to be conducted, differ materially. A play in which every scene does not grow out of the preceding, and lead directly into the next, with a visible progress of plot, is in that respect faulty. On the contrary, in the novel and romance, as in real life, much is admissible which is episodic, which does not directly help forward nor produce the catastrophe, but merely tends to bring out some point of character in the personages represented, or to increase the air of verisimilitude in the main story, by the appearance of minute and literal correctness in the details. In the novel or romance, too, it has been generally remarked that the catastrophe may be made to turn upon accident, but that this is inadmissible in the drama.¹ Thus the catastrophe in the *Bride of Lammermoor*, where Ravenswood is swallowed up by a quicksand, is singularly grand in romance, but would be inadmissible in a drama. And on the same principle, Schiller has, in his *Fiesco*, thought himself compelled to deviate from the actual truth of history, and to ascribe the Count's death, not to an accidental stumble from a plank, but to the hand of the republican Verrina. In a novel, the real catastrophe would have been far more impressive in its moral effect than the imaginary one; but Schiller held, and we think rightly, that in the drama nothing must be *accident*, but every thing *result*. Although, as compared with the romance, the term novel

Blending of the novel and romance.

may be said to indicate a class of fictions dealing more with calm feelings, and with manners and humours, than with strong passions, and deriving its interest more from the probability than the marvellous nature of its incidents, this definition is not to be taken too literally; for there are many works which we might call novels, in as much as the scene is laid in modern times, and the general course of the incidents is that of every-day life, but in which the even tenor of the story is occasionally broken by scenes of powerful passion, or incidents of a mysterious and terrible character, elevating the composition for the time into the sphere of the romantic; so that perhaps the word tale, as a middle term between the others, would most appropriately describe them. It has been doubted whether, although such a union of the common-place with the extraordinary, be not unfrequently met with in the course of real life, a more cautious separation of these elements would not, on the whole, be most favourable to the effect of a narrative as a work of art; and whether the attempt to blend them, does not produce in fiction, something of that illegitimate effect which is the result of the melo-drama on the stage. It is certain, however, that the tendency for some time past, and particularly since the school of fiction introduced by Sir Walter Scott, has been towards a mixture of the novel and romance in the same composition, so that broad comedy is often found alternating with the pathetic, the gaiety of a ball-room with midnight murders upon lonely heaths, and the disclosure of some piece of fashionable scandal standing side by side with the discovery of some secret and fearful crime. In the hands of our great masters of fiction, we admit the fine effect which these occasionally produce. Judiciously arranged, these opposites are the light and shadow of the composition; but even in our greatest modern novelist, we could point out not a few instances in which this sort of contrast is carried too far; while in many of his imitators, it is so regularly and mechanically introduced, that, as in the case of Mr. Puff's stage arrangements, we can always predict that the discharge of cannon will be followed by soft music.

When the declining popularity of the pastoral and heroic romance of the seventeenth century, suggested the necessity of opening a new vein in fiction, it is probable that the stilted, unnatural, and exaggerated character of those effete compositions led the public taste, by a natural recoil of feeling, into the opposite extreme, viz. the selection of topics and characters from common, and even from vulgar life, and a literal adherence to nature, even at the risk of the sacrifice of art. For we pass over the tiresome and licentious love stories of Mrs. Aphra Behn, with the just remark of Sir Richard Steele, that the lady appears to have "understood the practical part of love better than the speculative," as well as those of her imitator, Mrs. Heywood, in which the struggle between the high sentimental character of the heroic romance, and the growing taste for a style of portraiture more true to the life, is very obvious, and come at once to the writer by whom the inspiration of reality was carried to its greatest perfection.

Defoe, (1661—1731) without high imagination, with no power of raising the passions, with little pathos and no eloquence, had yet that peculiar genius which enabled him to excel within the peculiar department which he chose for himself; that of counterfeiting homely truth by fiction, and forging, as it were, the handwriting of nature herself, with a dexterity which defied detection. Whether Defoe was led to the selection of his peculiar themes, by a real sympathy with roguery, (and his conduct in regard to the well-known imposture of Mrs. Veal's Ghost would justify us in believing him to be like Gil Blas, "tant soi peu fripon;") or by the influence of the Spanish romances of roguery, such as Lazaro de Tormes, Marcos de Obregon,

¹ See some valuable papers on Art in Fiction, ascribed, we believe with justice, to Sir L. Bulwer. *Monthly Chronicle*, Nos. i and ii.

Romance. and Gusman d'Alfarache, with some of which it is highly probable that he was acquainted through translations; or whether his strong vulgar likenesses of seafaring personages, half privateer, half mariner, and his fondness for the delineation of equivocal characters of all kinds, arose from his familiarity with the one class, through his residence at Limehouse, and his acquaintance with Dampier,—and with the other, from his long and frequent imprisonments;—it is certain that though he had no intention of favouring immorality, he yet enters upon the delineation of personages, and scenes of roguery, low profligacy and vice, with a degree of curiosity and complacency, and dwells upon them with a fondness and minuteness of detail, altogether uncommon, and not a little unaccountable in a person who in his opinions savoured of the puritan. This strange labour of love, and study of the morbid anatomy of society, has resulted in a series of night pieces from the haunts of crime, which, though sombre and gloomy in a high degree, and little suited to a cultivated taste, nay, indeed, frequently producing on the mind the painful effect of a real chapter from the *Newgate Calendar*, yet display the most wonderful invention and keeping in all their parts, and a coherence and dexterity of adaptation to each other, which render the ordinary tests by which we endeavour to discriminate a fictitious from a real narrative, inadequate or altogether inapplicable to these singular compositions of Defoe. Whatever might be the motive of his humility of choice, Defoe, like many of his favourite heroes, was perfectly contented to take up his abode in the back settlements of fiction, and was most at home in that Alsatia of Romance, the purlieu of which, by common consent, his more ambitious predecessors had sedulously avoided, as discreditable or dangerous. The transition from their refined Orondates' and Statiras, to the society of the *Captain Jack* and *Moll Flanders* of Defoe, is, to use a phrase of Sterne, like turning from Alexander the Great to Alexander the coppersmith. In his novels, we rarely meet with any thing more exalted or respectable, than masters of trading vessels, dealers in small wares, supercargoes, or, it may be, pickpockets, pirates, candidates for the plantations, or *emeriti* who have already obtained that distinction. In the foreground, we have the cabin, the night cellar, the haunts of fraud, or the round-house; in the distance, Newgate, or Execution Dock. There can be but one opinion, however, as to the wonderful air of veracity, resembling that of a deposition upon oath, which Defoe has imparted to his fictitious creations, and which his genius effects, mainly by accumulation of details, *non vi sed saepe cadendo*; often even by the introduction of a multitude of irrelevant particulars and repetitions, just as in the conversation of uneducated persons in real life. Accordingly the result, as a simulacrum of reality, is one of magical deception. Lord Chatham, it is well known, took his *Memoirs of a Cavalier* for a real history; Dr. Mead believed his *Journal of the Plague* to be the work of a medical man, and his impudent but most plausible history of the apparition of Mrs. Veal, being received by many sober-minded persons as an actual apocalypse from the spiritual world, was the means, as is well known, of disposing of an unsaleable edition of Drelincourt upon death.

But notwithstanding this peculiar power of stamping the impression of reality upon the coinage of his imagination, which, to say the truth, was seldom of the finest metals, it may be safely affirmed, that but for his *Robinson Crusoe*, Defoe would scarcely now be remembered as a writer of fiction. The charm of that work, the first part of which appeared in 1719, is, that it emancipates us from those low haunts and questionable society with which his other novels make us acquainted. We escape from the fumes of tobacco and strong waters, to breathe a purer air on that lone island placed far amidst the melancholy main, where he has imprisoned his shipwrecked mariner; and while Defoe's unrivalled power of inventing a series of probable minutiae, both

in the way of reflexion and incident, enables him to conduct with consummate skill, what we may call the self-education of Crusoe in his solitude,—the process by which he adapts himself to his situation, and the gradual triumphs which, by his ingenuity and patience, he obtains over the difficulties and privations by which he is surrounded, till he changes desolation into comfort;—the imagination of the writer is visibly raised beyond its usual grovelling level by the romance of the situation which he describes. His genius imbibes the spirit of the place; it imparts to the cave of the sailor, something of the seclusion and purity of a hermitage; till the simple train of reflections which he puts into the mouth of his uneducated mariner, upon the sublimity and awfulness of solitude, impress the mind more than the most eloquent declamation. It is a fine proof how completely Defoe has succeeded in interesting us for the solitary being to whom he has given a poetical life, and attuned the mind of his readers to that sentiment of silence and unbroken repose which is breathed over the scene of his imprisonment,—“where all the air a solemn stillness holds,”—that after a time the least incident which threatens to disturb the security of the cave, or the solitude of the island, assumes importance in our eyes, and the groan of an old goat expiring in a cave, or the print of a man's foot in the sand, awaken a feeling of suspense and anxiety which many a writer has in vain laboured to excite by a prodigal expenditure of the machinery of terror.

That *Robinson Crusoe* may be considered in a great measure as a fortunate accident, and that its main charm arises from the more poetical and refined character which the nature of the story and its locality almost necessarily impressed upon it, is indeed evident from the visible inferiority of the second part, where the seclusion of the scene is broken in upon, and Defoe peoples the island with his usual retinue of planters and ship's captains; a production which scarcely rises above the level of his *Captain Singleton*.

The application of the same principle of producing effect by minuteness of detail rather than by grasp, or the selection of a few marking traits, is visible in our next great novelist, Richardson (1689–1761,) but the principle is applied in a different and higher way. Defoe was satisfied with weaving chains of probable incidents, which might be fitted to any character, or at least any character of a given class, such as a mariner or a merchant, a planter or a pickpocket. He did not care, at all events he did not labour, to individualize character. Crusoe, his most finished portrait, is still only the average representative of all shipwrecked mariners; his reflections and his struggles, embody the hopes, fears, and efforts, of all men left to maintain a solitary warfare with difficulties. So his Captain Jack, born a gentleman and bred a pickpocket, has nothing to separate him from other *enfants perdus* of the same class. But Richardson aspired to the creation rather of probable character than probable incident; and to this he applied the same system of accumulating minute traits of words, thoughts, and actions, and reiterating small touches, and minute lights and shadings, which Defoe had done to the creation of masses of coherent and plausible events. In the latter department, indeed, he is probably neither remarkable for success nor failure. Occasionally, and particularly in his *Sir Charles Grandison*, he outrages both patience and probability in no inconsiderable degree; and so little progress does the narrative make, that as Johnson remarked to Erskine, “Were you to read Richardson for the story, your impatience would be so fretted, you would go hang yourself.” But even in the most successful portion of his plots, there is no chance of our mistaking fiction for fact; the artist does not disappear behind his creations as in the case of Defoe. The very form, too, in which his novels are cast, that of a series of correspondence, however favourable to the display of traits of character, and minute dissection of sentiment, is

Romance.

almost in itself fatal to the vraisemblance of incident. The affairs of private life, we cannot help recollecting, are seldom managed to any great extent through the post-office, while in many cases it remains a mystery how such matters came to be committed to paper at all, and least of all under the circumstances in which they are supposed to be recorded by these persevering, and, in the existing state of the revenue laws, formidable correspondents.

There is in the mind of Richardson a very remarkable union of feminine tastes with masculine vigour. Early accustomed peculiarly to court the society of females; the depositary of their gossip, the confidant of their love secrets, the complete letter-writer of a little knot of young ladies when only thirteen years of age, the deference which he thus acquired for their tastes, and the insight he obtained into their habits of thinking, though probably springing, as Johnson believed, very much from his own vanity and love of praise, appear to have been of the utmost use to him in his novels, in which so much of the interest rests upon the female characters, and in the minute dissection and study of emotions and sentiments in which women are either the chief actors or sufferers. The traces of this influence appear constantly, and sometimes in excess, in the minute accuracy with which he dwells, in description, upon those little particulars of looks, and voice, and gesture, and turns of speech, which men in their correspondence generally overlook, but which women note with such care, and interpret with such sagacity; in the complacency with which he dwells on the details of robes and wedding-dresses, which are conceived in the spirit of a waiting-woman, and executed with the learning of a man-milliner, and which, as in the minute description given by Lovelace of *Clarissa's* dress at the time of her elopement, are occasionally introduced in the worst place.

The more favourable results of these tastes are exhibited in the wonderful familiarity he evinces with the feelings and sympathies of women; for though in his notions of perfection, either in manners or morals, we of another age often see cause to depart from Richardson's standard, we may trust implicitly to his accuracy when he is delineating the movements of passion in the female breast, the revolutions of feeling, or the struggle between feeling and delicacy. In his female portraits, even more than in his corresponding delineations of male character, we acknowledge the justice of the remark which Sir Walter Scott applies to his portraits generally, that "in his survey of the heart he left neither head, bay, nor inlet behind him, until he had traced its soundings, and laid it down in his chart, with all its minute sinuosities, its depths, and its shallows." This accuracy, indeed, constitutes at once his strength and his weakness; for not content with having surveyed the coast and taken its bearings, he still, from the very pride of discovery, insists on following the windings of the shore, and pointing out its landmarks, when those on board would have gladly seen him make his passage by the shortest course. It was the misfortune of Richardson that, like nervous men in company, or like painters who go on re-touching till the picture becomes loaded, he never knew when to have done, either with a character or a conversation. He was unskilful, as D'Israeli remarks, in the art of writing, and "could never lay his pen down while his inkhorn supplied it." Even as regards the description of sentiment or the creation of characteristic dialogue, the field in which Richardson was most at home, it is certain that he carried his system, probably as much from this inability to leave off as from choice, to extremes, particularly in his last novel, *Sir Charles Grandison*; and unless the reader selects that work on the system of the old lady mentioned by Sir Walter Scott, who chose it because she could sleep for half an hour at any time during its perusal, and still find the personages just where she left them, conversing in the cedar parlour, he will probably

Romance.

think there is more justice than D'Israeli seems willing to admit in the cold remark of D'Alembert, "*La nature est bonne à imiter, mais non pas jusqu'à l'ennui.*"

It is not often that with this feminine character of intellect, a masculine vigour in painting scenes of a passionate and terrible cast is found united; and yet Richardson has proved his mastery over the higher passions, not less than his minute study of sentiment and manners, in the conclusion of *Clarissa Harlowe*. To apply to him the epithet of the Shakspeare of prose fiction, which has been done by D'Israeli, is extravagant. A solitary creation of this kind, highly pathetic and morally impressive as it is, is but a narrow basis on which to rest the claims of the novelist to such a title. But the conception of the noble character of *Clarissa Harlowe*, set off by such a foil as is afforded by that of *Lovelace*, perhaps the most finished picture of the self-possessed and insinuating libertine ever drawn (and certainly as great an improvement on that of the *Lothario* from which it was drawn, as Rowe's hero had been on the vulgar rake of *Massinger*), and the closing scenes of that novel, are at all events sufficient to place Richardson among the great writers of fiction; among the few who have formed a striking and original conception, which they have wrought out with a corresponding felicity and power.

A strong contrast to the subtlety, the fine perception, and the power over the passions evinced by Richardson, is presented by his rival Fielding (1707-1754), who, with no command of the pathetic, and no taste for that minute analysis of sentiment and wire-drawing of description in which our English *Marivaux* indulges, has yet maintained a more general and permanent popularity, by a combination of qualities well suited for the purpose. His grasp of observation led him to select with unerring sagacity the leading traits of ordinary character, and to epitomize nature with skill, instead of transcribing her at full length. His field of delineation admits of such variety and contrast, that in fact it excludes none but the highest and most poetical elements, in which Fielding had neither power of observation or conception. His flow of animal spirits and healthy vivacity of manner, contrast strangely with the Dutch finishing of Richardson's pencilling, but are as well suited to the active, out-of-door scenes which Fielding loved to draw, in his pictures of imbroghios at ale-houses, and the stirring life of the road, as the painstaking inventories of Richardson were to his still-life interiors, and the drowsy monotony of the occupations of the inhabitants. To these he added, at least in his great work *Tom Jones*, the charm of a plot of unrivalled skill, in which the complex threads of interest are all brought to bear upon the catastrophe in a manner equally unexpected and simple, a grave humour, and power of quiet satire unmixed with caricature, in which he is equally superior to Richardson and Smollett. And with his other requisites he combined a knowledge of English life, both in its better features and its deformities, by which we mean, of the essential qualities of men, as modified at that time by the accidents of situation, education, and pursuits,—the result, perhaps, of a long, and not always reputable experience,—to which Richardson, surrounded by a circle of female gossips, and weaving out his materials in his quiet back-shop, purely from the stores of his imagination, can make but slender pretension.

Amelia, much as it was admired by Johnson, is greatly inferior to *Tom Jones*. If the tone of the latter be far from high, that of *Amelia* is creeping and vulgar in no ordinary degree. Booth has Jones' vices with an additional shade of meanness. Half the plot turns on the embarrassments of debt and contrivances to make both ends meet; and one or other of the characters is generally in a spunging-house. Such, too, is the infirmity of human nature, that we really find it difficult to preserve a sufficiently romantic respect

Fielding.

Romance. for the heroine, pretty and amiable as she is, when the saucypan is seldom out of her hand.

"Nec tantum veneris quantum studiosa culinae."

The finish is put to the whole by the accident which mars even the personal attractions of the heroine; for though the public were willing to regard Clarissa, after the outrage to her honour, with undiminished sympathy, it is certain they have not been equally indulgent to Amelia, after the misfortune of the broken nose.

We have already, however, in our biographical notice of Fielding, quoted so amply from Sir Walter Scott's critique upon his genius and works, that instead of pursuing an exhausted theme, we refer our readers to that article.

Smollett.

The name of Fielding always suggests that of his rival Smollett (1721-1774), though, as writers of fiction, they rather admit of being contrasted than compared. They have, in fact, very few, if any, points in common; agreeing only perhaps in a preference for the delineation of the comic, or the common, over the impassioned and poetical. They chose different departments in novel-writing, and they cultivated them by different means. As Fielding was the faithful and graphic painter of all the common features of character, so the extraordinary and the eccentric were the peculiar appanage of Smollett. He either did not feel sufficiently the charm of the natural in character, and its power of endless re-combination in the hands of a great artist, or he doubted his own powers, at least in comparison with Fielding, of extracting novelty from such simple materials. But the sphere of humorous exaggeration appeared to be open to him, without the awe of a predecessor or the dread of a rival; on that, therefore, he concentrated his powers of mind, neglecting in a great measure the other requisites of fiction; and undoubtedly with a success which leaves him, within the province which he was the first to occupy, and with the occupation of which he was content, still the undisputed sovereign. No one has ever yet equalled him in the observation, or where that does not serve his purpose, the creation, of oddities and exceptional characters which never did or could exist, but still with just enough of humanity about them to give us an interest in their eccentric movements; or in the invention of combinations of burlesque incidents, not always of the best odour, which his fertile fancy showers forth spontaneously as from a cornucopia; mistakes, rencontres, equivokes, whimsicalities of speech or action, all generally the best calculated to bring in high-raised and ludicrous relief the comic aberrations of the character represented, and to develop its latent madness; and never failing, at all events, to produce that result which Smollett seemed far more studious to attain than that of "purging the passions by pity or terror;" namely, the excitement of a broad-grin mirth, and "laughter holding both his sides." That the characters, where they have any decided features at all, are generally caricatures; for instance, that such commodores and lieutenants as Trunnion and Hatchway never floated even under the primitive flag of Benbow; that the absurdities of Pallet are painted an inch thick; that by no human possibility could such an accumulation of comic disasters have befallen the characters of the tale, may, and indeed must be granted, even by Smollett's warmest admirers. But if, following Smollett's own example, we throw nature mainly out of the question, and look to what seems to have been his real aim, the objection of want of verisimilitude, while it may retain its truth, seems to lose half its force, and, we may add, wholly its power of conviction. It is in vain to point out the extravagance of the scene where Jolter, in an agony of terror, on hearing the direction given to put on the dead lights in the storm off Calais, goes through the steps of a mathematical proposition with infinite fervour, instead of a prayer; or to criticise the manœuvres of Trunnion, tacking his way to

church on his wedding-day in consequence of a head wind; when the reader cannot see the force of the objection through tears of laughter. In that consummation which he chiefly aimed at, and in which he rarely fails, Smollett has gained his end;—*solvuntur risu tabulae*; the sense of the improbability of the conceptions is lost in the irrepressible merriment which they occasion.

Romance.

Humour, then, was the quality in which Smollett felt himself strongest; character, incident, the excitement of the feelings, were obviously with him minor considerations. There is no difficulty in discriminating his style of humour from that of Fielding. Fielding's is calmer, chaster, perhaps of a higher kind than Smollett's, but it certainly has not its breadth, force, and felicity. Smollett could hardly have created in its main features so gentle a humourist as Parson Adams, so he probably could have scarcely imagined a stroke of humour so delicate and appropriate to the character, as when the Parson offers to walk ten miles to fetch his sermon against Vanity, in order to convince his auditor of his total freedom from that vice. But neither, on the other hand, could Fielding have imagined the inimitable feast after the manner of the ancients, the apparition of Pipes to the Commodore, the terror of Pallet on learning the supposed conditions of his emancipation from the Bastille, or the ludicrous concatenation of mischances which beset the luckless inmates of the inn in Flanders "doing or suffering." Some scenes of this sort, in which Fielding enters into competition with Smollett, such as those at the inn at Upton, are among the least successful in his novels. The effort to raise the waters, the malice prepense in the preparation of the comic machinery, is too obvious; and after all, though he creates abundance of confusion, he raises but few smiles.

In another quality, though he has but rarely availed himself of his powers in this respect, Smollett far surpassed Fielding; we mean in his power of exciting the emotions of terror, or the sublime. From scenes of this kind, Fielding, knowing the prosaic turn of his own mind, and the limits of his invention, kept at a respectful distance; Smollett, who felt within himself the spirit of a poet, has occasionally ventured upon them, and with complete success. The robber scene in the old woman's hut in *Count Fathom*, though often imitated since, still remains one of the most impressive and agitating night-pieces of its kind; and the sublimity of the situation on ship-board, where Random sits chained to the poop during an engagement, covered with the blood and brains of the wounded, and screaming in delirium, has been often pointed out.

The morality of Smollett and Fielding is nearly on a par; with this difference, that the slight dash of generosity which is infused into the blackguardism of Tom Jones, while it renders him more natural, makes him at the same time more dangerous than the selfish and often ruffianly heroes of Smollett, whom we despise or dislike, even while laughing at the cruel frolics in which they indulge. The heroes of the latter are mere animals, good-natured or savage, as the fit strikes them; the heroines, with the exception perhaps of Aurelia Darnel in *Sir Lancelot Greaves*, the weakest of Smollett's works, have been justly described of objects rather of appetite than affection. In regard, indeed, to anything like purity of morals or gentlemanly feeling, the inferiority both of Smollett and Fielding to Richardson is obvious. Richardson sometimes mistook his means, but his aim was certainly always moral. On the contrary, both the theory and the practice of Fielding were latitudinarian; and Smollett, though in real life a man of pure morals, had a boundless toleration in fiction for certain vices; for most, indeed, which did not imply want of spirit, courage, or pecuniary generosity.

In the unity of conception and coherence of incident which the plot of the novel, though more pliable than that

Romance.

of the drama demands, Fielding, in his two principal works (for *Joseph Andrews* was merely a parody on Richardson's *Pamela*) has a great advantage over Smollett, whose plots indeed in general scarcely deserve the name, being simply a series of strange accidents, odd rencontres, tricks, and frolics, making little or no progress towards the only catastrophe which Smollett seems to have in view, namely, the marriage of his hero. In his *Roderick Random*, *Peregrine Pickle*, and *Count Fathom*, Smollett adopted the easy in-artificial plan of *Gil Blas*, in which we are carried through a succession of scenes where the personages are constantly changing, and those who take part in the close of the story, are quite different from those by whom we are surrounded at its commencement. Fielding, on the contrary, both in his *Tom Jones* and *Amelia*, is singularly attentive to regularity of plan, and to the dexterous evolution and winding-up of his plot, which he regarded as of vital importance. From the very commencement we perceive that he keeps his conclusion clearly in view, "and sees as from a tower the end of all." From this attention to symmetry, and tendency of all the incidents towards the catastrophe, his best work has been not inaptly termed a prose epic; it is at all events a happy accommodation of the principles of the epic, so far as they could be rendered applicable, to the manner of the novel. One exception ought perhaps to be made from this remark on the imperfection of Smollett's plots, in favour of that of *Humphrey Clinker*, in which the plot, though not of much art, is naturally evolved, and a quiet little family romance is gracefully combined with the usual gallery of oddities which Smollett never fails to lay before us. In all respects, this is the most pleasing of his performances. While Lesmahago may rank with the very best of his extravagances, there is more of character and less of caricature in the testy yet kind-hearted Matthew Bramble, "frosty but kindly," than in any personage he has painted; and though the humour, as usual, is dashed with filth, without a *souppçon*, of which indeed Smollett seems always to have thought it wanted pungency, the tale is entirely free from that indecency which deforms both *Roderick Random* and *Peregrine Pickle*. We rather think, too, that Smollett had the merit of originating in this novel that species of the humorous which arises from bad spelling, and which Sheridan afterwards applied to mistakes of words in his *Mrs Malaprop*; a humble kind of humour no doubt in itself, yet capable, as Smollett has proved, of powerfully aiding the ludicrous effect.

Sterne.

Equal genius, though far more deformed by affectation, is visible in Sterne (1713-1768), the first two volumes of whose *Tristram Shandy* appeared in 1759. If a regular progress of incidents towards a catastrophe were an essential requisite in a novel, it would be difficult to bring the works of Sterne within the protection of that definition. Story he has none to tell; at all events, he tells it not. But, "what is a plot good for," says Bayes, "except to bring in good things," and Sterne adopted the theory of the dramatist in its full license. At the conclusion of the eighth volume *Tristram* is not emancipated from the nursery, and had Sterne lived to fulfil his threat of carrying on his work, by the aid of a vegetable diet, through as many more, the *Tristrapædia*, we fear, would still have made no material progress. Sterne's singular work owes its interest, as every one knows, not to the narrative, which is broken and interrupted by cross currents of the most wayward and whimsical description, far exceeding all the fair license of digression, but to his power of seizing on and bringing forward into distinct consciousness, as Coleridge says, some of those points on which every man is a humourist, and to the masterly manner in which he has brought out the characteristics of two beings of the most opposite natures, the elder Shandy and Toby, and sur-

Romance.

rounded them with a group of followers sketched with equal life and individuality: in the Corporal, the obstetric Doctor Slop; Yoick, the lively and careless parson; the widow Wadman and Susannah.

The clue which Sterne chiefly follows through the mazes of character is humour;—humour of a very high and peculiar kind, perfectly original, at least in English. For that species of riotous humour arising from comic peculiarities of person and combinations of ludicrous mischances Sterne has little taste; though the admirably-painted scene, where Obadiah on the cart-horse, careering round the corner like a comet, oversets Dr Slop in a whirlpool of mud;—and the cross bills filed by the Doctor and Susannah against each other in applying the cataplasm, show that if he had considered this the highest walk of humour, he might have revelled in it as easily as Smollett himself. But like Fielding, he preferred the humour which arises from bunging out by light and happy touches, and as if unconsciously, the secrets of character; only with this difference in his favour, that with Sterne the humour is steeped in sensibility. Flowing, as it does, as much from the heart as the head, it speaks also to the affections; calm smiles ripple over the countenance as we read, but tears are in the next degree. Thus, in Sterne, humour and feeling heighten and set off each other; the pathetic rises in gentle relief out of the background of the comic, and sinks gracefully and imperceptibly back into it again. It is this, for instance, which gives so irresistible a charm to the story of *Le Fevre*, and the Corporal's account in the kitchen of the death of *Tristram's* elder brother, enforced by the eloquent stroke of dropping the hat, as if a lump of clay had been kneaded into the crown of it. There is nothing sneering, nothing unkindly, nothing that revolts the better feelings in his playful irony. *Circum præcordia ludit*. That of Swift and Voltaire is blighting like an east wind; the sympathies of the heart close themselves up against it; but beneath the genial and balmy humour of Cervantes and Sterne they relax and blow like flowers expanding beneath the west wind in spring.

The two great defects of Sterne, as noticed by Sir Walter Scott, are his affectation and his indefensible indecency. His affectation is the more to be regretted, because his manner in its happiest moods is the very perfection of a lively, spirited, spoken style—idiomatic, imaginative, pliant, and varied. "Writing, when properly managed," he himself observes, "is but a different name for conversation." Unfortunately he did not always conform his practice to his precept. He is sometimes *fade* in his sentimentality, and aiming after a sort of false sublime in his imagery. Some portions of the story of *Maria* are examples of the first; the well-known personification of the recording angel in the close of *Le Fevre* is an instance of the second. Still more unworthy of Sterne are those quackeries of the black page and the white one, the sudden transitions and affected openings of the chapters, with other harlequinades of authorship, which are carried to excess in *Tristram Shandy*.

The indecency of Sterne is more obtrusive and indefensible than that of either Fielding or Smollett; whose highly-coloured scenes seem to be the result of an unchecked imagination, running on heedless whether its course lie through purity or filth. Sterne, on the other hand, goes coldly and deliberately in search of impurity; seeks for it in books, refines upon it, mixes it up with his reflections, and is continually insinuating some equivocal or *double entendre* into scenes where we can ill bear with such adulteration.

Richardson, Fielding, Smollett, and Sterne are the four Goldsmiths, great novelists of this period (the reign of George II.) which was pre-eminently the age of novel-writing in England. For though we should indeed be sorry to undervalue the merits of Goldsmith, or the charm of his *Vicar of*

Romance. *Wakefield*, we cannot quite rank the powers displayed in that delightful little tale, which appeared in 1763, so highly as the varied invention displayed by the writers we have named, upon the broader canvas which they selected. To use his own words, it has many faults, and a hundred things might plausibly be said to prove them beauties. Fortunately they lie more in the minor parts than in the essentials of the tale. In fact, the improbability of the plot is only equalled by the wonderful truth, nature, and keeping of the principal character, for the "līmæ labor" which, in this instance, Goldsmith willingly bestowed upon his style, and on the creation and apposition of traits of character he scrupled to waste upon the selection of his incidents. The real interest lies in the development of the character of the amiable Vicar, so rich in heavenly, so poor in earthly wisdom;—possessing little for himself, yet ready to make that little less, whenever misery appeals to his compassion;—with enough of literary vanity about him to show that he shares the weaknesses of our nature,—ready to be imposed upon by cosmogonies and fictitious bills of exchange, and yet commanding, by the simple and serene dignity of goodness, the respect even of the profligate, and making "those who came to mock remain to pray." Doubtless, the probability and look of life which a character drawn with such quiet strokes of the pencil, and with such sobriety of colouring, possesses, is in some measure owing to the fact, that not a few of the incidents of which Goldsmith has availed himself are drawn from circumstances in his personal history, such as the mistake of setting out to teach the French English, without recollecting that it was a necessary preliminary for the tutor to acquire a little French himself; but the skill which can make such trifles in real life subservient to the purposes of real fiction is scarcely less worthy of praise than would have been their original invention. Perhaps there is no better proof of the broad and general truth of delineation which a novel possesses than our being in the habit of resorting to it in conversation for cases in point and comic illustrations of our opinions. In this respect the *Vicar of Wakefield* forms a storehouse of allusion. How naturally does any ridiculous investment in Mexican mines or Spanish stock recall to our recollection Moses' bargain for the gross of green spectacles? Who is there that has not been reminded of the aristocratic Miss Skeggs turning out to be no better than she should be, notwithstanding her intimacy with the Duchess and her taste for Shakspeare and the musical glasses, by some case of the kind within our own experience where, reversing the denouement of the Double Arrangement, the Knight Templar of the company has sunk into the waiter? And, for our own part, we must admit that we have never been able to treat with due gravity any allusion to the learned speculations of Manetho, Berossus, or Sanchoniathon, from their indissoluble connection in our minds with the more finished cosmogony of Jenkinson.

In one respect Goldsmith rises conspicuously superior to his brethren; he has no passages, which, dying, he need have wished to blot, and his characters and his incidents are all calculated to call forth only the better feelings of our nature. *Virginibus puerisque* might have been his appropriate and uncontested motto.

The great novelists to whom we have alluded, and particularly Fielding, Smollett, and Sterne, had of course many imitators. But the minuteness of Richardson was found to be intolerable in any hands but his own, and his manner, in this country at least, though not in France and Germany, was soon abandoned. Amongst the numerous imitations of Fielding's manner, most of which are now forgotten, the *Henry of Cumberland* (1752–1811), is probably the most respectable. Cumberland possessed that degree of talent which enabled him, both in dramatic com-

position, and in the novel, to produce performances which are read with pleasure, though they seldom rouse our interest, and never impress us with the idea of a creative genius.

The imitations of Smollett's manner were not numerous, Charles and, with one exception, totally without merit. We allude to *The Adventures of a Guinea*, by Charles Johnstone, which appeared in 1761, in which a series of scenes and personages in different walks of life are brought before us through the somewhat inartificial mode of making a coin, which shifts through the hands of successive proprietors, the historian of their follies and their vices; a contrivance very inferior indeed to the ingenious machinery by which Asmodeus unveils to Don Cleofas the secrets of Spanish life. In *The Adventures of a Guinea*, the author seems to have had before him both Le Sage and Smollett as models; but in the result he exhibits little of the gay good-humoured touch of the Frenchman, and nothing of the cordial merriment of the Scot.

Sterne is perhaps the only one of our great novelists who has found an imitator of genius, in Mackenzie (1745–1831); for although in his *Man of the World*, and *Julia de Roubigne* Mackenzie has deviated from the manner of Sterne, and formed a composite manner, in which the characteristics of several writers are blended with his own, yet there can be little doubt that the spirit of Sterne, in his pathetic passages, in a great measure inspired *The Man of Feeling*, and prompted that "illustration of the richer and finer sensibilities of the human breast," which Sir Walter Scott points out as the "key-note" on which he formed his tales of fictitious woe. In some obvious respects, no doubt, Mackenzie improved upon his model; as in rejecting the licentiousness of Sterne's wit, retrenching his episodical digressions, his numerous impertinences, and intrusive buffoonery, and keeping the strain of feeling which he wishes to create more unbroken; but as writers of genius, there surely can be no comparison between them. Mackenzie has none of those charming touches which hover with such a fine ambiguity between the pathetic and the humorous,—like Toby's opening the window and liberating the fly which had been buzzing about him all day,—and which operate like spells upon the heart.

The *Rasselas* of Dr Johnson (1709–1783), though it wears the form of a tale, has but slender pretensions to be included amongst the class of novels, for it has neither progressive incident nor character. It is a series of dialogues and moral reflections, very solemnly and beautifully written, tinged with that tone of mournfulness and despondency so likely to be the prevailing feeling of his mind in the composition of a work intended to defray the expenses of a mother's funeral. *Rasselas* is, in fact, the *Vanity of Human Wishes* in prose; and its incidents, if such they may be called, have even less pretensions to connected interest than those of *Candide*, to which it may be regarded as a moral and philosophical antithesis.

Judging, indeed, from *Rasselas*, and from the other writings of Johnson, it may be safely assumed that his success as a novelist would not have been much greater than as a dramatic poet. He has nowhere shown the least power of creation, by stepping out of himself, and putting on by the force of imagination the nature of others. Through the disguise of all the successive characters which he is obliged to assume in the *Rambler*, the sturdy, controversial, and somewhat pompous moralist stands confessed; and whether he writes as a fine lady, a fop, a blood, or an elderly gentleman, still, like Puck, "we know the man by the Athenian garments he hath on." Independently of this, his views of life would certainly have been untrue, inasmuch as they were one-sided. Far from being disposed "to make the happiness he could not find," the tendency of his mind,—in consequence, perhaps, of a con-

Romance.

stitutional melancholy,—was rather to unmake and neutralize the elements of comfort by which human life in the average is surrounded. Had he devoted himself in earnest to fictitious composition, he would have lent his eloquence and power of forcible statement to shape the world of romance according to the gloomy fashion which the reality presented to his eye; and in an inky coat, indeed, or a drab-coloured suit at best, very unlike the peach-blossom of his friend Goldsmith, he would in all probability have arrayed it.

Horace
Walpole.

About 1769 we witness the revival, though in a new shape, of the old taste for romance. The delineation of life as it actually existed was found to afford too little scope to minds who aspired after the imaginative and poetical, and who could not see why natural delineation of character and manners might not be combined with striking events, and with the picture of the higher passions; why, as Walpole expresses it, in his preface to the *Castle of Otranto* "the fancy might not be left to expatiate through the boundless realms of invention, and thence to create more interesting situations, while the mortal agents in the drama still conducted themselves according to the rules of probability." In the first shape, however, in which romance re-appeared after this temporary slumber, the delineation of character occupied, it must be owned, but a very subordinate place. A little more attention was given to verisimilitude of manners, and much was done to abbreviate the tedious style of the old prose romance, and to throw life and movement into the narrative by dialogue, and by the omission of unimportant incidents not bearing on the catastrophe; but the main efforts of our first modern romance writers were directed chiefly to the excitement of that feeling of love of the marvellous which exists more or less in every human breast. They chose for their favourite themes the varieties of the supernatural.

"Somnia, terrores magicos, miracula, sagas,
Nocturnos lemmures, portentaque."

We admit that the author of the *Castle of Otranto* did not trust exclusively to such materials of interest. But granting that the general outlines of "his feudal tyrant, his distressed damsels, his resigned yet dignified churchman," are sufficiently correct, we are at a loss to perceive in any of his characters that individuality which gives to such pictures their chief value. To us they seem light, sketchy, and somewhat vague, although we think it quite possible that the effect produced by greater truth and distinctness of feature in the mortal agents of the piece might not have harmonized with the extravagant demands upon the imagination which the author makes by his supernatural machinery. We agree with Sir Walter Scott in thinking Walpole acted with judgment in leaving his machinery without those attempts at explanation introduced by Mrs Radcliffe, always inadequate, and even throwing an air of ridicule over the mysteries of the piece upon a second perusal. But we cannot concur with him in his toleration of the extent to which Walpole has carried the marvels and improbabilities of his romance. The apparition of Alfonso in the moonlight, dilated to a gigantic form, is impressive, and in certain moods of the mind even the skeleton ghost in the hermit's cowl may have its terrors. But Clara Reeve was certainly right in the protest which she enters in her preface against the introduction of such machinery as that of a sword so large as to require a hundred men to lift it; a helmet that, by its own weight, forces a passage through a court-yard into an arched vault, and crushes a boy to death; or a picture walking out of its frame. The effect of such violent instruments of terror is suicidal; they destroy the very feeling they were intended to create, and give to the romance the air of a nursery tale. Indeed, were it not for the singular charm

of the style, which, like all Walpole's compositions, is of the purest and most idiomatic English, and terse and condensed in a very high degree, we feel persuaded that the *Castle of Otranto*, although the first specimen of the modern romance, would at the present day find few admirers.

In some respects, then, we think the *Old English Baron* Clara of Clara Reeve was an improvement on the *Castle of Otranto*. For there the marvellous was brought within some limit of proportion; "the extravagant and erring spirit hied to his confine;" and consequently, so far as regarded the creation of an impression of superstitious terror, or giving an air of probability and keeping to her narrative, we must admit that her ghost of Lord Lovel, who is always exhibited under the obscurity of a dim religious light, did, in our youthful days, produce upon us a certain species of awe. In other respects we rather fear the apprehension which is expressed in her preface,—namely, that in avoiding the defects of Walpole the spirit of his wild composition might evaporate,—was not altogether without foundation. The style of the narrative in her hands became heavy, often dry and vulgar, like the ancient chronicle she professes to follow; her dialogue is peculiarly flat and cumbrous, and the plot deformed, and rendered tedious by trifling incidents which now appear to us needlessly homely; and yet the strong interest with which, as we can state from experience, this romance is perused at an early age, is a proof that in the cardinal point of exciting curiosity and a feeling of mysterious interest, the ruder narrative of Clara Reeve effects, in a great measure, what all the liveliness of style, the deeper antiquarian reading, and more creative fancy of Walpole failed to attain.

But this species of romance-writing was probably carried to its perfection by Mrs Radcliffe (1764–1823), who, in her own walk of fiction, has never been excelled, though opinions may differ as to the comparative rank which she holds among writers of fiction, and also as to the soundness of that principle of composition which led her systematically to unravel her own spells, and to attempt an explanation by natural means of effects which we had at first been encouraged to refer to the agency of supernatural causes. Indeed, we might rather say that, in regard to this last point, there is no room for doubt, and that this system of explanations is exposed to every possible objection;—as totally inadequate in general to account for the effects ascribed to it,—as running counter to the whole tone of sentiment created up to the period of explanation,—as disappointing the pride of the reader, who feels offended at the thought that he has expended so much anxiety and terror on a mere "painted devil," and a succession of mockeries; and is consequently annoyed at this commonplace anti-climax after his nerves have been tuned for grand wonders, instead of the discovery of paltry images of wax-work. Indeed, it is one of the strongest proofs of the redeeming genius which Mrs Radcliffe has thrown into her tales, constructed as they are upon so unsatisfactory a plan, that they bear a second perusal at all; or that, having discovered in one or two cases the inadequate and puerile nature of what appeared at first so appalling and formidable, we still feel eager for the solution of the remaining mysteries, and can hardly persuade ourselves but that something strange and fearful does lurk, after all, within her deserted chambers and beneath her faded tapestry.

Yet it is wonderful what a magical power she exercises within the field to which she restricts herself. No one ever seems to have understood better the art of preparation, the attunement of the mind to the key of the supernatural, by a long train of half-heard sounds, and glimpses of sights, which the fancy, amidst night and silence, works up for itself into images of things which it fears to contemplate,—

Romance.

"Like one that on a lonesome road
Doth walk in fear and dread;
And having once looked round, walks on,
And turns no more his head,—
Because he knows a frightful fiend
Doth close behind him tread."

And perhaps the strongest proof of her judgment is to be found in the economy and reserve with which she employs the talisman of terror. In her hands slight circumstances and half-hints are made to produce all the effect of fearful witcheries or scenes of bloodshed and horror. The clang of a distant door, a footfall or a track of blood upon a staircase, a strain of music floating over a forest, a figure pacing a platform in silence, some wandering voice following us, "with airy tongue that syllables men's names," through the passages of a decaying chateau, the heaving of the tapestry of a bed in some deserted chamber, nay, at last a very rat behind the arras, become invested with a mysterious dignity, and work upon the imagination like spells.

Mrs Radcliffe may claim the merit of being the first to introduce landscape-painting into her romances as a component part of the interest of the piece. The frequency of her pictures of external scenery, and their want of distinctness and local truth, have indeed been blamed by many who would willingly, on Puff's principle, have abridged her descriptions of the rising sun, and dispensed with a great deal about gilding the eastern hemisphere. But it is certain that these descriptions, though occasionally tedious, and sometimes too obviously brought forward upon a principle of melo-dramatic contrast, have a powerful effect in heightening the impression communicated by the incidents or the sentiments. Set off against the calm beauty of a summer evening, or the magnificent gloom of a thunder-storm, her pastoral or banditti groups stand out with double effect; while to the charge of vagueness of description it may be answered, that Mrs Radcliffe is by no means vague where distinctness of imagery is, or ought to be, her object; as any one may satisfy himself who recalls to his recollection her description of the lonely house by the Mediterranean, with the scudding clouds, the screaming sea-birds, and the stormy sea, the scene selected for the murder of Ellena; or another picture, in the best manner of Salvator, of the first glimpse of the castle of Udolpho rising over a mountain pass, with the slant sunbeam lighting up its ancient weather-beaten towers. Indeed, the whole description of that Apennine fastness, both without and within, is in the best style, not of literal indeed, but of imaginative painting,—“Fate sits on those dark battlements and frowns:” the very intricacy of its internal architecture, and its endless passages,—a mighty maze, and we fear without a plan,—only serve to deepen the impression of imprisonment and bewilderment and gloom.

To be fully enjoyed, the romances of Mrs Radcliffe must be perused in youth. In after age they appear too uniformly visionary, and the straight-laced stiffness of her heroines, who never manifest the least warmth except in poetry, “female punctuation not permitting them to do more,” as Mrs Malaprop observes, suggests the recollection of the pruderies of the pastoral and heroic romance. But when these tales are read in youth, and only remembered in manhood in their better portions, they leave upon the memory a pleasing impression of a varied pageant of gloomy castles and caves, moon-illuminated streets and palaces, “dance and Provençal song and sun-burnt mirth,” ærial music floating over haunted forests, or the chant of monk or nun borne to the ear over the waters of some Italian lake, amidst the stillness and the shadows of evening.

We have devoted a larger space to Mrs Radcliffe than some may think justly due to the rank in fiction which she occupies, but we have done so,—first, because we think justice has seldom been done to the real genius which she

Romance.

threw into the style of fiction she chose to adopt, whatever may be its precise order of precedence in the calendar of fiction; and secondly, because, although that style became more universally popular and more generally imitated than any which had preceded it, she herself, with two exceptions only, which we shall notice, remains the solitary writer of genius by which it has been adorned. The truth is, that the sarcasms which have been directed against the puerile horrors of Mrs Radcliffe ought justly to have been confined to the extravagances of her successors, who imitated her manner without either her imagination or her judgment, and conceived that the surest means of producing effect consisted in pressing the springs of the terrible as far as they would go.

The two exceptions from the general dulness and commonplace of the imitators of Mrs Radcliffe are the *Monk* of M. G. Lewis, which appeared in 1796, and *The Montorio* of Maturin, published in 1807, and among the last romances written on that now antiquated plan. Much injustice, we believe, was done to Lewis at the time. A single unfortunate remark of an irreligious tendency, and some descriptions of undue warmth, pardonable in a youth of twenty, and retrenched in the second edition, gave a blow to the popularity of this romance from which it never recovered. And yet the traces of considerable genius are visible both in its plan and in the execution of several of its powerful scenes. The mere hint of the story—that is to say, the general idea of the gradual corruption of a proud, and enthusiastic, and self-relying nature,—was taken, as Lewis acknowledged, from that of the Santon Baisisa in the *Guardian*; the incident of the escape of the baroness from the banditti was an expansion, executed with much skill, of the scene in the hut in *Count Fathom*; for the story of the bleeding nun he was indebted to a German legend; while he has borrowed several hints for his wandering Jew from the incomprehensible Armenian of Schiller. But to these hackneyed materials he has given a force and look of novelty that are surprising: the escape; the conjuration scene, where the Jew, withdrawing the black ribbon, unveils the burning cross on his forehead; the procession of St Clare by torch-light, where the abbess is torn to pieces,—once read, are not easily forgotten. Lewis also avoided Mrs Radcliffe's error; his ghosts are real and his devil genuine; though, as is not uncommon, we believe, in practice, he takes the form of a woman, instead of appearing, as Defoe has it, “in all his formalities and frightfuls.”

The *Montorio* of Maturin was also a boyish production, which the writer affected at a more advanced period of life to despise. Yet it appears to us to exhibit more genius, mingled, no doubt, with a deep vein of extravagance and false taste, than his more elaborate attempts to picture real manners and passions in his *Woman*. There was originality even in the conception, hideous as it was, of the hero employing against the brother, who had deceived him, the agency of that brother's own sons, whom he persuades to parricide by working on their visionary fears, and by the doctrines of fatalism; and then, when the deed is done, discovering that the victims whom he had reasoned and persecuted into crime were his own children. And though Maturin's machinery in no respect differs from that of his brethren, though he labours to explain away in the close all that had appeared supernatural in the beginning, and of course with total want of success, yet the impression left on the mind by the perusal of the work, in the three thickest volumes we believe that modern romance has to boast of, though gloomy and unsatisfactory, is certainly that of an inventive genius in the author. Such was the effect it produced on Sir Walter Scott, who was the first to direct attention to it by a criticism in the *Quarterly Review* for 1810: “We have strolled,” says he in a lively introduction, “through a variety of castles, each of which was re-

Romance.

gularly called Il Castello; met with many captains of condottieri; heard various ejaculations of Santa Maria and Diabolo; read, by a decaying lamp, and in a tapestried chamber, dozens of legends as stupid as the main history; examined such suites of deserted apartments as might set up a reasonable barrack, and saw as many glimmering lights as would make a respectable illumination. Amidst these flat imitations of the *Castle of Udolpho*, we lighted unexpectedly upon the work which is the subject of the present article, and in defiance of the very bad taste in which it is composed, we found ourselves unusually involved in the perusal, and at times impressed with no common degree of respect for the powers of the author."

Moore.

Of the *Zeluco* of Dr Moore, which appeared about 1785, we have already spoken in our biographical article. (See MOORE, *Dr John*.)

The influence of such works as Goethe's *Sorrows of Werther*, written seemingly with a view of reversing Pope's maxim, and proving that whatever is wrong, becomes very obvious in our literature of fiction towards the close of the eighteenth century. For in truth such speculations, embodied in an imaginative form, were found highly congenial to that spirit of restlessness and discontent with political institutions which was everywhere abroad, perplexing nations with fear of change, and leading men of genius to dress up moral paradoxes in the shape of narrative, and to employ their eloquence in attacking those principles of society which tend to make men happy, or which keep them so. This tendency appears sufficiently obvious in the novels of Bage, a sceptic in religion, and a latitudinarian in morals, whose crude theories, we think, might have been allowed to repose in that oblivion to which they had been consigned, without being revived in such a work as the *Novelist's Library*. Their introduction at all into a work intended to embody only the classical works of fiction, seems unaccountable; nor is the singularity diminished by the fact, that his best work, *Hermesprong, or Man as he is not*, is omitted, while three of inferior merit are re-published.

Robert Bage.

Godwin.

But the social and political theories of the time found an abler exponent in Godwin, whose first work, *Caleb Williams*, appeared in 1794, in which, throwing aside the stimulus of the marvellous, he has trusted the effect of his tale entirely to a picture of the workings of the mind on two beings of very opposite natures, who are driven, by a species of fatal instinct, into the relative positions of persecutor and victim. The doctrines of the *Political Justice* furnished avowedly the primary source of the inspiration of *Caleb Williams*, intended, to use the words of the preface, "to furnish a general review of the modes of domestic and unrecorded despotism, by which man becomes the destroyer of man; that is to say, to show that, under the maladministration of English law, liable to be perverted by influence and wealth, the chances are all in favour of the escape of the real criminal and the conviction of the innocent,—a proposition notoriously untrue, and which is not even advocated with much art or plausibility in the series of persecutions to which Williams is exposed. Fortunately, however, for the real merit and permanent popularity of this singular work, the political design soon merges in a higher and more legitimate interest. The genius of the author kindles as he proceeds, and out of a hard and republican background brings forth the bright and chivalrous vision of the aristocratic Falkland, a being of a loving, noble nature, the victim of false honour and morbid refinement of feeling. Few scenes in romance exceed in breathless and entrancing interest the description of the progress of suspicion in the mind of Williams, till he extorts from his master the fatal secret on which hangs the whole of his future fate; the escape from prison in the grey dawn of a drizzling morning; and the last interview between Williams and his dying persecutor, sitting, corpse-like, to hear his secret dis-

closed to the world, and to suffer the agony of knowing that life and reputation are about to leave him together.

Romance.

In none of his other works did Godwin evince the same grandeur of conception, and in none of his subsequent personations, except Bethlehem Gabor, did he exhibit that power of presenting demoniacal characters, such as Tyrrell and Gines, in a light which renders them, unnatural as they are, actual objects of terror, like a serpent in the path. The tone of his next novel, *St Leon*, is altogether more subdued than that of *Caleb Williams*. It has a mournful eloquence in harmony with the picture of desolation which it presents. Here, too, the author has imperfectly succeeded in working out the design which he announces he had in view,—namely, that of proving that the happiness of mankind would not have been augmented by the gifts of immortal youth and inexhaustible riches; for, in order to illustrate his position, Godwin is under the necessity of laying the scene in a remote age, and making the persecutions of St Leon arise from feelings of superstitious credulity, which we cannot help recollecting that the progress of intelligence has since exploded. The senior wrangler, who asked what *Paradise Lost* proved, would certainly therefore have been dissatisfied with Godwin's demonstration; but as the vehicle of a series of most touching and impressive scenes, his plot is far from deficient in interest, nor, granting its premises, in probability. None of his other tales have been popular.

No writer has come so near the manner of Godwin as Brown.

Charles Brockden Brown, an American novelist, an imitator of the English author, but in a free and noble spirit of imitation. He certainly had not Godwin's power of mental analysis, and not much of that pathetic tenderness which, contrasted with the general sternness of his tone, slows like a rainbow against a troubled sky. He was altogether more prosaic; dealing, indeed, rather with the material than the moral sublime; producing his strong effects by scenes of sickness, danger, death, or the explosions of insanity; and often making his characters mere *phantasmata*, which interest us only as the means by which a series of agitating incidents are brought into connection. But he had a good deal of the same eloquence, and the same dark and mysterious power of imagination; a certain intensity of portraiture, whether of mental emotion or things external; great skill in working up a chain of singular events that keep curiosity and suspense upon the stretch, or impress us with a sense of danger and anxiety, and of which he loves to furnish an explanation from those phenomena in our nature which are little understood, such as somnambulism, trances, spontaneous combustion, or ventriloquism. In these respects *Wieland*, *Ormond*, *Edgar Huntly*, and *Arthur Mervyn* have all nearly the same character, nor do they differ materially in point of merit. Brown has singular power in the delineation of solitude of all kinds, whether the silence of lonely forests, broken only by the howl of panthers, or of deserted mansions dropping to decay. There is one picture of this kind in *Arthur Mervyn*, of an empty house, evacuated during the yellow fever in Philadelphia, silent and dark in the day-time, with the sunshine streaming in through the closed doors and shutters, and faintly discovering that everything remained undisturbed since its desertion, which produces a strong feeling of awe, and oppresses the spirits with unaccountable sadness.

No other novelist of any ability can be said to have adopted the manner of Godwin with success, except his accomplished daughter, the authoress of *Frankenstein*, a production of much originality in its conception, though the execution of the work is unequal, and the whole portion which relates to the self-education of the monster, who is the creation of the new Prometheus, almost ludicrously improbable.

Mrs Shelley.

Several female novelists, towards the close of the eighteenth century, deserve notice, whose tales, though now little read, have the merit either of pathetic or humorous

Romance. delineation. In the first of these classes are Mrs Inchbald and Charlotte Smith; in the latter Madame D'Arblay, or, to use the name by which she was best known, Miss Burney.

Mrs Inchbald. The fame of Mrs Inchbald rests upon her *Simple Story*. The title perhaps is but of doubtful application to a novel which is really complicated with strong and varied passions, which turns on the fate and fortunes of persons placed in very peculiar relations to each other, and, like Shakspeare's *Winter's Tale*, unites two distinct stories relating to different personages, between the action of which "time has slid o'er sixteen years." It is a proof of considerable merit in the novel, that so hazardous an experiment as that of transferring our sympathies to actors in a great measure new to the scene, has not been unsuccessful; that the interest is, notwithstanding, kept up, partly by the real pathos of some of the scenes, and partly by the natural traits of passion in others. Her second novel, entitled *Nature and Art*, has been generally and justly reckoned much inferior to the *Simple Story*.

Charlotte Smith. Charlotte Smith (1749-1806), though her novels are extremely defective in plot, betraying marks of haste, and tinged with a melancholy easily to be accounted for from the depressing circumstances under which they were generally composed, cannot be confounded with the ordinary day-labourers for the circulating library, "who turn a Persian tale for half-a-crown." Sir Walter Scott, in one of those kindly notices by which he delighted to cheer the heart of struggling genius, or to do justice to the memory of talents which time was consigning somewhat too rapidly to oblivion, has given her credit for great powers of satire mixed with pathos, and characters sketched with "firmness of pencil and liveliness of colouring." The satire indeed seems to have been pretty indiscriminate, since it extends to her own husband, whose pecuniary improvidence and sanguine temperament are glanced at in the character of the projector who hoped to make a fortune by manuring his estate with old wigs. But apart from satire, the *Old Manor House*, the only one of her novels with which we are acquainted, is really entitled to the character of an interesting and well-written tale. We have a lively recollection of the *Manor House* itself, its neighbourhood, its sea-side scenes, the strange domineering lady of the manor, Mrs Rayland, whom Sir Walter Scott describes as a sort of Queen Elizabeth in private life, and the natural interest which she has succeeded in giving to the love story which is going on within the ancient walls.

Miss Burney (Madame D'Arblay). The popularity once enjoyed by the novels of Miss Burney appears now to have been somewhat overrated; at least we are at a loss to discover anything in her first work, *Evelina*, except the extreme youth of the writer, then only eighteen, to account for that burst of approbation with which it appears to have been received in 1778 by such men as Burke, Reynolds, and Johnson. She wrote no doubt with spightfulness, with some humour of a broad and superficial kind, and undoubtedly possessed considerable talent in drawing bores and personages of low manners or odd habits from vulgar middle life; in imagining scenes of awkward mistakes in society, and exaggerating the teasing distresses thence arising to her heroines and other personages of more refined manners or higher pretensions. Indeed, to mimicry she appears, from her father's account, to have had a strong leaning from her childhood; but when she rises from mere manners and habits to paint feelings, we see little but indecision on the one hand, or exaggeration on the other. Within the field where she excels too she is much of a mannerist; the same characters under other names, the same incidents under a thin disguise, reappear in *Evelina*, *Cecilia*, and *Camilla*. Even the graces of style which she had shown in her earlier works in a great measure forsook her in her last novel, the *Wanderer*;

a tissue of improbable distresses and silly refinements of sensibility, conveyed in language which is neither good English nor good sense.

The *Canterbury Tales* deserve notice on account of the interesting and highly original story of "Kruitzner," or the "German's Tale," by Harriet Lee, on which Lord Byron founded his *Werner*. The tales contributed to the work by her sister Sophia, such as the "Two Emilys" and the "Clergyman's Tale," though less striking, are written with genuine feeling and tenderness.

It may be observed, however, in those female novelists to whom we have last adverted that, though the marvellous is thrown aside, and the characters are taken from common life, the sentiments and tone of feeling are yet decidedly strained beyond the natural pitch. The characters display a degree of romantic affection and a prodigal expenditure of sensibility for which the cares and distractions of real life, we fear, afford but little leisure. It remained for Miss Austin (1775-1817) to show what a charm might be imparted to truthful pictures of life, as we really see it around us in the quiet monotony of domestic arrangements, with its interchanges of poetry and prose, business and strong feeling, and dialogues at balls and parties alternating with the secret griefs of the heart; just such a picture, in short, as Asmodeus would present, could he remove the roof of many an English home, and place us beside the hearths of the Knightleys, Bennets, Woodhouses, and Bertrams by whom they are inhabited. No species of novel-writing exposes itself to a severer trial, since it not only resigns all Bayes' pretensions "to elevate the imagination and bring you off in some extraordinary way," but by professing to give us pictures of our ordinary acquaintances, in their common garb, places its productions within that range of criticism where all are equally judges, and where Crispin is entitled to dictate to Apelles. And yet with such fine perception and perfect truth of keeping has Miss Austin performed her task, that we never miss in her novels the excitement of uncommon events, and rarely feel her simple annals of English life to be tedious or unworthy of the dignity of fiction.

All the novels of Miss Austin closely resemble each other; but *Northanger Abbey*, and *Sense and Sensibility*, are of a more puerile cast than the others, and betray a more unformed taste. *Pride and Prejudice*, particularly in the characters of the Bennets, was an improvement on the two former, but *Emma*, *Mansfield Park*, and *Persuasion* are justly regarded as her most finished works. Some scenes in *Persuasion*, the last work of this gifted authoress, have always appeared to us models of unobtrusive tenderness.

Some one has described the novels of Miss Edgeworth as a sort of essence of common-sense; and the definition is not inappropriate, for she is the most anti-sentimental of novelists. The sway of the stronger passions she has almost excluded from her Tales. Love is indeed the only one which has found entrance, and to qualify him for admission, his wings have been sorely clipped and trimmed, and reason constantly placed as a gentleman usher over him. Miss Edgeworth has even less toleration for splendid faults or bursts of enthusiasm than Miss Austin. Her chief aim is to rebuke folly by ridicule and comic humour; to unteach bad habits of mind, to substitute in their stead prudence, firmness, temper, perseverance, and habits of absolute truth, a process which she generally represents as effected by a gradual series of efforts and consequent ameliorations, which are within the power of all minds of ordinary resolution. Her favourite characters are either persons of well-balanced minds with sound heads and a smattering of physical science, who act rightly and honourably, but always think twice before they act, and weigh in the scales of utility what are generally considered as

Romance. matters of feeling, like the Percys : or they are personages who, spoiled by indolence and bad education, succeed by a course of self-discipline, in curing their intellectual or moral maladies, and becoming useful and honourable members of society, like the hero of *Ennui*, Lord Glen-thorn. Miss Edgeworth brings to her task the results of much observation of character, particularly that of her countrymen ; a quick perception of the humorous, a dramatic liveliness of dialogue, a high sense of all that is honourable and decorous, with a scorn of meanness and evasion, and that tone of good society which her pictures, often drawn from fashionable life, demand. If her novels are at times too obviously monitory and didactic, and the ferule peeps out rather alarmingly behind the schoolmistress, this defect, we fear, is in a great measure inseparable from the very qualities which constitute the strength of her mind, and from the conception she had formed for herself of the ideal of novel-writing.

Sir Walter Scott. At the period when Sir Walter Scott (1814) produced the first of that long file of romances which have since obtained a more than European reputation, the public taste, in regard to novel-writing, seemed to have sunk to a low ebb. Miss Edgeworth indeed was popular ; for the wit and good sense of her dialogue, and her happy pictures of Irish character, found favour in the sight even of the readers of circulating-libraries ; but the merits of Miss Austin's more unobtrusive pictures of life were comparatively unknown. At best she was confounded with the writers of "Winters in London," or "Winters in Paris," and shared a dubious favour with the romantic effusions of Francis Lathom and the other labourers of the *Minerva* press, so called, we presume, upon the *lucus a non lucendo* principle, from the goddess of wisdom having so little to do with its productions. Translations, too, from Augustus La Fontaine's homely but rather vulgar pictures of little German *Krah-winkel* towns, or the broad and indecent extravagances of Pigault Le Brun, tended still further to degrade and vulgarize the public taste. Everything in fiction, in short, looked unpromising and exhausted. The appearance of a great writer, who should strike out a new path through this much-trodden waste, seemed at that moment in the highest degree improbable. And yet this was at once effected by the author of *Waverley*, in such a manner as to raise the romance from the lowest level to the very highest position in literature.

The resemblance of Scott's mind to that of Shakspeare has been often remarked, and with some justice ; for though even the most enthusiastic admirers of the romance-writer, will hardly venture to claim for him an equality of powers with Shakspeare, there were strong kindred features in the character of their minds. In both we are struck with the same general and almost universal sympathies, leading to impartial and kindly views of all men and all opinions, the most remote from their own ; a cheerful, healthful tone of feeling, which brightens existence about us, instead of dwelling on its evils ; an avoidance of all moral casuistry, or treading on the borders of the forbidden, either in the creation of characters or of incidents ; the feeling of the humorous as strongly developed as the sensibilities of the imagination ; great self-possession, and a noiseless exertion of power, working out its end, not by sudden bursts, or high-wrought passages, but by a silent and steady progression, like the dawn brightening into the fulness of day.

If Scott possessed any excellency in a greater measure than Shakspeare, it lies in the wonderful art with which he has contrived to impress the reader with the reality of the scenes which he describes at their several historical periods. He has been able to mark most distinctly the age to which each separate story belongs, by a modification in the style and language of the dialogue, by a careful avoidance of

anachronisms, by representing his characters as knowing neither more nor less than was appropriate to personages in their respective spheres, and by the most minute and careful attention to manners and costume. His extensive miscellaneous reading and great antiquarian research no doubt contributed much to his success in this important point ; but we must also allow to him the possession of an innate faculty of producing *vraisemblance*, almost amounting to an instinct, no matter what period of history he selects for his tale ; whatever that may be, he carries us back to the precise age which he has determined to illustrate ; and the shadows which he summons from the vast realm of his imagination speak, think, and act, move and have their being, precisely as we have been accustomed, though more faintly, to create for ourselves ideal images of their prototypes. Does he take us to the time of the Crusades ?—how chivalrous in its tone, yet how mingled with ignorance and ferocity, is the conversation of the mail-clad barons ; how tinctured with barbaric thought and feeling is the utterance of the serfs and thralls ! Does he bid us tarry at the era of the Reformation ?—how marked are the natural differences of the priest and preacher, how vivid are the pictures of the savage moss-troopers, of the turbulent and ambitious nobles, of the euphuistic courtier who has taught himself to speak in the stilted language of the Arcadia ! Does he introduce us to the period of the civil wars ?—Cavalier and Puritan start to life again as they moved before the fight at Naseby ! Shakspeare, on the contrary, very rarely, and never strongly, indicates *period* by language. His characters for the most part might belong to any age ; sometimes they are even made to talk absurdly and incongruously. The bleeding soldier in *Macbeth*, who relates to King Duncan the issue of the battle with the Norwegians, speaks in a style totally out of keeping with his character. There is no antiquity about *Cymbeline* ; even *Hamlet* does not mark its era. Shakspeare certainly did possess in a very high degree the faculty of depicting national differences of temperament, and even national differences of scenery. The cold, stern, Norse-like tone of *Hamlet* is in marked opposition to the warm colouring of *Romeo and Juliet*. But he did not reproduce the past with anything like the vividness of Scott. Many subsequent writers have attempted in this particular to rival the great Scottish novelist, but never with complete success. The most famous of them, Sir Edward Bulwer Lytton, has in two at least of his works, *The Last Days of Pompeii*, and *The Last of the Barons*, striven hard to give them an impress of entire *vraisemblance* corresponding to the peculiarities of the time ; but it is no disparagement to the acknowledged powers of that eminent writer to assert that, in this respect, he is decidedly inferior to Scott. With the one it is an effort conspicuous in every page ; the characters being too antique, and too elaborate in their antiquity. They are too carefully primitive in their talk, like masquers who strive to the uttermost to keep up a show of what they are not, without hoping to impose upon their audience. We at once can detect the modern under the ancient garb, by the very pains which he takes to stalk solemnly on the cothurnus. With the other there is no effort whatever. He waves his wand more potent than that of Prospero, and the shadows of the olden time appear before us, and we absolutely believe in their re-animation.

Setting aside this notable peculiarity, we may remark that the works of Scott produce their effect rather by the combination of many qualities than the predominance of any. His strength lies in the possession and harmonious adjustment of most of the qualities requisite to the novelist, none engrossing the whole mind, none excluding another, but all working together in kindly unison : learning arrayed in the most picturesque combinations ; observation of life embodied, not in abstractions, but in living forms ; humour

Romance.

Romance. springing out of tenderness, like smiles struggling through tears; the spirit of ancient knighthood leavening the worldly wisdom of modern times; and the imagination of the poet adorning, without impairing the common sympathies and good-humoured sagacity of the man.

The department in which this combination of qualities has been most successfully displayed by Scott was that of the historical romance—a class of fictions which he may truly be said to have created. For although fictions bearing the title of historical romances were by no means uncommon in English literature before the time of Scott, such as the *Recess* of Miss Lee or the *Scottish Chiefs* of Miss Porter, it is apparent that they stand in a totally different class; not being, in fact, historical except in the names of the characters. Obvious as the idea now appears, Scott was in truth the first to show how much invention might gain by a union with reality; what additional probability, interest, and importance might be given to the fortunes of imaginary heroes, by interweaving their destinies with those of historical personages; nay, how much of romance in its finest forms lies in the characters and events of history itself, invisible to the prosaic or merely philosophic observer, but obvious at once to the eye of imagination. He has carried the picturesque of history to its perfection; for without imparting to his portraits the deep and subtle traits by which Shakspeare so wonderfully individualizes the beings of his dramas, he never fails at least to present consistent and striking pictures of his historical personages in their habit as they lived, and to dispose the light and shadow about them with the most felicitous adjustment—dress, look, gestures, manner, and the outward accompaniments of scenery being all made important accessories to heighten the effect of well-known peculiarities, or to hide the want of those over which Time has dropped a veil which even Imagination can hardly raise.

In description indeed, generally, Sir Walter Scott was unrivalled. Whatever he sees with the eye of the mind shapes itself into words which enable us to see it too. His pictures combine in a singular way breadth and minuteness; for while he painted the details with sharpness and firmness, no one understood better the art of arrangement in masses, so that he never fails to give the spirit as well as the form of the spot, making us *feel* the solemnity and gloom of castles and diuidical forests, the calm produced by the still beauty of a Highland lake from which the morning mist is disappearing, or the healthy elevation of spirits with which we travel up some mountain height, whence we see far into the country beyond, and “feel the breath of heaven fresh blowing.”

We offer no remarks upon his characters except this, that making every allowance for repetitions, no writer of fiction since Shakspeare has enriched the portrait gallery of invention with more originals, of which we have a distinct conception; and that though his female characters have less variety and less truth than his male personages, we know no writer except Shakspeare to whom the same remark may not justly be applied.

The plots of Scott, speaking generally, are neither remarkable for excellence nor the reverse. Examples may, in fact, be found in the long list of his romances both of skilful and defective plots. *Ivanhoe*, *Kenilworth*, and the *Bride of Lammermoor*, for instance, are proofs how artfully he could at times arrange his plan; the two latter having all the compactness and steady progression of the drama. Others again, such as *The Monastery*, *St Ronan's Well*, and *Rob Roy*, are in a high degree loose and inconsequential.

Fertile and inventive as was the genius of Scott, it cannot, we think, be denied that, during the latter half of his career as a writer of fiction, he appeared to less advantage.

No wonder, indeed, when, in addition to the limits by which all invention is bounded, we consider under what depressing circumstances many of his later works were composed, that in these even the elasticity of genius itself should be somewhat outworn and deadened; that the conventional, both in character and incident, should occasionally supply the place of invention, and that mere imagery, and not always very appropriate illustration, should be substituted for the natural turns which at first enlivened the dialogue. “If there be a mental drudgery,” to use his own words in his notice of Charlotte Smith, “which lowers the spirits and lacerates the nerves like the toil of the slave, it is that which is exacted by literary composition when the heart is not in unison with the work on which the head is employed.” When he breaks up new ground, as in *Nigel*, *Quentin Durward*, and *The Crusaders*, his genius indeed suffers little diminution; but in *Redgauntlet*, *Anne of Geierstein*, and *The Betrothed*, the practised skill of the mechanist, re-composing old materials in new shapes, is far more visible than the freshness and spontaneity of an original inspiration. With the publication of *Kenilworth*, indeed, the sun of his fame may be said to have “touched the highest point of all its greatness;” but like that luminary during a polar summer, it seemed for a time rather to revolve than to descend, and its rays continued to look bright and beautiful long after it was journeying towards the west.

No writer ever exercised so great an influence over the public mind, or led to so much conscious or unconscious imitation. His influence on Italy, France, and Germany, we shall afterwards have occasion to notice. On the literature of Great Britain we believe it to have exerted on the whole a most beneficial effect; not, indeed, that any professed imitation of his manner has yet appeared which possesses great claims to genius, but that he has carried a higher spirit into novel-writing; taught us how the simple feelings of peasants, and the homely pathos of humble life, and the relatings of feeling amongst the outcasts of society, might be made to blend with scenes of high imagination; that his writings are calculated to strengthen the ties of our common humanity; that they never tend to foster a bad, or to throw ridicule upon a good or generous feeling; while, speaking of them in a merely literary point of view, they taught lessons of simplicity, good taste, moderation, and skill in seizing the best points both of character and description, which have not been without their effect even on those by whom the mere manner of Scott or his choice of subjects have been studiously avoided.

The professed imitators of Scott have been numerous, but not successful. As usual, they have magnified his defects, urging his conventional personages, such as dwarfs, fools, gypsies, and bores, into caricature; multiplying instead of retrenching those similes which, even in the original, were so obtrusively frequent as to remind us of Bayes' rule for writing dialogue, “ever make a simile when you are surprised;” and overlaying the plot with minute descriptions of dress and scenery, which the reader, after a little experience, is wise enough to avoid.

The best imitation of Sir Walter Scott's manner with James and which we are acquainted is the anonymous romance of Cooper. *Forman*, of which he speaks with respect in his criticism on Mrs Radcliffe. The romances of Mr James, too, though not indicating much depth, are pleasing, always written with good feeling, and with a plot which excites a sort of quiet interest, if it does not keep the mind in the chain of curiosity or suspense. The novels of Cooper, who is probably better known than any other of the imitators of Scott, seem to be considerably overrated. On shipboard, or on an Indian heath, he is striking and picturesque; but among civilized society, and, above all, in his attempts

Romance. to catch the ease of fashion, we must regard him as singularly unsuccessful.

Hope. A strange contrast to the spirit of Scott's novels was exhibited in the sceptical and dreary tone of *Anastastus*. Without force of character-painting, with much languor in parts, and too prolonged a detail of heartlessness and villainy, the work fascinates by its strength, and towards the close, when the character of the hero deepens, by its irresistible pathos. Commencing with the levity of a Greek *Gil Blas*, it modulates into a key of sadness and desolation of spirit which reminds us of the close of *St Leon*. Fiction has few pictures which will bear comparison with that of *Anastastus* sitting on the steps of the lazaretto of Trieste, with his dying boy in his arms.

Many other authors, of considerable literary reputation about this time entered the field of fiction; indeed, very few entirely abstained from wandering in that direction.

Moore. Thomas Moore produced one novel, *The Epicurean*, in which some of the excellences and many of the defects traceable in his poetical style are apparent. We believe, indeed, that the original intention of the author was to have framed a metrical romance, but that he was induced to alter his plan and adopt the vehicle of prose, on account of its more extensive popularity.

Wilson. The *Lights and Shadows of Scottish Life*, by Professor Wilson, is a work which still retains in a great measure its earlier popularity. It is a book *sui generis*; not perhaps accurate in its delineations, but marvellously attractive as an idealization of peasant life by one who was a true poet, and who invested every subject which he touched with the light of his varied genius. Scarcely less popular and attractive is his other romance, the *Trials of Margaret Lindsay*, a most pathetic story, the perusal of which cannot fail to excite feelings of the deepest emotion. It is somewhat remarkable that this great writer, who possessed in an eminent degree the faculty of humour and the power of expressing it (as witness his inimitable *Noctes Ambrosianæ*) should nevertheless have shrunk, with an almost superstitious dread, from exhibiting it in his more elaborate writings. Nothing can be more certain than that the union or alternation of humour and sentiment, the mixture of the comic and tragic elements, has a charm unattainable by the exertion of one faculty only; and we consider this self-imposed abnegation of half his power to be the reason why Wilson's popularity as a novelist is inferior to that which he has attained as a miscellaneous writer.

Galt. Of a very different stamp was John Galt, who, possessing little pathetic power, revelled in descriptions of the ludicrous and absurd, chiefly as displayed in commercial life and among the middle classes. Galt drew accurately from nature in so far as character was concerned; and it is not too much to say that he has no rival, even at the present day, in framing portraits which, while absolutely true, are irresistibly comic and captivating. In this respect he is infinitely superior to Mr Dickens, whose characters are for the most part caricatures. Galt was no caricaturist. He drew accurately from the life; his secret being, that he thoroughly understood, appreciated, and enjoyed the foibles of that class of persons which he selected for illustration, and very wisely abstained from exaggerating, where, in truth, exaggeration would have spoiled rather than augmented the effect. His range is no doubt very limited; for it extends chiefly, if not altogether, to citizen life in the west of Scotland, and therefore the fidelity of his portraits can hardly be appreciated by those who are unacquainted with the class which he describes. But it may fairly be questioned whether even Sir Walter Scott has exhibited more truthful delineations of Scottish character than Galt has done in his Sir Andrew Wylie, Leddy Grippy, and Dr Pringle.

Another writer of nearly the same date rivalled Galt in

his peculiar walk. We allude to Mrs Johnston, authoress of *Clan Albin*, and of a tale called the *West Country Exclusives*, which is not nearly so well known as its intrinsic merit deserves.

Romance.
Mrs Johnston.

Several novels of great merit appeared when the reputation and popularity of Scott was at its zenith, and, though they did not absolutely suffer adumbration, were yet, in some measure, less regarded than they probably would have been had the great planet not been in the ascendant. The fact is, that Scott had acquired nearly a monopoly in fiction; for his fertility was so great that the reading public had scarcely digested one work of his before another was laid before them, and the established favourite gained simply from his popularity an immense advantage over any new competitor. That was the natural and well-earned result of his incessant labour and versatility.

The novels of Miss Ferrier, which are three in number, *Miss Ferrier's Marriage*, *Inheritance*, and *Destiny*, are decidedly of a high class, and have much interest, from the art of the writer in depicting shades of character. With a keen appreciation of the ludicrous Miss Ferrier combined the utmost delicacy of sentiment; so that her pictures are never overcharged, though abounding in native humour. One great charm of her novels is their thoroughly religious tendency, and the wholesome lessons which they convey, not obtrusively paraded nor pharisaically set forward, but tempering and pervading the whole with a benignant Christian spirit. Her main object was to illustrate, through fiction, the uses of adversity, and to prove how worthless are the riches, honours, and ambition of this world in comparison with a mind tranquillized by the influences of religion, and in the enjoyment of that inward peace which passeth all understanding. Of her success there can be no doubt; for in the whole library of fiction there are no works which can be more safely recommended for the perusal of the young, as calculated at once to improve, delight, and amuse, than the novels of Miss Ferrier.

The novel of *Cyril Thornton*, by Captain Hamilton, brother of the distinguished philosopher and metaphysician, Sir William Hamilton, is of sufficient merit to demand especial notice. So also are the novels of Mr J. G. Lockhart (Sir Walter Scott's son-in-law and biographer), *Valerius*, *Reginald Dalton*, and *Adam Blair*. The first of these, *Valerius*, which is a story of imperial Rome, is one of the best attempts which have been made by modern romancers to depict society in times which are purely classical. A fine and elegant scholar, without being in any degree a pedant, possessed of a vivid imagination, and master of a polished style, Mr Lockhart was peculiarly fitted to undertake the task, or rather the experiment, of reviving classical associations through the medium of fiction. Our deliberate opinion is, that complete success in such an attempt is impossible. Historical periods which are little known to the great mass of readers, and in which individual characters loom largely, though undefined, in their outline, like objects seen through a mist, may be selected by the romancer for illustration with the happiest results. Thus Scott, when he introduces us to Richard Cœur de Lion in Palestine, chief of the Christian army encamped around the walls of Acre, is like an enchanter who dispels a cloud which our own imagination, for lack of perspicuity, has never penetrated; and presents to us a spectacle of which we had never formed any conception. But there is no such cloud between us and imperial Rome. Her history, constitution, games, customs, magnates, manners, are known to all who are imbued with the slightest touch of the classical spirit; or, if not known absolutely, in the strictest acceptance of the word, they have been imagined by us; so that each of us possesses a floating Roman microcosm of his own. The

Romance. consequence is, that each individual reader being beforehand provided with a distinct picture of his own, tests the work of the modern resuscitator by comparison with that picture; and, as the two representations can never be exactly the same, he will not accord to the romancer that amount of credence or fictitious interest without which no story can be read with positive pleasure or absorption. He laughs at Prospero, and has no real belief in his power of evoking the spirits. These remarks may explain why classical novels have never been popular in England; and they may serve, moreover, as a practical illustration of the adage, "*Omne ignotum pro magnifico*." Certainly it was not from want of talent or descriptive power that *Valerius* did not prove a general favourite. *Reginald Dalton*, though it contains some powerful passages, is loosely put together; but *Adam Blair* is beyond all question Lockhart's greatest effort. It is a story harrowing to read, verging upon limits which prudery would shrink from, but true to nature; and, in the field of romance occupying nearly the same place which the plays of George Lillo hold in the dramatic literature of England.

Fashion-able novels. The public taste having been attracted to prose works of fiction as the most agreeable form of light reading, a whole host of labourers offered themselves as candidates for employment in the vineyard. The immense circulation of the novels of Scott, and the high remunerative price which he was known to have received from the publishers, proved as irresistible a temptation to literary adventurers as is the discovery of a new gold-field to the unemployed population of a continent. Ingenuity was racked for subjects. Fashionable life was supposed, not without reason, to have some interest for those of the middle classes, always furnishing a large number of readers, who lived beyond its pale; and accordingly the market was inundated with novels, each in three volumes, purporting to give glimpses of the serene existence of the arbiters of Almack's, and containing revelations of the mysteries of the boudoir and the ball-room. It is no exaggeration to say, that neither before nor since has there ever been such a deluge of absolute inanity. The few debutants in print who really had the means of describing such society from actual knowledge, were for the most part needy dowagers, illiterate dangles, or very impudent pretenders; yet such was the rage, at one time, for anything which savoured of high life, that large sums were given by a certain class of publishers for novels of the most trashy description, provided the author or authoress had a name recognisable in the *Court Guide* or in the *Peerage*. Such exclusiveness, however, in dealing with an exclusive subject, could not be maintained; and novels purporting to depict the etherealization of fashion, the sayings and doings of the earthly Olympus, were fabricated by clever rogues, who drew their inspiration from the pot-house. We are bound to say that, in point of talent, the mere imitators excelled those who professed to draw from reality. Both were most ludicrous caricaturists; but while we yawned over the platitudes of the one class of writers, mirth was actively excited by the preposterous misconceptions of the other.

Sir E. B. Lytton. A few brilliant exceptions, however, redeemed the fashionable novel from the charge of utter inanity. Sir E. B. Lytton, now unquestionably the greatest living novelist of England, laid the foundation of his fame by the publication of *Pelham, or the Adventures of a Gentleman*, a work which we are constrained to place in the fashionable catalogue, though much of its interest arises from scenes and characters remote from the fashionable ken. *Pelham* contains more than the promise of genius; it is a very remarkable and able work, which, though inferior in artistic skill to some of the author's later productions, is full of freshness and power, and after the lapse of thirty years still retains its popularity.

The fashionable novels of Mrs Gore, of which *Cecil* is certainly the best, at one time attracted much public attention, and though singularly deficient in plot, exhibited much vivacity in the dialogue, with considerable shrewdness of observation. Romance.
Mrs Gore.

To this class also belong the novels of Theodore Hook, a man of talent and versatility rather than genius, but possessed of a ready and sparkling wit, effervescent and exhilarating as champagne. Unfortunately, from imprudence and the pressure of untoward circumstances, he was compelled to undertake a larger amount of literary task-work than is compatible with the production of works deliberately planned and artistically executed. Hence his writings are very unequal—some being nearly worthless, while others are of excellent quality. *Gilbert Gurney* is, in our opinion, the best novel that he produced. Theodore Hook.

After a time, that portion of the reading public which is the mainstay of circulating-libraries became wearied with the fashionable frivolities and tiresome iteration of scenes pertaining to the *beau monde*. The demand for such literary syllabubs declined, and the value of copyrights dwindled. Then arose a new school of novelists, who sought to win the public ear, disgusted with drawing-room prattle, by converse of another kind. They selected their heroes, not from the frequenters of the saloon or boudoir, but from the denizens of the haunts of vice and profligacy. They had recourse to the caves of a modern Adullam, and, with the *Newgate Calendar* as their guide, tried to cast a halo of romance around the persons of executed thieves and murderers. Ruffians whose lives had been justly forfeited to the outraged laws of their country were depicted as men of daring, honour, and noble emprise; and their miscellaneous amours with women of the most abandoned class were detailed, not satirically, as Gay did in his *Beggar's Opera*, but seriously and minutely, in a manner which was at once a scandal to literature and an outrage upon public decency. Fortunately, however, the public taste, though not always discriminating or fastidious, revolted from so nauseous a dose; and after a very brief period, the Newgate novelists were hooted into silence, but not before they had done serious mischief by the repetition of their immoralities in a dramatic form, through low theatres and the like, thereby materially contributing to the population of the jails. Writers of this kind have been fain to take shelter under what they call the authority of the great masters of fiction. They say that, because Scott has made interesting and romantic such lawless characters as Robin Hood or Rob Roy, they are entitled to do the same by their recent despisers of the laws. The answer is very plain: Robin Hood and Rob Roy were outlaws and freebooters in times and countries when law was not established or recognised. Their period is mythical to us, and has long since passed away; but the thief, and housebreaker, and resetter, if not the highwayman (for railroads have interfered with that branch of the predatory business), still exist among us; and it can hardly be expected that we should take an interest in the chivalry of crime, which, any night, might be exhibited to ourselves through the medium of the dark lantern, with its concomitant the crowbar.

It would be tedious to note all the forms of the modern novel, for their number is literally legion. We have military, nautical, artistic, musical, commercial, religious, political, and sporting novels in abundance; in fact, there is no phase of society which has not been thus illustrated. Among living English novelists, the following hold the highest place:—Sir E. B. Lytton, Charles Dickens, William Makepeace Thackeray, Samuel Warren, Charles Lever, and the Right Hon. Benjamin Disraeli. These stand in the foremost rank; and it is a remarkable proof of the consideration which is now accorded to literary men that two of them are Cabinet ministers, not less distinguished by Living novelists.

Romance. their ability as statesmen than by the genius exhibited in their works.

Italian romance.

No country has produced more novelists than Italy; but the Italian novel bears little analogy to what we understand by the term. Their novels were, in fact, originally prose versions of the same short tales, sometimes heroic, but more frequently turning on themes of gallantry or comic adventure, which formed the favourite subjects of the Trouveres. They were Fabliaux translated into Italian; and this character they retained for five centuries, from Boccaccio to Gozzi (1313-1786). The incidents are generally briefly given; there is little development of character or sentiment; or, where these are found, they exhibit rather separate scenes of life than anything having the interest of a compact whole. But if the incidents and characters have little development, the Italian novelists have indemnified themselves for this confinement by indulging in the utmost license of a pompous, circuitous, and unmeaning style. The facile beauty of the Italian language, "*Che spandì di parlar sì largo fiume*," has been the bane of their novelists. Boccaccio, the first and by far the greatest of the Italian novelists, indeed manages to impart to it a sort of garrulous grace; but in the hands of his imitators the contrast between the poverty of the idea and the rich garb of words with which it is invested assumes a ludicrous effect.

Never, perhaps, among so many novelists, was there so little of novelty. Instead of imitating nature, their avowed principle was to imitate Boccaccio, who, imparting to everything a soft and rose-coloured glow, was himself not remarkable for the closeness of his adherence to it. And hence, regarding the novel merely as a theme upon which they were to display all the brilliant variations of which the music of Italian speech was susceptible, they were contented to repeat in a great measure the same themes, to borrow, with a sort of easy impudence, their incidents from Boccaccio or from each other; and more anxious for the purity of their Tuscan than of their tales, of which by far the greater number turn on scenes of licentiousness or low humour, they seemed to think all other merits in the novel subordinate to that of being "written in very choice Italian."

Beyond the limits of Italy, Bandello (1554) and Cintio (whose *Hecatommithi* appeared in 1565) are almost the only novelists whose names are known to foreigners, if we except the *Belphegor* of the versatile Macchiavelli; and the chief interest connected with these novelists consists in the hints or materials furnished by them to Shakspeare, Massinger, Beaumont, and Fletcher, and our dramatic writers of the time of Elizabeth and James, to whom, indeed, these works, particularly those of Bandello, afforded a perfect storehouse for plots. Among the nine volumes of Bandello's works contained in the *Novelliero*, some interesting and a few pathetic tales may be pointed out; but Cintio's can have no interest in themselves except for those who love to sup full of horrors; for he was one of those wholesale dealers in the terrible who thought that poetical effect was to be produced by a vigorous operation on the nerves rather than the feelings, and therefore piqued himself, like the schoolmaster in *Gil Blas*, on massacring all the personages of his tragedies, even to the prompter.

Towards the close of the last century, a taste for novels in a style somewhat resembling our own appears to have gained ground, and several tales of a melancholy kind made their appearance. With these we do not profess to be acquainted; nor has any one which appeared prior to the *Promessi Sposi* of Manzoni attained the least reputation beyond Italy, with the exception of the *Ultime Lettere di Jacopo Ortis*, an early production of Ugo Foscolo (1802), and the result partly of a melancholy event occurring in his own family, and partly of the study of Goethe's *Werther*, by which the enthusiastic mind of Foscolo ap-

pears to have been very powerfully affected. Like *Werther*, it is a story of love and suicide, full of fervour, violence, and, to speak the truth, of absurdity; yet delivered with a species of eloquence, and a certain appearance of conviction, which, so far at least as regarded the expression of mental discomfort, and the misery arising from a total want of all fixed opinion, was perhaps sufficiently real. To the Italians, who knew little or nothing of Goethe, this stormy effervescence of an impassioned temperament, and all this eloquent "questioning of fate," possessed even an air of originality; and being the first successful attempt to introduce the sentimental romance of the school of Rousseau and Goethe into Italy, it naturally awakened a degree of enthusiasm which now appears somewhat disproportioned to its real merit.

The *Promessi Sposi* of Manzoni certainly approaches much more nearly to the idea of a good romance than anything which Italy has yet produced; but, after all, it too is essentially an imitation. If we had had no Scott we should have had no Manzoni. The idea of illustrating a subject connected with the Italian history of the commencement of the seventeenth century; the introduction of historical characters, such as that of Cardinal Borromeo, who is the *deus ex machina* of the piece; the antiquarian lore displayed in the way in which the bread-riot in Milan (a close parallel to the insurrection of the Liegeois in *Quentin Durward*), is wrought up; the account of the plague in the Milanese, in which Manzoni has tried to imitate at once Boccaccio and Scott,—all concur to satisfy us that Manzoni, though an able lyric poet, has no great share of original invention, and that though he can make a good use of materials furnished by others, he is one of those literary commercialists who require to borrow the main portion of the capital with which they are to trade. We are far, however, from denying the real merits of this performance of Manzoni, in which the characters of Cardinal Borromeo, and the peasant hero and heroine, Renzo and Lucia, are naturally and pleasingly drawn, and in which some of the scenes, such as the opening scene at Don Abbondio's house, the riot in Milan, the interview between the unknown and the Cardinal, and some of the incidents and descriptions connected with the plague, are of vivid interest.

Since the appearance of the romance of Manzoni, who has lately abandoned both fiction and poetry for religion, many attempts have been made by Rosini, D'Azeglio, Guerazzi, Tommaseo, Belmonte, and others, to transfer the historical romance to an Italian soil, and to give a romantic interest to the delineation of the Italian feudal history of the middle ages, or of periods somewhat later. The first, and we believe the best, of these appears to be the *Monaca di Monza* of Rosini, who has founded his story on an episode in the *Promessi Sposi*. Were we to form a judgment from a few of these attempts which we have read, as to the merits of those of which we remain ignorant, we should be inclined to say, generally, that nothing is more remarkable than the total want of interest which Italian subjects possess in Italian hands; a result which appears the more singular since at one time it was only necessary in our English romances to transfer the scene to Italy, to enlist at once our warmest sympathies in favour of the story. Now-a-days, we think, when the subject is almost entirely in the hands of native novel-writers, the very idea of embarking on an Italian story of the middle ages seems to act upon the fancy as the most powerful refrigerative. Strangely enough, too, it is to be observed that the Italian novelists of modern times never appear to greater advantage than in the description of the most furious battles, carried on with all the determination and bloody-mindedness of an Esplandian or a Bobadil, as in *Ettore Fieramosca*, by Massimo D'Azeglio, a son-in-law of Manzoni, or *L'Assedio di Firenze*, by Gualandi; an expenditure of

Romance.

Romance. valour on paper which we fear is scarcely justified by the fact, since, if we are to give credit to the accounts of Guacciardini, many of their most doughty encounters were as harmless in their results as the protracted passage of arms between Gymnast and Tripet in *Rabelais*, as to which uncle Toby, after listening to an endless detail of the various complicated manœuvres, declared that one home-thrust of the bayonet would have been worth them all.

Spanish
romance.

In Spain, which, though not the birth-place, had certainly become by adoption pre-eminently the country of the chivalrous romance, and where, perhaps, its extravagances had been less redeemed by talent than anywhere else, it is well known that a revolution in taste was effected by the inimitable satire of Cervantes (1547-1616), which Montesquieu, with amusing extravagance, describes as the single admirable book in the Spanish language which shows the absurdity of all the rest. So effectually, indeed, did that work (published in 1605) attain its end, or rather one of its ends, that after its appearance no romance of chivalry appeared in Spain, and the old ones so entirely ceased to be printed that it is with difficulty that copies of them are now to be obtained. The "ultimus Romanorum," the last adherent of the good old romance, was Don Juan de Silva y Toledo, who published his *Don Policisnè de Boecia* in 1602, three years before the appearance of the *Don Quixote*.

Cervantes.

But had that book been solely devoted to the object of exploding the old romances of chivalry, it would probably have shortly been forgotten with the extravagances it exposed. The charm which has given a perennial life and continued popularity to *Don Quixote* is the deeper idea which it contains of illustrating in comic colours the contest between imagination and reality; the danger, both to its possessor and to others, of all misdirected enthusiasm, whether it take the direction of reviving an extinct age of chivalry, or any other course plainly running counter to the current of society all around it, by means of which a constant collision is produced, in which, whatever becomes of the world, the visionary himself is sure to be the sufferer. For the fuller development of this idea he has placed beside the knight, who represents the imagination without the common-sense, a squire who is the type of the vulgar common-sense without the imagination. Between these children of his brain he parcels out the treasures of his mind, bequeathing to the knight his own high spirit and courage, his learning, his generosity, and his love of truth; and to the squire the solid riches of his good sense and his peculiar humour; that humour which, as it exists in Cervantes, is among the rarest of human qualities,—the very poetry of the comic, founded on tender sympathy with all forms of existence, though displaying itself in sportive reflection; and issuing not in superficial laughter, but in still smiles, the source of which lies far deeper.

The characters and fortunes of these contrasted companions he has linked together in such a way as to impress on the mind the feeling how indispensable each is to each as the complement of the other,—the learning, high-mindedness, and strong imagination of the knight as the creative and moving power in human life; the practical good sense, and even selfishness, of the squire as the controlling force; from the judicious union of which opposites arises the harmony, and from their separation the discords of society. He paints also, with great knowledge of human life, the effect which these reciprocal influences, constantly exerted on each other through vicinity and a common pursuit, have in modifying even the original character itself, and gradually making the enthusiast more rational, and the commonplace man of the world more imaginative. The sound philosophy, the impartial and kindly spirit, with which Cervantes has wrought out this conception, in which justice is done at once to the higher and the more common ele-

ments of our nature; the flood of humour with which he surrounded it,—which has tempted many a one since the days of Philip IV. to imitate the pantomime of the student on the banks of the Manzanares,—are as obvious to the least refined of readers as they are models of art worthy of the admiration and profound study of every writer of fiction. Like human life itself, the story unites and harmonizes the opposite extremes of the pathetic and the ludicrous, the vulgar and the elevated,—for from the midst of the comic ground-work, the striking scenes in the Sierra Morena, the episode of Cardenio and Dorothea, the story of the captive, the sweet pastoral of Marcelia, the marriage of Camacho, and many other passages, rise up, rich in pathos, grandeur, or imagination; so that, in fact, there is no work in which, while the aim at first might appear to be to destroy the romance of life, passages of more purely romantic beauty are to be found. The truth is, that Cervantes, though anxious to explode a vicious taste in literature, was far enough from wishing to direct his satire against the creations of high imagination or against the spirit of chivalry. The admiration he expressed for Amadis and Palmerin shows that he was not insensible to the beauties by which even this branch of literature was occasionally redeemed. His own adventurous career of glory and misfortune had no doubt deeply impressed upon his mind the contrast between the dreams of imagination and the realities of life; he saw the poetical capabilities which such a contrast afforded,—and he has painted them with an unshrinking and some may think a merciless hand. But even beneath the veil of ridicule with which he has invested his crazed and battered hero, we perceive his own inextinguishable love of the exalted principles by which he is actuated; and the abiding impression which remains with us after the comic effect of the romance has passed away is, that truth and nobleness of character will continue to command our love and veneration, though displayed in actions with which the world cannot sympathize, and placing their possessor in situations which excite our ridicule, even while his motives attract our admiration.

Cervantes seems to have intended his moral novels (*Novelas Ejemplares*) to be to Spain what the short tales of Boccaccio and his followers had been to Italy, only with the advantage of a purer morality. They are unequal; some being mere satirical trifles, such as the *Licenciado Vidriera*; others, like the *Jealous Extremaduran* (which English readers will recognise in the common farce of the Padlock), the *Gipsy*, and the *English Spanish Lady*, highly interesting in themselves, and characteristic of Spanish manners, laying open to us, as Sismondi says, the hearts and houses of its inhabitants. One novel, the *Tia fingida* (Pretended Aunt), though undoubtedly written by Cervantes, was not included in the original collection, probably from the disagreeable nature of the subject.

The remaining work of fiction by Cervantes, the *Perisiles* and *Sigismunda*, is only remarkable as the last work which he wrote, and as being quite as absurd and extravagant as any of those romances of chivalry against which his powerful satire had been directed. No work has occasioned a greater division of opinion. While some of the Spanish critics speak of it in terms of extravagant praise, it is described by Viardot, a French critic, as "a tissue of episodes interlaced with each other, like those of one of Calderon's intrigues, consisting of extravagant adventures, silly rencontres, astounding prodigies, preposterous characters, and extravagant sentiments." It retains little or nothing indeed of Cervantes but the charm of his style. Yet, like Corneille placing his *Nicomede* before the *Cid*, or Milton his *Paradise Regained* before his *Paradise Lost*, Cervantes seems to have given the preference to this child of his old age over the masterpiece of his manhood.

The fashion of short novels in the Italian taste which

Ejemplares.

Romance. had been introduced by Cervantes was followed by Lope, Canizares, Zayas, Montalvan, and by a host of imitators, whose very names the Spanish critic Lampillas declares that he is unable to enumerate. The loss of the catalogue is little to be regretted; for even among the names which are known it would be difficult to point out one, even including the great Lope, which rises above mediocrity. Nature indeed seems to have given Cervantes his revenge for the triumph of his rival in the drama by the failure of Lope as a novelist, for in this department the talent and rich invention which he displayed on the stage appeared in a great measure to desert him. The best of his novels is the *Fortunas de Diana* (Fortunes of Diana), first printed in the *Filomena* in 1621; next to which we should place his *El Zeloso hasta Morir* (Jealousy till Death); but, truth to say, neither are remarkable. Indeed, if we except Cervantes, the same remark which we have ventured to make on Lope is generally applicable to the Spanish novelists. Nearly in proportion to the success of the nation in the creation of an original drama is its signal deficiency in original contributions to the literature of romance. It is not often indeed, as Tieck remarks in his Preface to Bulow's *Novellenbuch*,¹ that the dramatic and novelistic power are found combined in a national literature to the same extent as in England.

Romances in the *Gusto Picaresco*. In fact, the only species of prose fiction, with the exception of *Don Quixote*, in which the Spaniards have displayed anything like original invention, is in the novels written in what is called the *Gusto Picaresco*, or the romances of roguery, of which the first example of any merit, and, with one exception, the best of the whole series, was furnished by the *Lazarillo de Tormes* of the celebrated Don Diego de Mendoza, and is said to have been written by him while a student at Salamanca, and first printed in 1553. It is rather singular, no doubt, to find a man of rank devoting himself to those pictures of want and miserable knavery, or a nation affecting so much external pomp and ceremony relishing these exposures of the real filth, meanness, or starvation which often lurked under the cloak of the whiskered knight of Calatrava. But the Spanish character is distinguished by a very peculiar vein of dry humour intermingled with a tinge of orientalism in their notions of birth and pride of ancestry and personal dignity; and hence the Spanish novelists seem to have been perfectly alive to the ridiculous features of their countrymen, while sharing very probably in the same exaggerated pretensions themselves. Accordingly, along with the adventures of rogues, and beggars, and gipsies, who, during the reigns of the Austrian Philips, appear to have literally swarmed in Madrid, are interspersed ample illustrations of this union of poverty and pride, and the stratagems with which many a pompous cavalier, walking the streets, as Lazarillo says, like the Duke of Arcos, is occupied at home in order "to procure a crust of dry bread, and having eat it, to appear with due decorum in public, by the art of fitting on a ruffle so as to suggest the idea of a shirt, and adjusting a cloak in such a manner as to make it be believed there are clothes under it."² Mendoza's novel contains a sketch of one of these shirtless and famished hidalgos eagerly devouring some crusts which Lazarillo had begged in the morning, on pretence of trying whether the bread was sufficiently wholesome, which gives an image of starvation in which the painful is strangely blended with a sort of sombre gaiety.

Aleman and Quevedo. Equal, if not superior, to Mendoza's romance is the *Guzman d'Alfarache* of Matteo Aleman (1599), which, though dealing in the same gloomy pictures of want and misery, has

Romance. more variety in its pictures, and a more severe and caustic character in its sarcasm. It has been erroneously supposed to have furnished many particulars to Gil Blas; in fact it would be difficult to point out one, except the incident of the parasite who obtains a supper at the expense of the eighth wonder of the world. In the same taste is the *Gran Tacano* of Quevedo.

The merit of having supplied Le Sage with much of his Espinel materials may be more plausibly claimed by Vicente Espinel, the author of the *Vida del Escudero Marcos de Obregon*, printed in 1618. Indeed, while the superior grace, spirit, and gay philosophy of Le Sage are apparent, it is impossible not to make a considerable deduction from his mere invention after reading the work of Espinel. The prologue, the adventure of the parasite, the dispersion of the company at Cacabelos by the muleteer, the adventure of the robber's cave, the surprise by the corsairs, the contributions levied by those pious hermits, Don Raphael and Ambrose de Lamela, the service with the Duke of Lerma, and many of the other incidents, have nearly an exact parallel in the ruder and drier work of Espinel. Even some of the witty points, which we might be disposed at first sight to believe were Le Sage's, turn out to be the property of the Spanish chaplain,—such as Don Matthias de Silva's reply, when asked to fight a duel early in the morning, that he never rose before one even for a party of pleasure, and could not be expected to rise at six to have his throat cut.

This much, however, must be said for Le Sage, that he shows no desire to conceal the source of his obligations, for one of his characters is termed Marcos Obregon, and the Sangrado of his novel is undisguisedly the Sagredo of Espinel. Le Sage, however, knew that after every deduction was made on the score of invention, the merit of his novel would remain much the same. He threw lightness and sunshine into the mean and gloomy pictures of the Spaniards, taking care to efface the recollections of folly and knavery in his adventurers by a cheerful and respectable termination of their career; and though the graduation of the fool into the knave, and the knave into the honest man, upon a mere principle of utility, be not perhaps in itself a very lofty moral, it is at all events far more agreeable than that of the Spanish novelists, where the rogue continues such to the last, and his only advancement is to a higher degree in the curriculum of knavery. A romance of a more pleasing and political cast than these tales of knavery was the historical romance, the *Civil Wars of Granada*, by Gines Perez de la Hita, printed in 1604, turning on the dissensions of the Zegrís and Abencerrages during the reign of Boabdil, and giving occasion, as might be expected, to many fine descriptions of tournaments, feasts of canes, Moorish palaces and gardens, and the contrast between the Christian and the Moorish chivalry. From this romance Florian has mainly borrowed the idea and materials of his *Gonsalvo of Cordova*.

One other work of fiction deserving notice, though partaking more of the nature of the satire than the novel, is the *Fray Gerundio* (Friar Gerund) of the Jesuit De l'Isle, —a severe, but rather tedious satire upon the absurdities and bad taste of the popular preachers of the time. In romantic literature the Spaniards at the present day seem to be entirely deficient. Translations of the popular French and English novels abound, but native talent or invention appears to be at an end.

In France the pastoral romances of D'Urfé and his imitators, and the heroic romances of Gomberville, Scudery, French romances and novels.

¹ Das Novellenbuch, oder hundert Novellen nach alten Italienischen, Spanischen, Französischen, Lateinischen, Englischen, und Deutschen, bearbeitet von Eduard von Bulow, Leipzig, 1834. An excellent anthology, from the shorter literature of romance in the above languages; and not a mere translation, but in many cases a dexterous rifacimento, true to the spirit, while avoiding the dulness or indecency of the original.

² Dunlop's *History of Fiction*, vol. iii., p. 119.

Romance. and Calprenede, whose object was "peindre Caton galant et Brutus dameret," were succeeded by an inundation of Fairy tales. *contes des fées* and *voyages imaginaires*, appearing about the close of the seventeenth and the commencement of the eighteenth century. This species of nursery literature, which, like the character of the fair Arricidia in *Clelia*, was "furieusement extraordinaire et terriblement merveilleux," seemed peculiarly well suited to the frivolous tastes which then pervaded French society; and its temporary attraction was perhaps based in some degree upon the very want of reason and common-sense which rendered its permanent popularity impossible. When the sage Oglou in Voltaire asked the sultan, "Comment preferez vous des contes que sont sans raison et que ne signifient rien," the answer of the sultan was, "C'est précisément pour cela que nous les aimons."

Perrault, D'Aulnoy, Murat, La Force. The chief writers in this school of fiction, with whose compositions most of us have in our early days been rendered familiar through the little gilded volumes of Mr Newberry or his successors, were Perrault, the Countess D'Aulnoy, Madame Muat, and Mademoiselle de la Force, of whom Perrault is decidedly the best, his tales being distinguished by a simplicity and naiveté of style indispensable in this style of writing, and in which the productions of the ladies are deficient. No great share of original invention is displayed by any of them. The chief storehouse from which they drew was the *Notti Piacevoli* of the Italian novelist Straparola, and the very remarkable Neapolitan collection by Giambattista Basile, entitled the *Pentameron*, of which the first edition appeared in 1637.

A slightly different direction was given to this taste for marvels by the translation into French of the *Arabian Nights* by Galland, and of the *Persian Tales* by Petit de la Croix and Le Sage, which led to a host of oriental imitations. And the childishness and absurdity of the whole of this department of literature was exposed with great wit and liveliness by Count Antony Hamilton in his *Fleur d'Épine*, and in his unfinished tale of the *Four Facardins*.

Marivaux. But this same period was distinguished by the productions of some writers of a higher order: Marivaux (1688-1763), Prevot (1697-1763), and Le Sage (1668-1746). Marivaux had a good deal of Richardson's power of delicate portrait-painting, by an accumulation of miniature touches; nor is he deficient in the power of managing the interesting situations with which his *Marianne* especially abounds. And certainly, if we except Mademoiselle La Fayette's pleasing romance of the *Princess of Cleves*, he may claim the merit of having been the first in France to reduce the novel from mere extravagance, both of incident and character, to the standard of natural feeling, and to present us with real beings instead of fantastic creations of the imagination. His chief faults are his intolerable minuteness in trifles, and the affectation of the style, which is worthy of the society of the Hotel de Rambouillet. His best novel, too, the *Marianne*, terminates abruptly and inartificially, with a conclusion like that of *Zadig*, "where nothing is concluded."

Prevot. Prevot had a much higher and more romantic imagination than Marivaux. He threw into the novel something of the gloom and grandeur of tragedy; and hence he has been termed by some of his countrymen the Crebillon of romance. A visionary disposition and an ardent temperament had hurried him through a restless and passionate life, in which good and evil, suffering and enjoyment, had been scarcely blended; so that to the task of composition he brought the results of a mournful experience in aid of the resources of the imagination. To use the expression of Voltaire, "Il n'était pas seulement un auteur mais un homme, ayant connu et senti les passions." Prevot is not a great inventor of character; for to all his heroes, Cleveland, Patrice, even the Chevalier des Grieux, he appears

to have lent much of his own feelings and his own peculiarities of mind. Though an extremely voluminous novelist, none of his works appear now to be read or recollected except this painful but powerful story of *Manon l'Escaut*, a tale of crime and profligacy, strangely blended with generous feeling, which has been translated into English by Charlotte Smith. *Manon l'Escaut*, though little more than an episode, thrown off apparently with an easy negligence, bears the impress of genius, which it would be difficult to recognise in an authentic form in any of the larger productions of Prevot. Opening in the most unpromising manner, with what appears to be the common-place history of a vicious and discreditable connection between Des Grieux and Manon, in which weakness of principle on the one side is made the dupe of profligacy and vanity, united with personal charms, on the other, the stream of feeling, at first polluted and turbid, works itself purer as it runs; and the scenes rise into elevation just as the character of Manon herself, the "fair mischief" of the romance, around whom Prevot has thrown no common fascination, changes from the selfish mistress into the faithful companion, following the fortunes of her husband, whom her charms had ruined, into disgrace and banishment, and dying by his side among the wilds of America.

Love also forms the subject of the novels of Madame de Tencin (died 1749), the *Siege of Calais* and the *Count de Comminges*, which are admired for their tenderness and delicacy,—qualities we should hardly have anticipated from a lady who stood in so confidential a relation to the Cardinal Dubois, and who left her illegitimate child, D'Alembert, to the tender mercies of the public.

Le Sage. The greatest of the French novelists, however, is Le Sage. Even in his first romance, the *Diable Boiteux*, the plan of which has been suggested by the *Diablo Cojuelo* of Luis Valez de la Guevara, and which appeared in 1707, the wit, the graceful lightness, and the good-humoured sagacity of observation, which distinguished the character of Le Sage, were evident. The conception, in particular, of his esprit follet, a "diable bon-homme," with so much more gaiety than malice, that at times we are tempted to think him rather amiable than otherwise, was a great improvement on Guevara's; and the effect of the work was heightened by the skill with which he contrived to interweave with the story, if such it can be called, a multitude of contemporary allusions. Such indeed was its popularity and immediate sale, that two young men are said to have fought a duel in a bookseller's shop about their right to the only remaining copy; a well-attested anecdote, so much in the spirit of those satirical traits in which Asmodeus indulges that, as Sir Walter Scott remarks, it deserved to be recorded by the demon himself.

The reputation as a novelist which these most amusing revelations of Asmodeus had founded, was brought to its height by the production of the first three volumes of *Gil Blas*, bringing the history down to the retirement to Lirias,—a work, with the exception of *Don Quixote*, perhaps the most universally popular in fictitious writing, pleasing equally whether read in youth, in manhood, or in age, and containing, as has been justly said, more "useful knowledge" than twenty scientific and moral treatises. Le Sage's celebrated novel represents the level of life as it appears in a large capital, without either its brightest lights or its darkest shadows. He exhibits the average state of feeling among such communities,—loving virtue and good conduct within due bounds, but at the same time with that natural toleration for selfishness, servility, vanity, or occasional deviations from the path of strict integrity, which in such society is certain to be engendered and countenanced. As he saw nothing like an elevated morality in the world with which he was best acquainted,—the Parisian public,—so he has not attempted to introduce any such exalted tone of

Romance. feeling into his romance. His hero is an adventurer, to whom a hundred parallels might probably have been pointed out any evening among the audiences at the Foire, with fair abilities, with a kindly heart, and naturally good inclinations, but little moral firmness; by no means so enamoured of the straight road of right as not to turn aside occasionally when the deviation suits his purposes; duped at first by his own vanity, and then availing himself of his dear-bought experience to take his revenge on others in the same coin, but still with a gradually increasing preference for good conduct and virtue, and a secret determination, when a favourable opportunity offers, and his fortune is made, of becoming in due course an honest man.

To this conception of an agreeable rogue, refined partly by good feeling, and partly by calculation, into a better being, Le Sage has imparted a wonderful air of particular combined with general truth; for though *Gil Blas* is the representative of so wide a class, that almost all must acknowledge at times some common, and perhaps not very flattering features of resemblance between ourselves and him, he preserves throughout his whole career the most distinct individuality of character. Nor are the other subsidiary agents of the novel deficient in distinctness and clearness of portraiture. Sangrado, Scipio, the sleek Ambrose de Lamela, the eloquent but apoplectic archbishop, are made to stand before us. The historical personages have the same look of truth. Lerma and Olivarez, in particular, are admirably painted; so much so, that some Spanish critics, like De l'Isle and Llorente, have zealously maintained that Le Sage merely translated from some unknown Spanish manuscript which he had plundered. These critics reason, in fact, in such an ingenious way as to make the accuracy or inaccuracy of Le Sage's Spanish pictures equally available for their argument. If he be perfectly correct in his portraits of manners and his allusions to Spanish customs, that part of the work, they maintain, could not have been written by any but a Spaniard. If he falls into mistakes, it is equally clear that these apparent slips were introduced by him on purpose to hide the source of his depredations, and to confuse, like Cacus, the traces of his retreat. It is needless to say that the statement, at least as made in this unqualified form, is totally incorrect. Le Sage had no doubt thoroughly imbued himself with the spirit of the Spanish humour, as it appeared in Cervantes and the writers of the Picaresco school; and, as already said, he borrowed liberally incidents from various Spanish romances; but he lent to the whole a point, gaiety, and philosophy, which presented the old materials with all the appearance of novelty, and the charm of an original invention. "All is easy and good-humoured, gay, light, and lively; even the cavern of the robbers is illuminated with a ray of that wit with which Le Sage enlightens his whole narrative. It is a work which renders the reader pleased with himself and with mankind; where faults are placed before him in the light of follies rather than vices; and where misfortunes are so interwoven with the ludicrous that we laugh in the very act of sympathizing with them. All is rendered diverting, both the crimes and the retribution which follows them."¹

Though Le Sage rightly considered his characters as his chief object, he was well aware of the pleasing relief which might be given to his story by the judicious combination of the repose of landscape-painting with the bustle of incident; and though he does not succeed in bringing before us with the vividness of Cervantes the sombre and parched plains or rugged mountain scenery of Spain, his work contains some country pictures, in a style of placid beauty, which are models of stillness, comfort, and serenity. To whom, for instance, does not that modest demesne at Lirias, watered by the Guadalquivir, with its mansion-house

Romance. of four little pavilions, its garden bordered with orange trees, and ornamented with its basin of white marble, and the quaint, respectable, old Moorish furniture of the apartments, not to mention the *olla podrida* of Master Joachim, and the revenue of 500 ducats a year, rise up before the mind's eye as the very ideal of that happy rural retreat which, to each of us, is to be the Euthanasia of a life of carefulness and toil; making us long for the time when we may be able to say with its fortunate possessor,—

"Inveni portum; spes et fortuna valeat
Sat me iusistis, ludite nunc alios."

It is unnecessary to dwell long on the romances of the younger Crebillon (1707–1777), as to which the only circumstance which is remarkable is, that so much frivolity of manner and real poverty of invention could have obtained a temporary popularity even by the license in which they indulged; yet that they were very popular for a time, we know; for Sterne represents his *fille de chambre* inquiring at a circulating library for the *Egarements du Cœur et de l'Esprit* in 1768. French writers, however, appear to recognise in his pictures some resemblance to the society of the time; for D'Alembert says of him, "he draws with a delicate and just pencil the refinement, the shades and the graces, of our vices."

Much higher talent, though, like Crebillon's, stained by Diderot, a shameful association with licentious and profligate pictures, appears in the romances of Diderot (1713–1784). His talent as a narrator, in particular, was scarcely inferior to Voltaire's. He had the picturesque particularity of Richardson, with a more condensed expression. It is not, however, in his larger and more notorious romances, such as the *Religieuse*, that this talent is displayed. In these the tedium is as conspicuous as the indecency and impiety. It is in such short tales as *L'Histoire de Mademoiselle de la Chaux*, or *Les Deux Ams de la Bourbonne*, short popular simple histories, contrasting strongly with that air of false simplicity, in reality tricked out with sentimental fard and tinsel, which Marmontel (1719–1798) has given to his Marmontel amusing but not very moral tales.

The romances of Voltaire (1694–1778), such as *Zadig*, Voltaire's the *Princess of Babylon*, *Babouk*, and *Candide*, have but romances. slender pretensions to the title. They are chiefly satirical fictions or illustrations in the form of a tale of irreligious or antisocial opinions. Their wit, their biting irony, their familiarity with the baser parts of human nature, their power of rendering trifles pleasing by the art of narration, are undeniable; but we must not look in them for probable incident, for Voltaire generally chooses, as if on purpose, some extravagant oriental groundwork as his canvas, and borrows from Ariosto, from Gulliver, from the *Arabian Nights*, or any source which suits his purpose; nor for the delineation of natural characters, for both the incidents and personages are merely made the instruments for working out the preconceived theorem. They produce their effect, such as it is, not by their fidelity to nature, but by the ingenious malice with which its features are distorted.

From the time of Marivaux downwards, the tendency of the French novel had been to narrow the province of incident, and to extend proportionally that of sentiment. With Rousseau (1712–1778) this tendency reaches its height. Rousseau. The description of feelings, and particularly of such as, though often experienced, are seldom expressed in words, was his peculiar field. Invention, either of character or incident, he has none. To paint one strong passion, to invest vice with an air of insane but reasoning morality,—

"To make madness beautiful, and cast
O'er erring deeds and thoughts a heavenly hue
Of words like sunbeams, dazzling as they pass;—

this is the main aim of his *Julie*, and the only one in which

¹ Sir Walter Scott's *Lives of the Novelists*—Le Sage.

Romance.

Rousseau has been at all successful. Even in this respect, too, the declamatory tone, the continued delirium of feeling, the total want of repose, which characterize the work, combined with the pedantry of its dissertations, become painful and oppressive. "Ce sont des amans," said Rousseau himself, speaking of his characters, "et non pas des academiciens." Never was an apology more misplaced. The real fault of *Julie* and *St Preux* is, that they have both too much of the academician in their composition, and too little of the lover, so far as the expression of natural passion in simple words is concerned. We have never been able, in reading the romance, to persuade ourselves that its real eloquence was not as dubious as its morality. It is not easy, indeed, in perusing Rousseau's apostrophes to purity and virtue, to avoid thinking of the strange commentary which his practice furnished to his theory. It was said of Sterne with severity, but perhaps with some justice, that he could bestow upon a dead ass the pity which he denied to a living mother. And the man of nature and of truth, who expends his trembling sensibilities on paper, suffers a fellow-servant to be punished for the theft he had himself committed, and provides for his natural children in the foundling hospital.

The total corruption of an exhausted society, tottering to its fall, with the external varnish of gaiety and wit by which it tried to gild its decay, are aptly represented in the licentious romances of Louvet and La Clos; its still more vulgar profligacy in the coarse and incoherent, but occasionally striking and original novels of Restif de la Bretonne (1734-1806.) The works of the two former writers are unfortunately but too well known; the numerous and hasty productions of the eccentric printer, who was accustomed often to set up his strange compositions in type, without a manuscript, as the ideas occurred to him, are now almost completely forgotten. Yet Schiller and several eminent German critics have spoken with high approbation of the vigour and talent which they evince in some parts, however defective or revolting in others. "I have scarcely imagined anything," says Restif, in his *Drame de la Vie*; "I have simply related; my life has been so full of events, that I have made four-and-twenty volumes out of it." Any one, indeed, who writes, as Laharpe says of Restif, in his *Correspondence Russe*, under the persuasion that all that he had seen and thought, or learnt, deserved to be printed, and who acted faithfully on that principle, could hardly fail to produce compositions with very nearly the merits and demerits of the novels of Restif; that is to say, with the coarseness of feeling which was natural to the man, with the disjointed air which a set of unconnected incidents from life must present, and yet with that degree of freshness and truthfulness of painting which sketches from life almost invariably possess, however humble or disagreeable may be the department from which they are drawn. His best novel is usually considered to be the *Paysan Pervers*, which appeared in 1776.

Two writers may be pointed out, however, about this period, who were the representatives, if not of a better taste, at least of better feelings.

St Pierre.

Bernardin de St Pierre (1737-1814) may be regarded as the connecting-link between the eighteenth and the nineteenth century: a graft of Fenelon upon Rousseau. His pathos no doubt often merges in a weakly sentimentalism; but the calm idyllic beauty of the *Paul and Virginia* and the *Indian Cottage* (1789-1792) was not without its use in restoring to French literature a feeling for nature and its simple enjoyments, and the acknowledgment of a Providence, a belief which both philosophy and fiction had for some time past been labouring to obliterate.

The defects of St Pierre, with very little of his redeeming excellences, appear in the *Atala*, *Rene*, and *Natchez* of Chateaubriand. He is, no doubt, in some departments an original thinker, and a man of a poetical imagination, though

a degree of vagueness and mysticism mingles even with the best of his works; but as a novelist, his sickly sentiment and exaggeration of feeling are fatal to his success.

When the limbo of the Revolution, after its billowy heaving began to settle again into something like a calm, under the despotism of the Consulate, the novel took the direction of broad and extravagant humour, derived from the gaieties and vulgarities of middle life, and, as might naturally be expected, liberally sprinkled with indecency, in the voluminous novels of Pigault Le Brun,—to whom it would be unfair to deny considerable powers of broad mirth, and a fertility in imaginary burlesque situations which remind us of Smollett. But the questionable character of the novel-writing of this period is not universal. In the tales of Madame Cottin, the authoress of *Elizabeth and Mathilde*, a pure morality and feminine tenderness reappear; and though those of Madame de Staël, with all their eloquence, occasionally inculcate more doubtful lessons, her genuine admiration for pure and elevated feeling prevents her from willingly lending her talents to the palliation of vice. The novels of Madame de Staël, however, are far more German in their character than French.

The works of the literary veteran Nodier certainly owe their attractions more to the charms of a beautiful style than to their substance. Throughout his whole course he has been but an imitator, putting on successively the manner of other writers. The *Werther* of Goethe appears to have first given the tone to his novels, and the passionate energy and wild complaints of the German suicide were reproduced in his tale of *Therese Aubert*. To the influence of Goethe succeeded that of Byron, and the spirit of the *Corsair* and *Lara* were infused into the bandit *Jean Sbogar*. From Byron he passed to Scott, whom he has imitated in his *Trilby, ou le lutin d'Argail*,—a production, the effect of which, though meant to be serious and pathetic, is unintentionally of the most comic kind, for the "tricksy spirit" of Argyle in the hands of Nodier becomes one of the most absurd of supernatural conceptions. In his *Smarra*, again, a Thessalian story in the manner of the sorceries and diableries in the Golden Ass of Apuleius, he seems to have been influenced by the German night-pieces of the school of Hoffmann; and he certainly succeeds almost as well as his German master in producing a strange ephialtic effect by a cloud of misty, murky phantoms, which pass before us as if in a feverish and uneasy dream.

With the restoration of the Bourbons, some degree of external decency at least distinguished the productions of the French press, though still the license which its novelists permitted to themselves in their comic works, and the extravagant and terrible cast of their more tragic stories, indicated at once a looseness of morality and a coarseness of taste which might, in some measure, have prepared the world for that strange and revolting spectacle which the literature of fiction has presented in France since the Revolution of 1830. The manner of Pigault Le Brun was imitated and improved upon by Paul de Kock; for, adopting his principle of drawing chiefly from middle life, and his love for the representation of comic mischances, he has thrown into the best of his novels scenes of simple humour, of tenderness, and even of powerful passion, to which the novelist of the Revolution had made no pretensions. To sneer at him as a Parisian cockney, or as the romance-writer of the Grisettes, is easy; but we are much mistaken if his tales, homely and even coarse as they may be, will not be read when the atrocities of Sue and Masson, and the delicate depravities of Balzac, are forgotten.

In the higher sphere of romance we have, during the same period, the earlier productions of Victor Hugo, *Hans Hugo of Iceland* and *Bug Jargal*. *Hans of Iceland*, wild and extravagant as it is, is evidently not the work of an ordinary writer. A stern, savage, northern spirit is breathed into

Romance.

Romance. the romance. Spiagudry, Orugix, even the monster from whom the tale derives its name, strange and ghastly creations as they are, exercise a certain fascination over the mind; and the youthful poet has turned to great account the dreary wilds, gloomy lakes, stormy seas, and ruined fortresses of Scandinavia. *Bug Jargal* was decidedly inferior to *Hans of Iceland*. The essential improbability in the character of a Negro passionately in love with a white woman, and yet tempering the wildest passion with the deepest respect, is obvious; nor is that improbability disguised by the art with which Hugo has framed his story. There was more of genius, we think, in his *Dernier Jour d'un Condamné*, in which Hugo, like Sterne, has taken a single captive, shut him up in his dungeon, and then "looked through the twilight of the grated door to take his picture." In this little work he has shown how a profound interest might be given to a mere register of sensations, and a dramatic movement imparted to a monologue, in which the scene shifts only from the Bicêtre to the Conciergerie, the Hotel de Ville, and the Place de Grève. Hugo's great novel, *Notre Dame de Paris*, appeared in 1831. It is needless to speak of a work which has been more than once translated into English; and the characteristics of which, the mingled genius and extravagance, the poetical spirit in which it is conceived, and the want of nature in the characters which it portrays, resembling distorted and hideous masques rather than men, are now very generally and correctly appreciated.

The popularity of the romances of Scott led, about the same time, to a multitude of imitations by Jacob and others, of which the *Cinq Mars* of Alfred de Vigny appears to be generally considered the most successful.

We have no idea of entering on that mass of revolting performances, equally offensive to good morals and good taste, with which the French press has teemed since 1830; and which we are but too happy to consider, with the French themselves, as a literature of transition. This school of blood and voluptuousness, funereal horrors and drunken orgies, the transitions in which remind one of the stage arrangement in the *Rehearsal*,—"the coffin opens, and a banquet is discovered,"—we feel assured can be of no long duration; and already we believe that the French public begin to feel that they have had enough of the endless Balzac, and Janin, and Sue, and Soulie, and Masson, and the other labourers in this Montfaucon of fiction. As for Madame Dudevant or George Sand,—the Chevalier d'Eon of French literature,—a being whose sex it would be impossible to ascertain from her works, with the warm passions and headlong eloquence of the woman, and the audacious speculation of the man,—while the principles which she labours to inculcate are of the most odious nature, and the cynical hardihood with which she paints scenes from which any woman would turn aside, is perhaps the very worst proof which French literature at present presents of a degraded standard of delicacy and right feeling among the female sex,—we cannot deny that she appears to us to possess far greater talent, even genius, though misdirected, than any of the other ephemeral novelists to which we have alluded. In particular, she has an imagination singularly alive to natural beauty; her pictures of scenery are frequently captivating; and one evening landscape of Venice, in her *Lettres Venetiennes*, has the combined charm of deep sensibility and truth. By far the most pleasing of her novels, because it in a great measure keeps in the background her peculiar opinions, is *André*. And yet even the general purity and right feeling of the tale is marred and interrupted by some passages which English readers at least would wish to blot.

The field of the novel or romance is not that which has been cultivated in Germany with the most success. The

labourers indeed have been many; the produce most abundant; but the quality of the harvest is at best equivocal. Down to the time of Goethe and Tieck, the German literature of fiction was almost entirely imitative, deriving both its form and spirit from other nations. Since their time, if it presents a greater air of originality, it has generally assumed a character so fantastic, so unreal, so unlike all that we have been accustomed to associate with the idea of a novel, that it is extremely difficult to comprehend what is really the conception of the word entertained in Germany.

As we have no very high idea of the German prose fictions, the space which we propose to devote to them will be extremely limited; for we shall confine ourselves to a mere indication of the successive phases which the German romance has presented. In doing so, it seems unnecessary to go back beyond the latter portion of the eighteenth century, or to revive the names of works and authors which even the Germans themselves have forgotten. The earlier part of the eighteenth century had been occupied with numerous imitations of the *Robinson Crusoe* of Defoe, or of the family pictures of Richardson, the merits of which are not of a nature to demand notice in the present sketch.

In the Greek romances of Wieland (1763-1812), such as the *Agathon*, the *Aristippus*, *Peregrinus Proteus*, and *Agathodamon*, the same didactic tendency is observable which distinguishes those of Voltaire, but without their cynical and mocking tone, and with a much greater power, if not of actually inventing character, at least of working up the scanty materials furnished by history into a consistent and plausible portrait of the historical personages of antiquity; as in his *Socrates*, and still more perhaps in his *Aristippus*. The main fault of his novels, besides this didactic tone, which pervades them all, is the frequent repetitions which they contain of the same views and personages. *Agathon* in one manner, and the *Abderites* in the other, contain the germ of almost all Wieland's other writings. The sceptical Hippias, for instance, only puts off the Athenian stole in *Agathon*, to assume the mantle of the *Calendar*; the *Danæ* of that novel revives again in *Theoclea* and *Devidassi*; the youth of *Athagon*, in *Delphi*, is the prototype of that of *Peregrinus* in *Parium*; and many such instances must occur to any one familiar with Wieland. He is a mannerist, in short, as to his matter, and the mannerism extends even to his style, which, though flowing and facile, has not a little of the solemn loquacity of Boccaccio. This diffuseness is less felt in his shorter tales, where his philosophy is not so obtrusively displayed; and for this reason we prefer his *Don Sylvio de Rosalva*,—the history of a Quixotic believer in fairyism, gradually converted to common-sense by the extravagant demands which are made upon his belief, assisted by the charms of a mortal beauty,—and his little romance of the *Salamander and the Statue*, to his more elaborate and aspiring compositions.

The influence of the novels of Richardson and of Fielding re-appears about this time in a liberal effusion of family novels, some portraying the serious and sentimental, others the comic aspect of domestic life. Among the sentimental novelists, Augustus La Fontaine (1758-1831) may be considered as the most successful, and undoubtedly the most popular. He painted life as he had seen it in the little German towns, villages, and chateaux of respectable proprietors about him, or as he had witnessed it during his campaigns as army chaplain, without ornament or alteration, without any pretension to imagination; and though there is at times something vulgar and tawdry in his sentimentalism, there is also a great deal of quiet simple nature in such scenes of common life and domestic happiness as he has exhibited in his family of Haller; and a tone of frankness and

Romance.
German
novels and
romances.

La Fontaine.

Romance. good humour which carries the reader pleasingly along through incidents and characters that in themselves are common-place enough.

Comic romances. The comedy of family life found numerous representatives, of whom Wetzel, Muller, Schulz, and Hippel, attracted some notice in their day and generation. Even yet the *Siegfried von Lindenberg* of Muller, which appeared about 1779, and of which many editions have appeared, may be admitted to be a natural and amusing performance.

Richter. A union of the sentimental with the comic in these domestic pictures was attempted at a somewhat later date in the very singular novels of Richter (1763-1825), a man of high powers, which he knew not how to use, and which were alloyed in no common degree by false taste and an incurable affectation of singularity. His earliest novel, the *Gronlandische Processe*, appeared in 1784. The tricks and clap-traps to which Sterne occasionally descends we find habitual with Richter. The very titles of some of his works, such as *Selections from the Papers of the Devil*, or *Recreations under the Cranium of a Giantess*, and the absurd devices by which he generally introduces his narration, as in the *Hesperus*, where a series of letters is represented as mysteriously conveyed to the author in letter-bags tied round the neck of a shock-dog, betray a mind anxious to astonish by fantastic conceits, and insensible to the beauty of simplicity. The constant recurrence of these instances of literary quackery, the want of connection which his chaotic narrations exhibit, combined with the visionary cast of his views, justifying his own remark, that the empire of the Germans was peculiarly that of the air, has been fatal, and we think justly, to all attempts to naturalize Richter in this country. His pathos we think in the worst style of false and often meaningless effusions of sentimentality; but as a quiet humourist, blending good feeling with his satire, he is sometimes not unsuccessful.

Feudal romances. A strong contrast to these pictures of ordinary life, whether serious or comic, was presented by the mass of romances connected with the feudal periods in Germany, which appeared from about 1780 to 1800, and formed the counterpart of the Ritter-stucken or chivalrous dramas with which the stage had been inundated since the example had been set by Goethe's *Goetz of Berlichingen* and Babo's *Otho of Wittlesbach*. Cramer, Spiess, Schlenker, and Veit Weber, (Leonhard Wachter), were the favourite writers of this turbulent school of fiction, which in all probability took its rise from the popularity of the romances of Mrs Radcliffe. Their materials were the blood-stained period of Faustrecht and Vehm-Gerichte, feudal tyrants, suffering damsels, devoted knights, with abundance of single combats and splintering of lances, raising of trap-doors, escapes by sliding pannels, imprisonments in bottomless dungeons, murders, witchcraft, and apparitions; in short, all that apparatus of the terrible, which, even in such hands, has a certain fascination for the boy, but awakens only a feeling of the ridiculous in the man.

Another department of German fictions, likewise dealing with the marvellous, but fortunately cultivated by writers of a very different order of talent, was the *Mahrchen*, or legendary tale. Three different modes may be pointed out in which this class of subjects has been treated.

The first is exemplified in the *Volksmarchen*, or popular tales of Musæus, in which the groundwork of marvellous tradition which the writer has selected is treated, not in the spirit of belief, but of a laughing scepticism, and where the writer relies for effect, not so much upon the interest of his materials, as upon the wit, the satirical allusions, and the quaint description or broad drollery which he is able to infuse into the original legend. Whatever in such traditions

bordered upon awe or terror, Musæus rejected; he viewed even these creations of the fancy in a prosaic light, and selected only such features as could be wrought into his ingenious mosaic of fanciful marvel, picturesque description, and sly and somewhat irreligious pleasantry, in the style of Voltaire. What he attempted, however, he accomplished with success. Some of his tales, such as *Stumme Liebe* (Dumb Love), and *Melechsala*, might be cited as models of the art of combining the childish interest of a nursery tale with that show of irony or philosophy which affords even to grave personages an apology for the perusal of popular tales.

In this semi-derisive style of treating the traditional legends of his country, Musæus remains the solitary writer of talent. This natural tendency of the German mind towards earnestness and belief, even in the case of the marvellous, led to a very decided preference of the serious manner in the treatment of such themes. And undoubtedly at the head of this second mode of treating the legend stand Ludwick Tieck (born 1773). Questionable as we think his claims are to the highest distinction, either as a poet or a novelist, in the proper sense of the term, his success in the management of traditional marvels in a poetical spirit is undeniable. He seems without an effort to throw himself back into the spirit of primitive and superstitious periods, when the agency of an invisible world formed an article of belief, and exercised the strongest influence over the conduct of life; a time of supposed prodigies, and omens, and secret charms, whose agency pervaded and controlled the course of nature. In reading the best of these legends of Tieck, such as *The Fair Eckbert*, *The Love Charm*, or *Peter of Abano*, we feel that he has the power of carrying us back in advanced age into the very realm of Fairyland, and subjecting us anew to the influences of childhood. "These legends have a freshness about them like that of the earliest morning, a sweetness as of wild flowers, and a calm beauty, caught as it were from a radiant sunset or a rising morn. The reader of the *Runenbergs* is brought face to face with the presiding spirits of the animal and vegetable kingdoms; now he feels as if he were embosomed in luxurious vegetation, bathed in fertilizing dew, and fanned by balmy zephyrs, and now as if he were transported to cavern depths or darkest mines, where mountain spirits exercise an unholy influence. All the other legends, *The Fair Eckbert*, *The Fairies*, and *The Trusty Eckhart*, have the same beauty and significance; but it is impossible by mere description to give any idea of their peculiar nature. They must be studied and felt to be at all understood."

We are here speaking of Tieck merely as the writer who has treated the traditional tale in the most poetical spirit. Within the domain of the novel, taking the term even in a very extensive sense, our estimate of his powers will be very different.

The mode of treating the legendary lore of Germany, of which the tales of Tieck had furnished the first example, as the most agreeable to the national character, soon found numerous, or, it might rather be said, numberless imitators. For the last thirty years the example of Tieck has been implicitly followed, and all the legendary novelists of Germany have been melancholy and gentlemanlike, after the pattern of the Phantastus. Of these, the writers best known to English readers, through translation, are the Baron de la Motte Fouque, the author of *Undine*, the *Magie Ring*, and *Sintram*; Chamisso, the author of *Peter Schlemihl*; and Apel, the author of the *Freyschutz*. It may be doubted whether better specimens of the German tale might not be selected from writers with which the English public is not familiar,—some of Henrich Steffens' short legendary stories in particular,—such as the *Sleeping Bride* (*Die Schlafende*

¹ Germany, by Bisset Hawkins, p. 126.

Romance.

Braut), and the *Nightly Betrothal in the Church of Rörwig* (Die Nächtliche Trauung im Kirche Rörwig), which have not yet found a translator, appear not undeserving of the attention of the lovers of the marvellous. In the wild productions of Achim von Arnim, such as the *Countess Dolores* and *Isabella of Egypt*, traits of talent sparkle in the midst of absurdity. And from the works of Clemens Brentano, and of Zshokke, the author of *Abelino*, several interesting legends might be selected. In particular, we are surprised that the simple and beautiful legendary tale by the former, "The History of the Brave Kasperl and the Fair Annerl," is yet untranslated.

Hoffmann.

The third form in which the Märchen was employed, but at the same time perverted from its proper purpose, and subjected to a more Mezentian union than it had submitted to even under the satirical despotism of Musæus, was in the fantastic or grotesquely terrible manner introduced by Hoffmann, and since his death so injudiciously and unsuccessfully imitated both in Germany and in France. Hoffmann's manner cannot be considered as entirely original, since an approach to it may be pointed out in the *Diable Amoureux* of Cazotte. It is singular, however, that his productions, such as the *Sandman*, the *Magnetizer*, the *Devil's Elixir*, and others of that class, deriving their whole interest and effect from their connection with the peculiar nature and idiosyncrasy of the writer's mind, and so incapable of being imitated with the least success by any one not possessing the same anomalous mental conformation and physical irritability with the Prussian judge, should have exercised a very decided though temporary influence over the literature, not merely of Germany, but of Europe; and it proves that, notwithstanding the extravagances, there does reside in them some charm,—something which appeals successfully, not, indeed, to the mind in its calmer mood, but to the imagination when in a state of temporary excitement. Only in such a mind as Hoffmann's, moulded into its existing shape by an ill-omened union of influences, mental and bodily, habitually haunted with gorgons and presentiments, seeing traces, as it were, of the devil's hoof in the commonest paths of life, and starting and trembling at the chimeras with which his imagination peopled solitudes—could the phantoms bred in his eccentric brain, and nurtured amidst the fumes of a Berlin tavern, have ever assumed that appearance of reality and belief which could render their introduction into a work of fiction at all practicable. Only by a mind accustomed, from a painful experience, to brood over and dissect the origin and connection of these strange phenomena, half mental half physical, which makes "life a dream," but with a nightmare accompaniment, could the possible connection of this phantasmagoria with real existence, in morbid minds, be rendered so far intelligible as to redeem them from the charge of the merest puerility. Hoffmann's tales, though they constantly suggest the idea that they have had their source in the inspiration of opium, seem really to be the only compositions in this style of grotesque horror which can be said to possess the redeeming quality of genius. They remind us of the images of our dreams, calling up before us, as in sleep, long perspectives of gloomy vastness, broken here and there by the light of the strangest *ignes fatui*, along which are seen, flitting in antic movements, bands of the most fantastic creatures, such as those which, in the pictures of Teniers, disturb the solitude of St Anthony, or which give a strange blending of the humorous and the horrible to the distempered sketches of Callot. Yet, as a proof that the talent of Hoffmann was by no means confined merely to the fantastic and the supernatural, we may notice his truthful and vigorous picture of the German burgher life of the middle ages, in his *Master Martin and his Apprentices*, and his *Mademoiselle de Scudery*, a tale of vivid and fascinating interest, founded on a historical groundwork, moving in the simplest

and most direct manner towards its object, and exciting the feeling of curiosity and suspense even to the last. Romance.

Some notoriety of an evil kind was obtained by a class of novels in which the attempt was made to invest sensuality with the graces of art, or to merge art in sensuality. Such were the *Ardinghello* of Heinse (1749–1803), in which painting was made the apology for the introduction of voluptuous pictures, and his *Heldegard von Hohenthal*, in which music was made to minister to a similar purpose,—no unfit sequel to a literary life which commenced with a translation of Petronius. In truth, in the whole range of the German novels, the tendency to an undue license of this kind is observable. In those of Goethe, though veiled by an appearance of decency, it is sufficiently perceptible; nor does Tieck appear free from the common taint. Many passages in *Wilhelm Meister* are highly objectionable; and such a novel as the *Wahlverwandschaften* we regard as untranslatable into English.

Of Goethe's novels we have already expressed our opinion in our biographical article on Goethe himself. If the merits of a novel consisted, not in exhibiting an epitome of human life, more or less poetically conceived, according to the prosaic or imaginative turn of the writer's mind, but in speculating ingeniously on painting, agriculture, landscape, gardening, the rules of good composition, or the state of the theatre, connecting these speculations by a thread of mystical narrative, and introducing us to a set of beings without the least trace of reality about them, who all appear to be playing some theatrical part in a dreamy representation of life, which seems to have no intelligible object,—Goethe may be a great novelist. With an English public, demanding some firm basis of reality, instead of that unsubstantial cloud-land which envelopes us in the *Wilhelm Meister's Lehrjahre* and *Wanderjahre*, and accustomed to insist on a plain meaning as a preliminary to poetical embellishment, he never can be a favourite. A novel which does not explain its purpose without a commentary seems to violate the essential laws of such compositions; but a novel, in regard to the object of which no two commentators agree is an anomaly in literature. Most of the German critics, indeed, though professing a great admiration of these singular performances of Goethe, are careful to confine their observations in regard to the meaning or object of the novels to the merest generalities. They describe *Wilhelm Meister*, to use the congenial language of an English admirer, as a picture of "warm, hearty, sunny, human endeavour, a free recognition of life in its depth, variety, and majesty, but as yet no divinity recognised there." The latter portion of the sentence is intelligible, and is unfortunately true, but the rest reminds us of Mr Dangle's remark, that the interpreter appears the harder to be understood of the two.

These observations apply, with slight modification, to the Tieck. novels of Tieck, when he abandons the province of the traditional tale, and attempts subjects connected with real life; the characters, the incidents, the whole cast of the tale, appear so extravagant, that, but for the grave and laudatory criticism with which these effusions seem invariably to be received by his countrymen, it would be difficult to believe the author serious. His first romance, *William Lovel*, was a gloomy and revolting extravagance, and his later caprices, such as *Das Alte Buch* (The Old Book), the *Vogelscheuche* (Scarecrow), *Eigensinn und Laune* (Self-will and Humour), *Wunderlichkeiten* (Marvels), are utterly unworthy of a man of genius. Even the merits of his *Dichterleben* (A Poet's Life), have been greatly exaggerated. Any tale in which Marlowe and Shakespeare figure as actors has a certain interest for a Briton; but beyond some eloquent disputations on the drama, and the formation of a poet's mind, in which Shakespeare and his companions are made to utter modern German theories, the most opposite to English notions of the sixteenth century, we cannot perceive

Romance. wherein the peculiar merit of this much-lauded performance lies. Tieck has said absurdly and presumptuously of Sir Walter Scott, that "it is surprising how little he wants to be a poet, but how much that little outweighs all that he is." Let any one who has read Tieck's *Aufbruch in den Cevennen*, in which he has come in competition with the Scotch novelist on an historical subject, judge whether he has himself made a nearer approximation to that character.

Schiller. The talent displayed by Schiller in his *Verbrecher aus Ehre*, and his fine fragment of the *Armenian, or the Ghost Seer*, excites regret that he did not give us less of philosophy, and more of fiction. The latter is an unfinished tale of mystery, of deep interest, the idea of which, it is supposed, was suggested by the juggleries of Cagliostro, and in which Schiller, though he never witnessed the scenery which he describes, has caught the spirit of silence and secrecy which seems to pervade Venice, with the same success as, in his *William Tell*, he has transported us into the mountain recesses of the Oberland. And Lord Byron has recorded the strong impression made upon his mind by the recollection of the incomprehensible Armenian, one of those conceptions which he was accustomed by anticipation to associate with the image of the city of the sea.

Several female novelists, too, have respectably supported the pretensions of their sex; such as Fanny Tarnow, the Baroness de la Motte Fouque, Johanna Schopenhauer, Henrietta Hanke, and Caroline Pichler, the able authoress of *Agathocles*. Many of their productions exhibit talent, grace, and facility of style; but we should be at a loss to name any for which the praise of genius could justly be claimed.

The class of romances called *Kriminal Geschichten*, turning on stories of secret guilt discovered by circumstantial evidence, has been a numerous one in Germany. At the head of this class of novelists stands Kruse, who certainly possesses in a high degree a power which at the present day appears to be rather a rare one, that of constructing an ingenious and complicated plot, keeping the curiosity constantly on the stretch, and defying conjecture as to the result, till the author himself chooses to furnish the solution. The *Ring, Oath and Conscience, Diodatis' Birth, the Dance of Death*, and the *Red Dragon*, are masterpieces in this style of invention, which, though of a sufficiently prosaic character, yet possesses at least this cardinal merit, that it is rarely tedious.

Historical romances have always been numerous in Germany; and after the appearance of those of Sir Walter Scott they became still more so. Some of the chivalrous pictures of Tromlitz, Van de Velde, and Blumenhagen, in this style, are spirited, but in general the historical romance of Germany does not rise above mediocrity. "Sunt bona, sunt quædam mediocria, sunt mala plura." Let us except the very remarkable tale of *Michael Kohlhaas*, by the unfortunate dramatist Kleist (1776-1811). In all of Kleist's tales there is too much of a spectral and fatalistic character; he delighted to contemplate and to delineate life as necessitated by a mysterious and iron destiny. *Kohlhaas* is not entirely free from a tinge of the supernatural, which harmonizes ill with the deep, humble, human interest of the tale itself; and nowhere does the idea of a grim and unrelenting fate appear in more saddening colours. There is truth, therefore, in Goethe's remark as to this romance, that "it brings prominently into view a dissonant principle in nature, with which poetry ought not to meddle, with which it cannot reconcile itself, let the handling of the matter be never so exquisite." And yet this vigorous and truthful picture from the Lutheran times must be to Eng-

Romance. lish readers an object of interest, from the contrast it exhibits to the usual style of the German novel; for it is told with a directness, a simplicity, a dramatic liveliness, and an absence of unnecessary reflection, which are qualities of rare occurrence beyond the Rhine.

Of late years the German, following the example of the English novelists, have somewhat enlarged their sphere; and have addressed themselves seriously to the portraiture of contemporaneous society, in its true living features, as contrasted with such vaguely sentimental, and decidedly erotic productions as the *Werther* and *Wahlverwandschaften* of Goethe. Several novels of this class have reached us, all of which exhibit more truthfulness and fidelity to nature than we find in the older writers; but, as a counterbalance, there is decidedly less imagination, and the characters, when original, and not borrowed from English authors, are commonplace and dull. The best of these novels is the *Sollen und Haben* (Debit and Credit) of Freytag, which is spirited, and conveys a faithful picture of life in Silesia, both in the noble and the mercantile circles. But it is impossible to read many pages of that novel without perceiving the extraordinary influence which the perusal of the works of Dickens has exercised over the mind of the author. *Issig the Jew*, and the old beer-drinking porter, are properties of Mr Dickens' which Freytag has unceremoniously appropriated. He has hit off the minute, quaint, and sometimes grotesque descriptive manner of the English novelist to the life; and in his more tragic situations the resemblance is so close as almost to have the effect of a parody. We may also notice a very pleasing tale of historical as well as domestic interest, entitled *Frederick the Great and his Merchant*, a good translation of which has recently been made by Lady Maxwell Wallace. The name of the author is not given; but if this is the first attempt of an aspiring novelist, we feel confident that it is only the precursor of greater works, and that Germany may yet (for she has not done so hitherto), produce a novelist worthy of a European reputation.

We must not exclude from this sketch a notice of Hans Andersen Christian Andersen, the Danish novelist, whose beautiful of Denmark have been translated into German, English, Dutch, and Russian. Without any pretensions to art, he has attained that which no study can give, a perfectly natural expression. Without resorting to the mechanism of verse, he touches intuitively and in succession the chords of human sympathy; and more almost than any other living author possesses the magical secret of endearing himself, through his works, to the reader, without exhibiting any trace of egotism or personal intrusion. Nor are high proofs of talent in the fictional department wanting in another region of Scandinavia. The Swedish novels of Frederica Bremer are well known in England through the medium of the translations by Mary Howitt; and though curiosity regarding the customs of a land comparatively unknown to us might account for some portion of the interest which they excited, their intrinsic merit alone fully warranted the introduction. Her novels are of the domestic kind, simple, and true to nature, without much pretension in the way of plot, but always graphic in description, distinct in delineation of character, and in sentiment irreproachable and refined. Less known perhaps to English readers, but yet deserving of notice, are the novels of Madame Carlen, also a Swede, whose writings display a strong imaginative tendency; some lines verging on that dubious and undefined manner which we are contented to designate as the "melodramatic." (G. M.—R.) (W. E. A.)

ROMAN HISTORY.

SECT. I.—SITE OF ROME.

Site of
Rome.

THE site of Rome occupies a cluster of low eminences threaded by the winding stream of the Tiber. The Campagna, the modern name for the tract of land which encompasses it, stretching from the sea to the Apennines, is not a wholly level surface, but is generally varied with gentle undulations. At one or two points only, such as in the neighbourhood of Alba and of Rome, this tameness of character is broken by more abrupt and prominent irregularities. The Alban hills soar in several peaks to an extreme altitude of 3000 feet, and inclose two deep basins filled with water; but the hills of Rome hardly attain 150 feet, and the Tiber, running among them, serves to drain the moisture descending from their flanks. The presence of marine deposits in the gravel which composes a portion of their soil shows that these hills have been raised in primitive times from the bed of an ocean; while the configuration of the hills themselves bears token of the volcanic agency by which this revolution was effected. On the left bank of the river they form a large segment of a circle, rising for the most part almost imperceptibly from the Campagna beyond, but falling more suddenly into the interior crater; while at either extremity, to the North and South, they descend abruptly into the bed of the Tiber. On the right they extend more irregularly along the river bank, rising at one point to a somewhat greater elevation; while the ridge of the Monte Mario, less closely connected with them, in the rear, reaches to a height of nearly 500 feet.

In the hollow formed by the circumvallation of the left bank stands a single hillock with a level summit and steep sides, well defined, and of figure nearly rectangular, measuring about 500 yards by 400. Removed about a quarter of a mile from the bank of the river, and almost screened from it by the advancing horns of the circumjacent ridge, screened still more effectually in early antiquity by the thick jungle which choked the valleys all around it, this hill—the Palatine, as it came in after ages to be called—could hardly be detected by the eyes of a stranger from beyond the limits of the inclosure. Such a site might naturally tempt the wandering brigands of Central Italy to fix on it their permanent settlements. Though traces may be discovered in the later manners of the Italians of their original descent from a race of nomades, yet we find them distinguished at the first dawn of history by the general adoption of settled habitations. The idea of the city, and of municipal institutions, was as strongly developed in Italy as in Greece; and in this respect the earliest known inhabitants of either peninsula were equally distinguished from the Gaul, the Briton, and the German. The strongholds of these people were the summits of bold eminences, such as rose sometimes in clusters, sometimes with insulated projections, from the plains or the scarped ridge of a mountain spur; and the cultivators of the little territory around them resided generally within the shelter of their walls. But the domain of the first fortress on the Palatine was limited by the conflicting claims of the occupants of similar retreats on almost every height around it. The Tarpeian hill, looking northward up the stream of the Tiber, was the site, according to an early legend, of a town denominated Saturnia; the Janiculan, across the river, bore a city of its own name; the Quirinal, which stood next in order to the Tarpeian, was settled by a tribe of Sabines, the people of the district reaching north-eastward to the Apennines; the Latins, who held, with a confederacy of thirty states, the great

plain of the Campagna to the south-east, had a place of meeting on the Aventine; the whole of the right bank of the Tiber belonged to the still more powerful nation of the Etruscans. The earliest legends of Rome indicate the seizure of the Palatine by an offset from a Latin tribe, and its conversion into a stronghold for the unsettled brigandage of the neighbourhood. But this confined and secluded eminence afforded a retreat indeed, but no sustenance, to its primeval occupants; and from the first the Romans were compelled by the sternest necessity to fight with every neighbour for their daily living. If constant warfare was thus, on the one hand, from the first the law of their existence, not less were they compelled in self-defence to seek alliances and cultivate peaceful relations on the other; and they soon learned to relax the rigid exclusiveness of manners and family ties which characterized the politics of the Italian races. While the martial temper of the Roman people was formed in the school of perpetual aggression or defence, they had the good fortune to be driven by circumstances to fraternize liberally with their allies and dependents, and the habit of admitting fresh infusions of foreign blood continued to be maintained by a necessity ever increasing as the sphere of their foreign relations widened. It was the remark of their own statesmen, as well as of later students of their history, that the illustrious career of Roman conquest was maintained by the seasonableness with which, however reluctantly, the franchise of the city, with all its privileges and burdens, was conceded at every crisis to strangers.

Political
History.

SECT. II.—DERIVATION OF THE ROMAN PEOPLE FROM ETRUSCANS, SABINES, AND LATINS.

Extending our view beyond the cluster of hills over which the name of Rome was eventually to be extended, we may observe, with the map of Italy before us, how critically the future mistress of the world was placed with reference to the powers around her. Three considerable nations, the names of which have been already mentioned, met just at this point. The Tiber, descending almost due south from the Apennines to the Mediterranean, and making with that sea an acute angle on the right, an obtuse one on the left, separated the country of the Etruscans from that of the Sabines and of the Latins. Again the Anio, running west from the central ridge of the peninsula, and striking perpendicularly upon the Tiber three miles above the spot just designated, formed the line of demarcation between the Sabines and the Latins themselves. Rome, therefore, was placed almost at the point of junction of the three rival nationalities.

Derivation
of the Roman
people
from Etrus-
cans, Sa-
bines, and
Latins.

The institution of the fortified city as the nucleus of the political combination, such as we find it to have existed throughout Central Italy in these early times, may be taken as a sign that the country is in possession of a foreign race, which has subdued the original inhabitants and holds their lands by the right of conquest. Wherever a tribe has settled upon soil hitherto unoccupied, we find that it has spread itself along the sides of the rivers and over fertile plains, clearing the forest rood by rood, and planting its scattered habitations securely on every spot to which chance or convenience has conducted it. Thus the inhabitants, first known to us, of Gaul and Germany, may seem to have been the aborigines of the land. They found perhaps on their arrival no prior possessors of the soil on which they planted themselves, and they had no need to defend their

Political
History.

acquisitions by the establishment of fortified posts and armed garrisons in the centre of every plot of ground they occupied. But in Italy, on the contrary, both tradition and early ethnological traces confirm our natural inference from the mode of its ancient inhabitation, and assure us that neither Etruscans, Sabines, nor Latins were aboriginal possessors of the peninsula, but were themselves intruders upon the heritage of feebler and probably more peaceful races. The early connection of these aborigines with the Greeks appears from the identity of many of their words, such especially as refer to agricultural usages and ideas. The formation of the Latin tongue is also closely allied to the Greek. This apparent identity of race we signalize by giving to the Italians the name of Pelasgians. But it is in these fragments of their language only that we can trace the character of this primitive people. The Sabines and Latins have conquered and degraded them; these new-comers have long maintained themselves in their fortified and inaccessible citadels, like the Norman barons in their castles, in the midst of their conquered serfs; and the institution of the city, remains to attest the fact of conquest, long after the elements of resistance which first suggested it have been trampled into the dust. Throughout the territory of the Etruscans the conquest has been even more complete. Here the conquered people have not left even a feeble trace of their existence in the language of their conquerors.

Resembling one another in this main feature of their politics, the Etruscans, the Sabines, and the Latins are distinguished in other important particulars. Whatever may have been the course of migration which led the Etruscans to their final seats in Central Italy, their early connection with the East seems proved from the character of their institutions. Their religion was a mystery and a craft, like the Egyptian and other eastern systems, jealously guarded and professionally communicated; though its priests were no longer on the freer soil of Italy a special caste like the Druids, the Magi, and the Brahmins, but were at the same time the warriors, the proprietors, and the statesmen of the commonwealth. Such was the Etruscan Lucumo, king, priest, soldier, and landlord, and such he maintained himself in spite of the advance of commercial ideas among the people, some of whose cities on the Tyrrhene coast had become emporia of the traffic of the Mediterranean. But in the eighth century B.C. the power of the Etruscans had already sustained a blow; they had lost their hold of the countries they once possessed north of the Apennines; the connection with their advanced posts in Latium and Campania seems to have been dislocated; they were confined to a confederacy of twelve cities in Etruria proper, strictly allied, and still by far the strongest and most important section of the Italian communities.

The Etruscan religion was a refined theosophy. It proclaimed the existence of a Supreme Being, a Providence or Fate, who was rather the soul of the world than a person exterior to it. The lesser gods, like those of Egypt and India, were emanations from this being. The world itself was subject to periodical mutations; men and things had their appointed courses; there was a future state of rewards and punishments. The Etruscans conceived, like other heathens, that the will of the divinity and the course of future events might be ascertained by the observation of omens. Their soothsayers drew auguries from the flight of birds, but they had a special gift of interpreting the signs of victims' entrails and of meteoric phenomena.

The religious ideas of the Sabines and Latins, on the other hand, were less refined, and affected less mystery. The indigenous cult of Italy had regarded the daily and common wants of men: the husbandman worshipped the genii of the winds and skies, the shepherd those who protected his flocks from the wild beast or the murrain, the warrior those by

whom his arrows were wafted to the mark or the crafty stratagem suggested. It was also domestic, and concerned the preservation of property, the guardianship of family rights and affections, the prolonged existence of the spirits of the dead. The Sabines maintained these ideas in the greatest purity and simplicity; the Latins seem, from their position on the coast, to have had an earlier connection with the Greeks, some of whose colonies were planted on their soil; and they partook more than their ruder neighbours of the Greek devotion to moral abstractions, such as wisdom, power, and beauty. But they both agreed in the infinite multiplication of their objects of worship. Every city had its guardian divinity; every wood and stream its Genius, its Nymph, or Faun; every family offered a special service to the patron of the house, the deified spirit of its earliest ancestor. The maintenance of this family worship was a solemn obligation descending to the heir of the estate, and in default of natural heirs the practice of adoption was enjoined for its preservation. The cult of the Lares and Penates, the domestic fetishes of the house, seems to have been common, with some variety of usage, to Etruscans, Sabines, and Latins.

The religion of the Sabines and Latins was simple and impulsive; that of the Etruscans philosophical and reflective. The one bowed with submission to the gods, the other inquired into their nature and explored their will. But whatever difference we may trace between them, we find them amalgamated together in the cult of the Roman people, who were placed, as we have seen, at the point where these ideas might first come in contact and coalesce. We shall find the threefold origin of the state marked no less strongly in its political institutions. From Etruria came the division into tribes, curies, and centuries; the array of battle, the ornaments of the magistracy, the laticlave, the prætexta, the apex, the curule chairs, the lictors, the triumphs, and public games, the whole apparatus of the calendar, the sacred character of property, the terminal science, and, in short, the political religion of the state. From Latium the names of prætor and dictator, the institution of the *feciales*; the habits of husbandry and respect for the plough; and, finally, the Latin language itself. From Sabellia were derived the names of military weapons, and of the spear or *guir*, which gave one of its designations to the Roman people. The Roman title of Imperator seems to be a popular application of the Sabine word *em-bratur*. The patriciate and patronship belonged more or less to all the nations which surrounded Rome, and so did the habit of dwelling in cities, and the institution of municipal governments. Such was the case also with the division into *gentes*, clans, or *septs*, and the remarkable extent of authority accorded to the father and the husband. This mixed formation of Roman society is mythically represented to us by the legends which describe the first and third of the kings as Latins, the second and fourth as Sabines, the fifth and two following as Etruscans. But there is probably some historic truth in the claims of the chief families to descent from one or the other people respectively. It is interesting to trace the Julii, the Tullii, the Servilii, the Geganii, the Quinctii, the Curiatii, the Clœlii, to Alba; the Fuii and Hostilii to Medullia; the Coruncanii to Cameria; the Porcii and Manilii to Tusculum, —all in Latium. The Appii, Postumii, Valerii, Marcii, Fabii, Claudii, and Calpurnii were Sabines. The Cillnii and Licinii came from Arretium; the Cæcinæ from Volaterra; the Vettii from Clusium; the Pomponii, Papii, and Coponii from other places in Etruria. (Duruy, *Hist. des Romains*, i. 89.)

Political
History.

SECT. III.—LEGENDS OF THE FIRST FOUR KINGS AND THE
POLITICAL INSTITUTIONS ASCRIBED TO THEM.

The early history of Rome, as written for us by Livy

Political History. and Dionysius, has no claim to be considered as a record of actual facts, and such truths as it really may contain cannot be sifted with any certainty from the mass of fiction with which it is embedded by the science of the historian or the political philosopher. We can only regard it as an attempt to account, under the guise of history, for existing institutions and political phenomena at Rome, at a period when the consciousness of the people was aroused to seek the origin of their own life and being. The primitive legends of the flight of Saturn to Latium, the advent of Hercules, the arrival of Evander, the settlement of Æneas at Alba, are attempts to explain the apparent presence of an Hellenic element in the language and usages of Italy. The story of the birth of Romulus and Remus from Mars and Rhea illustrates the warlike spirit and victorious career of the Roman nation; the suckling of the twins by the wolf, the slaughter of the wicked uncle, the collection of a horde of outlaws, the opening of an asylum for fugitives and robbers, the quarrel of the brothers, the rape of the Sabine women,—all combine to represent the fierce and aggressive spirit of the race of conquerors whose hand was to be against every man, and every man's hand against them. The contest of the Romans and Sabines for the Tarpeian citadel, and the final pacification and alliance between them, soon followed by the accession of the Sabine Numa, the founder of law and religion, indicate a consciousness of the early introduction of a Sabine element into the Roman polity. The wars of Tullus with Alba shadow forth the ancient conquest of territory eastward of the city, and the first extension of the Roman domain beyond the walls of Rome. The establishment of a Sabine colony on the Quirinal, a Latin on the Aventine, an Etruscan on the Cælian, all finally comprehended in a single inclosure, testify the rapid growth of the city by the fusion of the three rival nations at their point of junction. The legends of the death of Remus and the slaughter of Horatia seem to aim at explaining the origin of actual religious ceremonies, and if we knew more of the domestic antiquities of Rome, we might trace perhaps the ideas which gave birth to many other stories, such, for instance, as the treachery of Tarpeia. The murder of Romulus by the Senate typifies a protest of the commons against the violence of the aristocracy, while the accompanying legend of the victim's exaltation into the heavens justifies the hero-worship of the state and of the Gentes. On the other hand, the reign of Numa is evidently painted by the faction of the nobles. Numa is the founder of the rites and institutions of Rome; and these are the charter of the Roman aristocracy. The death of Tullus Hostilius, the third king, is another instance of this class of legends: he is struck with lightning for abusing the legitimate worship of the gods, of which the nobles are the guardians and expounders. Ancus, however, his successor, is the king after the people's heart; his reign is contrasted with that of Tullus, as that of Numa with his predecessors, as an epoch of peace instead of war; but Ancus, unlike Numa, is celebrated for the favour he extended to the lower unprivileged classes, for his courting the breeze of popular applause, and publishing the mysteries of the aristocratic religion; nevertheless he is the founder of the prison under the Tarpeian hill, long known to the citizens as the terror of the oppressed and degraded as well as of the wrong-doer, a chief instrument in maintaining the hateful ascendancy of the oligarchs. (Michelet, *Hist. de Rom.* i.)

The classes opposed to one another throughout political history are the nobles and the commons. The aristocracy and the people are known in the Roman records by the special name of *patricians* and *plebeians*. The first founders of the commonwealth, whether by settlement on vacant soil, or by conquest of a more primitive population, formed

the original body of citizens, with equal rights of dealing of marriage, of suffrage, among themselves. Such were the patricians of Rome. The subjects of this dominant race, whether by original conquest, or by later acquisition, including such as ranged themselves, of their own free will, under the powerful protection of the Roman city, became known by the general name of plebeians (the *plebs*), and were admitted to no share in the government, to no equal rights, social, political, or religious, with the citizens. They remained, according to the significant expression of a Roman patrician, "without auspices, without families, without ancestors." They were distinguished, however, from the slaves of the Roman household, having their personal freedom, property, and liberty to exercise handicraft trades for their own benefit. They were subject also to the military conscription. But such immunities as they enjoyed were secured to them, not by law, but by the protection of the patricians, to whom they stood individually in the relation of clients to patrons. Thus every plebeian was originally the client of a patrician; but as the plebeians gradually acquired legitimate civic rights of their own, the status of the client was transferred to the ever-growing class of subjects who were not citizens at all.

The political institutions ascribed to Romulus must be regarded as affecting the patricians only. This Roman people was formed, we are told, into three tribes,—the *Ramnes*, the *Tities*, and subsequently, but with inferior rights, the *Luceres*. It is conjectured that the first of these represents the original Latin people of the Palatine, the second the Sabines of the Quirinal, the third an Etruscan element in the population, which, according to tradition, was settled on the Cælian hill. Each tribe was subdivided into ten *curiæ*, and these bodies met in general assemblies, or *comitia*, called after their name *curiata*, in which resided the sovereign power of the state deputed by it to a king. The Senate was a body chosen from the curies as a council of state, consisting first of 100 members, soon afterwards doubled by the incorporation of the Sabines; but the Luceres were not originally admitted to a share in this dignity. Each tribe was bound to furnish 1000 men on foot, and 100 to serve on horseback; and this body formed the legion. The horsemen, originally designated *Celeres*, became in course of time a distinct order in the state, under the well-known title of *Equites* or Knights.

As Romulus, the founder of Rome, whose name is connected with the Greek word *βίωμα*, *strength*, was the author of the military institutions which upheld the fabric of the state, so Numa the Sabine, a name which must remind us of the Greek *νέμω* and *νόμος*, *law*, was regarded as the framer of its religious rites, the foundation of law and order. He appointed as the guardians of the national religion four pontiffs, the first of whom was specially designated the Pontifex Maximus; he assigned two Flamens to the special service of the tutelary gods of Rome, Gradivus and Quirinus, and a third to that of Jupiter. He instituted the College of Augurs and of the Sali, who bore on their heads the sacred shields of Mars; and established the priesthood of the sacred Virgin, who tended the never-dying flame on the altar of Vesta, brought from the shrine of the goddess at Alba, the mother city of Rome. Numa is also said to have built the temple of Janus, the double God, whose faces looked both before and after, and to have closed its portals in sign of peace. He appointed also a long series of ceremonial observances connected with the seasons of the Roman year, and first completed the calendar by the addition to it of the two months of January and February. The year of Numa consisted of twelve lunar months and one day over, making 355 days in all. In all these institutions he sought and enjoyed the counsel of the Camœna, or goddess Egeria, a deity of the Sabines, and the grotto

Political History. at which he was wont nightly to meet her, near the *Porta Capena*, continued to be shown at Rome for many ages.

SECT. IV.—THE THREE LATER KINGS.

The three later kings. The first four reigns represent the struggles of Rome with the Sabines and the Latins, and she is described as victorious throughout a succession of wars. The next period bears a different character. Rome is now under the sway of an Etruscan dynasty, and to this epoch are ascribed certain works, still partly existing, which attest more surely than record or tradition the fact of an Etruscan domination on the spot. The chiefs under whom the low grounds of the city were drained by the vast Cloaca, and the national temple erected on the scaped brow of the Tarpeian rock, under whom the Seven Hills, crowned with separate fortifications, were united within one continuous inclosure, were assuredly Etruscans; and they must have exercised their authority with the strong hand of conquerors and despots. The legends, however, say nothing of an Etruscan conquest of Rome. Tarquinius Priscus, or the Elder, is represented as the son of a Grecian refugee who removed from Tarquini in Etruria to Rome, by the advice of his wife, the prophetess Tanaquil. Appointed tutor to the sons of Ancus, he succeeds, on the king's death, in supplanting them on the throne. Rome receives from him her first architectural embellishments—he establishes the circus for national games—constructs the Cloaca, and commences the Capitol. The expense of these great works is supposed to be defrayed, not by the forced labour of a nation of serfs, but by plunder seized from the Latins and Sabines. Tarquin celebrates the first Roman triumph after the Etruscan fashion, in a robe of gold and purple, and his chariot is drawn by four white horses. Many of the ensigns both of war and of civil office are assigned to this epoch. And now we meet with the admission of one hundred plebeians into the Senate, and the formation of three new centuries of knights. The opposition of the patricians to this democratic innovation is signalized in the legend of Attus Navius, the augur, who resists the policy of the sovereign, and confirms his resistance with the sanction of a miracle. A statue of Attus, standing for many centuries in the Forum, attested the stroke of the augur's razor, which cut the stone at Tarquin's bidding.

These attempts at relaxing the stern exclusiveness of the Roman polity were continued, it is said, and effected more triumphantly by the next king. Servius Tullius, described in one account as originally a slave, is said to have married a daughter of Tarquin, and to have gained the throne by the contrivance of Tanaquil. Another, and probably the Etruscan legend, represented him as a soldier of fortune from Etruria, who attached himself to Cæles Vibenna, the founder of an Etruscan city on the Cælian hill. His original name, Mastarna, was changed to that of Servius, by which alone he became known in the native history of Rome. Servius connected the Viminal, the Quirinal, and the Esquiline, the three Sabine hills, with the Palatine, the Tarpeian, now called Capitoline, the Aventine, and the Cælian, thus completing the fated number of seven. The *agger*, or mound, with which he defended this city to the north, may be traced to this day; and some vestiges have been discovered of the massive stone walls which encompassed it in other quarters. He divided the city thus completed into four regions, the Palatine, Suburran, Colline, and Esquiline.

The chief external event of this reign, according to our records, was the formation of an alliance with the thirty cities of Latium, confirmed by the erection of a common temple to Diana on the Aventine. The lands which Servius won from the Veians and Etruscans he divided among the plebeians, thereby incurring the hostility of the patri-

cians towards a foreign dynasty, and especially to the slave-born sovereign himself, the patron of the upstart commonalty. For the policy of Servius was directed to raising the subjects of the state to a political equality with their rulers, and carrying out the liberal views already indicated by his predecessor. His plan, however, was not, we are told, to raise the plebeian families to patrician rank, and introduce them into the special assembly of the curies, but to create a new general assembly, under the name of the *centuries*, which should comprehend both classes alike. The Servian constitution, such as later ages loved to picture it, though confessing that it never really came into practical operation, was the enrolment of the whole body of the citizens, patrician and plebeian, in one great military array, according to their census or means, and the arms which they could bring into the field. Thus enrolled and accounted, they were to assemble in the Field of Mars, outside the city, and decide on all the gravest affairs of state, of peace and war, of laws and ceremonies, with the full powers hitherto enjoyed by the curies alone. But though this division into classes existed only on paper in the histories of a later age, the division of the people into its tribes, from twenty to thirty in number, was an actual fact, whether rightly ascribed to Servius or not. The tribes of Romulus were only three, and were confined to the patricians; those of Servius embraced the great body of the plebeians. The former referred only to birth; the latter defined the habitation of the members belonging to them. Of the Servian tribes, four only were in the city, the rest were assigned to country localities in the domain of the state. The names of most of these tribes, which continued to exist with various additions to a very late period, have been mostly preserved to us; but though they formed the basis of another assembly of the people which played a great part in the subsequent history of Rome, so little interest or importance attaches to them that even their number at this and at later periods is involved in the greatest uncertainty. The legend of Servius brings him to the wonted end of a democratic reformer. Assailed by his own children, the favour of the multitude is unable either to defend or to avenge him. The people can do no more than consecrate his memory in undying tradition, and mark the day of his assassination by a religious ceremony repeated every month. The street in which the abominable Tullia drove her car over her father's body continued ever after to bear the name of "The Accursed."

The reign of the second Tarquin, or the Proud, is an attempt to usurp the power both of the nobles and the commons, and establish a pure despotism on the ruins of the democratic monarchy. Wars are waged with the Latins and Etruscans, but the lower classes are deprived of their arms, and employed in the servile occupation of erecting monuments of regal magnificence, while the tyrant recruits his armies from his own retainers and the forces of foreign allies. The completion of the fortress-temple on the Capitoline confirms his authority over the city of Rome, and a connection by marriage with the dictator of the Tusculans secures him powerful assistance in the field. He reigns with bloodshed and violence, oppressing the poor by his exactions, and crushing the rich by slaughter and proscriptions. The outrage of his son Sextus on the chaste Lucretia at last precipitates a revolt; and L. Junius Brutus, supported by the injured husband and father, proclaims the fall of the foreign dynasty, and the establishment of a republic. The name of Brutus was given in the Latin language to an idiot; and hence arose a legend that the hero of the Regifuge, or flight of the kings, had simulated madness to deceive the Tarquins, in whose house he had been bred. Another conjecture has been hazarded by modern critics, that the term means a slave, especially a revolted or fugitive slave, and indicates in this story the

Political History

A.V. 24
B.C.

Political
History.

insurrection of the commons, oppressed and degraded slaves of the monarchy, against the tyranny of their foreign masters.

But the legend of the Tarquins does not terminate with their fall from power. Banished from the city, they take refuge with their allies at Tarquinii and Veii, and intrigue for the recovery of their throne. While the citizens were organizing their commonwealth, appointing Brutus and Collatinus their first consuls (*prætors* they were originally called), with powers hardly less than regal, but limited to a single year, the emissaries of Tarquin engage the sons of Brutus in a plot to restore him, the execution of whom, when discovered, by their own father's decree, was recorded as a striking instance of the sternness of the ancient patriotism. A second attempt with an army of Veians and Tarquinians was not more successful, though Brutus himself fell in the combat which gave victory to the Romans. Tarquin made a third effort, with the aid of Porsenna, chief of the whole Etruscan confederacy, and this powerful ally penetrated to the Tiber, and would have followed, the flying Romans into the city, but for the courage with which Cocles defended the bridge till it could be broken down behind him. This ancient peril of Rome was illustrated by the popular traditions of Mucius and Cloelia; but though it continued to be confidently believed that the invader was compelled to retreat discomfited, later inquirers professed to have discovered documents proving that the city had in fact capitulated to him, that the Romans had been subjected to Etruscan authority, and forbidden, like the Israelites under the sway of the Philistines, the use of iron even in their domestic implements.

To continue the popular story, however: we next read of Tarquin betaking himself to his allies at Tusculum, of a great Latin confederation for his restoration, and of the battle at the Lake Regillus, in the which the exiles were finally defeated by the assistance of Castor and Pollux, who fought on the side of the Romans, conspicuous on white horses. The Latins make peace with Rome, abandoning Tarquin to his fate; and the old king dies eventually, fourteen years after his expulsion, at the court of the Grecian tyrant of Cumæ.

SECT. V.—REMARKS ON THE FOREGOING ACCOUNTS.

Remarks
on the fore-
going ac-
counts.

The kingly power is said to have been overthrown in the year 244 of the city; the reigns of seven kings having filled up this long interval, the average of the six first, four of which are cut short by violent deaths, being thirty-six years to each. In addition to the startling improbability of such a series of protracted lives, there are other chronological difficulties in the narrative which the ancients themselves tried in vain to remove. In modern times these inconsistencies gave the most powerful, if not the first, incitement to the spirit of historical scepticism which has resulted in an almost entire renunciation of the early Roman records as genuine historical documents.

We shall consider presently, from an examination of the sources of genuine information which were really open to the Romans themselves, what amount of credence may reasonably be given to the reputed facts of their story. In this place it will be sufficient to point out that the so-called history of the kings presents an outline common to the early annals of most states of antiquity, the growth of a commonwealth by war and conquest till its ruler, at the head of a veteran army, and in possession of a central stronghold, sets himself above the laws, and plays the despot with selfish violence, till stricken down by the people whose patience he has outraged. To this kingly period succeeds generally, as at Rome, an epoch of popular government, in which the regal name is detested as the symbol of violence and tyranny, and the supreme power,

which the rudeness of the times requires to be lodged in strong hands, is guarded against abuse by distribution among two or more possessors, with limitation to a single year's tenure; when in cases of emergency this power is still more concentrated in a single hand, the limitation of tenure is reduced just in proportion to six months. From this time, secure of their freedom as against their rulers, the citizens plunge into a series of struggles among themselves, class against class. The second period of Roman history corresponds with the ordinary course of political affairs, and is marked by a long and fluctuating contest between the aristocratic and democratic elements of a republic. The verisimilitude of the general outline commands our attention and respect; but we must still hold ourselves fully on our guard against giving credence to the details, confused, contradictory, romantic, and repeated with little variation over and over again, with which it is set forth and enlivened.

Political
History.

SECT. VI.—BEGINNINGS OF THE REPUBLIC.

The first circumstance which strikes us in the received account of the beginnings of the republic is, that the victory of the people over their tyrants turns to the advantage of the aristocracy only. We hear no more of the popular constitution of Servius. The patricians are masters of the Senate and of the *curies*; while by their wealth and the number of their clients, they retain the chief influence in the centuries, and as expounders of the state religion, hold in their hands the most potent instrument of political warfare.

The struggle, however, which soon ensues between the patricians and plebeians is no longer represented as arraying two races or castes against one another: Rome has entered upon a second phase of political existence; the rich proprietors are struggling to maintain their ascendancy over the poorer classes. The patrician generally represents the man of family and civic honours, residing in the city, but owner of domains in the territory of the state; the plebeians, the small farmers and petty tradesmen, and those who made their living by their own thrift and industry. The patrician had also secured to his own exclusive use the public lands, the ownership of which the state reserved to itself. At this time, indeed, if we may follow the traces of the accredited history, these conquered domains had shrank to very small dimensions, for the limits of the Roman state, as well as its external relations and influence, appear after the Regifuge in very circumscribed proportions.

But the struggle between these classes is dated back to the very first year of the commonwealth. One of the two consuls is represented as a plebeian. Valerius Poplicola, the first champion of the popular order, is supposed to have acquired his name by the zeal with which he maintained its claims. In the same spirit of mythical history, Poplicola is said to have opened to the plebeians the competition for the consulship, and proclaimed the penalty of death against any aspirant to the tyranny. Poplicola requires the consuls to lower their fasces, the rods and axes borne before them by the lictors, in the assembly of the people. Within the city, indeed, the axe is to be removed altogether, to show that the regal power of life and death over the citizens is withdrawn at home, and only exercised in the camp abroad. But these restrictions on the outward show of power have no effect in controlling the substantial preponderance of the patricians, who for many years together held exclusive occupation of the consulship, who, whenever their prerogatives are threatened by popular impatience, create a dictator with absolute authority for its repression, and who forbid any amalgamation of the two orders by intermarriage.

It is in the nature of things that men should long bear

Political
History.

with social inequalities and political disabilities, and the history of the republic corresponds with ordinary experience when it relates that the first struggle of the two orders was caused, not by a sense of abstract inferiority on the part of the plebeians, but by the pressure of poverty, and a tyrannical law of creditor and debtor. The decline of the power of the republic would imply a very general impoverishment of the citizens, and the wealthiest would be likely to turn the hardness of the times to their own advantage. The poor would need ready money to supply themselves with arms, as well as to till their land and pay their taxes; the rich would lend to them at exorbitant rates of interest, and on their failing to repay, would indemnify themselves by seizing the debtor's person and reducing him, or his children in lieu of him, to slavery. We are assured, indeed, that the Roman law allowed the creditor to kill his insolvent debtor, or if there were several creditors, to cut his body in as many pieces. Harassed by cruel exactions and still more cruel punishments, the plebeians at last refused to enlist in the annual campaign against the Latins. They had discovered the weak point in the patrician armour. It was necessary to suspend the severity of the law for the moment, with a promise to alter it at the conclusion of the war. But the popular consul Servilius, who made this concession, was denied the triumph he had earned by the hands of the plebeians, and the patricians relapsed again into their old tyranny.

Secession
of the
plebeians
to the Mons
Sacer,
A. U. 260,
B. C. 494.

Not once or twice only are the plebeians and their generous champions among the nobles thus cajoled and disappointed. At last the plebeians, choosing themselves generals, one of them a Brutus, and renouncing the authority of the consuls, march forth under arms to the hill on the junction of the Tiber and Anio, two miles from Rome. Here they resolve to settle and form a new city. The patricians deliberate, and under the hot counsels of their haughtiest advisers, are almost prepared to accept this defiance, and allow Rome to be split asunder. But this peril was averted by the prudence of more moderate leaders; and the sedition was appeased, according to the legend, by the skilful eloquence of Menenius Agrippa, who related his apologue of the belly and the members. The seceders required a substantial guarantee for their future security; and thus, we may believe, was the origin of an institution destined to become one of the chief elements in the Roman polity, the Tribune of the Plebs. The citizens were authorized to nominate two tribunes annually, who should have a veto on the decrees of the Senate, and protect the personal liberty of the commons. Their own persons were to be inviolable; and that they might be always at hand to defend their constituents, they must never leave the city for a day; their houses were to be open day and night to receive every application for assistance. It is remarkable that the election was given in the first instance to the centuries, among which the patricians continued, through their clients, to enjoy a large measure of authority. The number of the tribunes was afterwards increased to ten, and as any one of them could interfere to prevent the action of all the others, it became the easier for the Senate to divide and paralyse its opponents. But the election had previously been transferred to the assembly of the tribes, which were more independent than the centuries of patrician influence.

Origin of
the tribu-
nate.

We may remark in the institution of the tribunate the fatal vice of the Roman polity, which sought to create a permanent balance of powers by arraying the different orders of the commonwealth in precisely equal force against each other, instead of combining them together, with joint interests and privileges. If, instead of playing off the tribunes against the consuls, it had secured an equal share in the consulships and the Senate to both patricians and plebeians, it might have effected a harmonious co-opera-

tion between parties which were henceforth ranged in constant strife and jealousy one against the other. As it was, the struggle between the two parties continues, according to our accounts, to rage more violently than ever. The first victory is on the side of the plebeians. C. Mar- Coriolanus, cius, a brave patrician, who has acquired the surname of A. U. 266, Coriolanus, from the capture of the Volscian town Corioli, falls a victim to the jealousy of the people. His haughty bearing had given offence to the multitude; they find means of urging unjust or invidious charges against him; they require him to defend himself before the assembly of the tribes, in which the power of the plebs predominates, and drive him into exile. He returns at the head of the Volscian armies which he has so lately defeated, routs the Roman legions, and prepares to lay siege to his native city. Heralds, magistrates, priests, are sent out successively to sue for peace; but he remains inexorable, requiring humiliating terms of concession to his new allies. At last his wife and mother present themselves, with the Roman matrons, in his camp; to them he yields, and withdraws his troops from the attack, assuring them, at the same time, that in sparing the city he has forfeited his own life. The legend closes appropriately, in one account, with the statement that his foreign friends turn in anger upon him and slay him; another story represents him, less poetically, as surviving still in exile to an old age.

Political
History.

It is needless to point out the marks of poetical invention in this famous narrative. As a tradition of the power and the deadly jealousy of the commons, it was to be paralleled by a rival story from the opposite quarter. Spurius Cassius, a patrician, and three times consul, resolved to become the benefactor of the plebeians. He proposed an agrarian law, —that is, a division of the public domains among the poorer citizens, or at least a common right with the patricians, who now usurped the occupation of it, a constant source of dispute from this time forth, as will be hereafter explained, between the two classes. The authority of the proposer was sufficient to carry this law; but the patricians contrived to thwart its operation, while they watched an opportunity of avenging themselves upon him. He was accused, as soon as his consulship expired, of granting too favourable terms to the national enemies, and of seeking to make himself tyrant of his native city. He was tried, found guilty, and condemned to the traitor's death by scourging and beheading.

Spurius
Cassius,
A. U. 269,
B. C. 485.

The wars of Coriolanus and Spurius Cassius against the Volscians and Hernicans, two Sabine tribes who lay to the eastward of the Latins, indicate an extension of the area of military operations. Partly through their league with the Latins, partly also from the increase of strength gained to the republic by concession to the plebeians, the Romans are advancing again in the career of conquest. The campaigns of the following years are directed against the Volscians, the Æquians, and the Veientes; but the progress of victory is still checked from time to time by the refusal of the plebeians to serve until an agrarian law is not only carried but executed. The contest of the classes is not now for a relief from debts, or for an equalization of political rights, but for admission to a common right of property in the public land. If we could accept an hypothesis of Niebuhr, the transplantation of the Fabii, a numerous and old patrician house, to Cremera, where they were all slain by the Veientes, might be added to the incidents of the agrarian feud; for that historian supposes them to have migrated from mortification at failing, notwithstanding their high character, and their seven successive consulships, to bring about the passing of a modified law of property. But our authorities at least know nothing of any such tradition; and the whole affair is far too uncertain, as a matter of history, to bear the weight of any conjecture of the kind.

Political
History.

Genucius,
A U. 286,
B C 468.

But soon after the reported date of this event follows another attempt at effecting an agrarian settlement by a tribune named Genucius, accompanied by an impeachment of the consuls for frustrating the operation of the law. Against this attack another method of defence is adopted. Genucius is suddenly found dead in his bed; and from this account we infer the popular belief that he was murdered privily by the opposite party. After some further manoeuvres, a compromise is at last effected, by the settlement of a plebeian colony on the conquered lands of Antium.

SECT. VII.—HISTORY AND LEGISLATION OF THE
DECENVIRS.

History
and legis-
lation of
the decem-
virs

We have remarked already that there is much of a poetical, much of what may be called a conventional, character in the history of the kings; and the same features continue strikingly to pervade the records of the early period of the republic. To some extent, indeed, these latter accounts present superior marks of authenticity, in the regular recurrence of family names, wholly wanting in the former, and in the frequent mention of such domestic occurrences as pestilences and portents. These incidents seem to show that the families and the priests pretended at least to possess some private registers of the events most interesting to them; the first indeed may be mere fabrications of a later date, but the others are not apparently of a character to be deliberately forged. It may be added that there certainly existed, at a much later epoch, some monuments of early history, though we cannot vouch for their genuineness; such as the brazen plates on which were engraved the treaties made by Rome with Porsenna, and also with the Hernicans. Polybius knew of a third, which recorded a treaty between Rome and Carthage, in the first year of the republic. However we may suspect, from considerations hereafter to be offered, the genuineness of these documents, it is right to mark the first signs on the part of our authorities of a reference to historic testimony.

Such meagre incidental notices say little, however, for the authenticity of our details of foreign wars or domestic revolutions, and the minute accounts we have received on these subjects should only serve to put us more on our guard. Some remarks of Sir G. C. Lewis may put in a clear light the grounds of our suspicion:—

"It is a peculiarity of the constitutional history of Rome, as it is related to us, that after an agitation of some years for one demand of the popular party, another demand succeeds, without any apparent redress of the former grievance, or any distinct explanation of the reason why one claim is abandoned and another takes its place. The first grievance of the plebeians is the law of debt, which produces the first secession; but Livy and Cicero both describe this movement as leading only to the establishment of the tribunate, and not to a remission of debts, or to an alteration of the law of insolvency. Yet from this time the complaints about the law of debt cease, and the agrarian movement takes place. Both historians represent the patricians as making a successful stand against a division of public land among the plebeians, until the sending of a colony to Antium in 467 B.C.; nevertheless, from this year the agrarian question falls into the background, and another subject steps into the most prominent place. Livy and Dionysius, indeed, differ as to the course of the agrarian agitation; for whereas the former conceives the tribunes as proposing a series of laws, all of which are successfully resisted by the patricians, the latter states that the Senate in the year of Cassius passed a general measure for the division of the public lands, but that the successive consuls would never carry it into effect; that a solemn compact made between

the Senate and the plebs was broken; and that the efforts of the tribunes were directed exclusively towards procuring the execution of the unexecuted decree. In the practical result, however, that the division of the public lands was averted by the patricians, they concur." (*On the Credibility of Early Roman History*, ii. 165.)

Such, then, being the close of this series of agrarian discussions, the old questions suddenly fall into abeyance, and are superseded by a third. The tribune Terentillus Arsa demands a code of written laws. We are told that during the monarchy the kings were the supreme dispensers of justice, and acted therein at their own caprice or discretion; that the consuls succeeded to this along with the other kingly prerogatives; and that accordingly up to this time there was not only no written code of law and procedure, but that no gradual accumulation of precedents had settled into a definite system of acknowledged usage. The Romans had to begin their law-making from the beginning, and with this view the demand of the plebeians soon shaped itself into a proposition for sending commissioners to Athens to bring home the laws of that state, and make them the basis of the new code of the republic. The demand, indeed, of Terentillus was resisted and evaded, and it was not till the year 300 that such commissioners, three in number, were actually despatched to Greece. In the meantime, we may notice one exception to the remark just made in the agrarian law of the tribune Icilius (A U. 298) for assigning lands on the Aventine to the plebeians. This interval contains also some other events of interest: the surprise of the Capitol by Herdonius the Sabine, with a troop of slaves and Roman exiles, implying the continuance of mutual violence between parties of the state, and the repeated banishment of their leaders; again, the campaigns of the republic against the Æquians and Volscians, in the course of which the brave and frugal Cincinnatus was taken from the plough and made dictator, according to a romantic legend, to lead the forces of the state against the foreign enemy.

On the return of the commissioners in the year 303, so The decem-
runs the story, it was resolved to appoint a board of ten, virs,
called decemvirs, to arrange the Roman laws. The patri- A U. 303,
cians insisted that all these officers should be chosen from B.C. 451.
their own order, and having gained this point, required both the consuls and tribunes to abdicate their functions, and leave them free scope for conceiving and enacting their measures. The decemvirs accordingly were not legislators only, but the rulers of the state; and they were too well satisfied with the prerogatives they wielded under their extraordinary commission to acquiesce in the prospect of resigning them. They procured the prolongation of their office for a second and again for a third year; and it was not till the year 305 that, in pursuance of a course of arbitrary violence and license, Appius Claudius, the most Appius
tyrannical and selfish of the number, provoked the people Claudius
to rise in indignation and abrogate it by an abrupt revolu- and Vir-
tion. The story of the lust and cruelty of Appius, the ginia,
peril, under a colourable procedure of law, of the fair Vir- A.U. 305,
gimia's honour, which her father could only preserve to her B.C. 449.
by stabbing her to the heart in his despair, is one of the most striking of the poetical legends of Rome, the more deserving of attention as it is accompanied by none of the supernatural incidents which usually throw suspicion on its stories of valour, patriotism, and self-devotion. Nevertheless the incident is related with a circumstantial minuteness which alone seems to warrant us in rejecting it as a true narrative; and indeed the discrepancies and improbabilities which surround the whole account of the decemvirate render its history extremely questionable both in substance and in details.

The fragments remaining to us of what the later Romans themselves regarded as the genuine laws of the Twelve

Political History.

Question of the credibility of the received accounts.

Tables are exceedingly slender. Dr Arnold thus describes their purport (*Hist. of Rome*, i, 291):—"1. That there should be an appeal to the people from the sentence of every magistrate; 2. That all capital trials should be conducted before the comitia of the centuries; 3. That *privilegia*, or acts of pains and penalties against an individual should be unlawful; 4. That the last decision of the people should supersede all former decisions on the same subject; 5. That the debtor whose person and property were pledged to his creditors *nexus*, and he who remained the free master of both, *solutus*, should be equal in the sight of the law; that is, that the *nexus* should not be considered as *infamis*. . . . A sixth enactment is expressly ascribed to the last two tables, which Cicero describes as full of unequal laws (these were a later addition to the first ten, and were considered more harsh and unjust to the people), namely, that between the burghers and the commons there should be no legal marriages; if a burgher married the daughter of a plebeian, his children should follow the mother's condition, and were not subject to their father, nor could inherit from him if he died intestate." Upon which the same author further remarks,—“With no further knowledge than of these mere fragments, we can judge but little of the tenor of the whole law; but yet, if we had the entire text of the twelve tables before us, we should probably find in them no direct mention of the great constitutional changes which the decemvirs are with reason supposed to have effected. Their code of laws was the expression of their legislative rather than of their constituent power; it contained the rules hereafter to be observed by the Roman people, but would not notice those organic changes by which the very composition, so to speak, of the people itself, was so greatly altered.”

These are the remarks of a writer who is deeply imbued with a persuasion of the fundamental authenticity of the history of this and of much earlier times; but to others the pretended legislation of the decemvirs seems hardly less apocryphal than the narrative by which it is accompanied. The fall of these tyrants was followed, we are assured, by a strong popular re-action; so much so, that the new consuls, bearing, it may be observed, the mythical names of Valerius and Horatius, are enabled to restore the tribunate, increased in number to ten; to rehabilitate the comitia of the tribes, degraded by the laws of the decemvirs; to secure for the decrees of this assembly (*plebiscita*) a force binding on all the orders of the state; and yet the prohibition of intermarriage, the most galling mark of class inferiority, is not only suffered to remain, but is even published by them as the last legacy of the tyrants, and remains as a brand upon the face of the plebeian order for many years to come. “The decemviral legislation,” says a bold but candid inquirer of more recent date, “was, as we have seen, a measure which originated with the plebeians; but it was turned to their oppression, and was overthrown by their resistance. It was intended to remove the inequalities between the two orders, but it seems to have added to them. The decemviral government having sprung out of the demands of the plebs, is put down by a plebeian secession; an extreme measure, and only one degree short of insurrection or civil war. When the plebs return, they appear to be able to dictate their own terms; the consuls chosen are devoted to their interest, and introduce important legislative measures of a popular character. The only real equalization of rights effected at this time is that which follows the decemviral legislation; the twelve tables themselves did nothing for effacing the privileges of the patricians and the disabilities of the plebeians. . . . The description of the outburst of plebeian power, of the fears of the patricians lest they should be made the subjects of vindictive impeachment, . . . renders it quite unintelligible why the laws of the two tables prohibiting marriages be-

tween patricians and plebeians should have been passed after the fall of the decemvirs, or if it had been enacted by the decemvirs, why it should not at this moment have been repealed.” (Lewis, *On the Credibility of Roman History*, ii, 253.)

Nor, it may be added, looking again at the reputed legislation of the decemvirs, can we conceive why it should have been necessary to resort to Greece and Athens for principles of law which issued in a series of enactments of so local and national a colour. The matters upon which the decemvirs are supposed to decide are precisely those which have been ever in debate between the two orders of the Roman people, and their methods of solution are the same which have been already ventilated and discussed, according to our authorities, in its assemblies. We shall have occasion to notice hereafter how gratuitously the first writers of Roman history sought to establish a connection between primitive Rome and the more cultivated world of Greece; and there seems much reason to believe that this pretended commission to the land of Solon was a pure invention either of Grecian vanity or of Italian admiration. An attempt indeed is made by some modern critics to establish a distinction between the military and political history, such as we have received them, of early Rome. “While the sceptical conclusions of Sir G. C. Lewis,” says Dr Liddell, “may be conceded in full for almost all the wars and foreign transactions of early times, we must yet claim attention for the civil history of Rome in the first ages of the republic. There is about it a consistency of progress, and a clearness of intelligence, that would make its fabrication more wonderful than its transmission in a half-traditionary form. When tradition rests solely on memory, it is fleeting and uncertain; but when it is connected with customs, laws, and institutions, such as those of which Rome was justly proud, and to which the ruling party clung with desperate tenacity, its evidence must doubtless be carefully sifted and duly estimated, but ought not altogether to be set aside.” (Liddell's *History of Rome*, Preface.) The same distinction had been previously drawn by Niebuhr and Arnold, and made the ground for an inferential re-construction of Roman history, after the rejection of a large proportion of its details. We have indicated in the preceding paragraph the nature of Sir G. C. Lewis's argument to show that the pretended records of constitutional progress of the republic bear the same marks of confusion and invention as those of her external career. The people who elaborated the wonderful system of Roman jurisprudence had no doubt a peculiar instinct for investigating the causes and origin of their political institutions; and they naturally demanded from their annalists a solution of the phenomena of political usage not less urgently than an account of their families and their conquests. In the entire absence, as we shall presently see, of all authentic history or genuine tradition upon both these subjects, they were perhaps as prone to throw themselves upon pure invention for the one as for the other.

SECT. VIII.—THE GAULS AT ROME.

We shall content ourselves accordingly with passing as The Gauls lightly over the political as the military history of the years at Rome. next ensuing. On the one hand we may observe, the patricians are represented as strengthening themselves by the establishment of the office of censors, two magistrates appointed at intervals of five years to hold a census of property and population, to revise the roll of the knights and senators, and determine the civil status of every member of the commonwealth. These arbiters of rank and privilege were to be patricians only. On the other hand, we read that the tribune Canuleius obtained a law for removing the disabilities which attached to marriage between the

two classes. At this period commenced the practice, which continued for a series of years, of appointing military tribunes, six in number, in the place of the two consuls. According to some accounts, this was a contrivance for evading the necessity of opening the consulship to plebeians; other authorities alleged that it was demanded by the multiplication of wars in which the commonwealth was now constantly engaged. In the year 315 (B.C. 439) Cincinnatus was created dictator a second time to quell a fresh sedition of the commons; and his master of the horse, or second in command, Servilius Ahala, performed the notable exploit of cutting down the demagogue Spurius Mælius, accused of aspiring to the tyranny. Thirty years later, the plebeians are said to have forced themselves into the quæstorship, the first of the curule magistracies, the lowest step in the career of honours, through which the candidate for the consul's chair was ordinarily required to pass. Humble as this privilege was, it is said to have been regarded by them as a great prize, inasmuch as it opened the way to the long-coveted eminence—the command of armies, and the glories of a triumph. Meanwhile the wars of Rome were waged, for the most part, as before, with the Volscians, the Æquans, and the Veientes, with a general success only occasionally chequered by defeat, but brought no apparent extension of her frontiers. The final conquest of Veii in the year 358, after a ten years' siege, by the great Camillus, attended by many circumstances which bespeak a legendary origin, was speedily followed by the first authentic event in Roman history, the capture and burning of the city by the Gauls.

While the victorious Romans were pressing upon the declining power of the Etruscans in the south, the advance of the Gauls of the great Cisalpine plain had harassed them in the opposite quarter. Two centuries had elapsed since the barrier of the Alps had been burst by a great Celtic immigration, and the valley of the Po, once the seat of numerous Etruscan colonies, had been overrun and occupied by the northern barbarians. The Senones, the vanguard of the Gaulish invasion, had penetrated to the banks of the Æsis and the coast of the Adriatic, and had threatened for more than a century to take advantage of the increasing weakness of Etruria, and descend upon the smiling valleys of lower Italy. At last 30,000 warriors of this tribe, having threaded the passes of the Apennines, appeared before the walls of Clusium, and demanded an assignment of lands. The Clusians implored the intervention of Rome,—such it seems was the authority of the warlike republic at 150 miles from its frontiers,—and the Senate dispatched, not a military force, but three distinguished envoys, to require the intruders to desist from their attack. But when the Gauls refused to hearken to these demands, the envoys, not content with delivering their message in the character of ambassadors, violated the law of nations by actively joining the Clusians in the defence of their territory. The barbarians indignantly broke up their leaguer, and poured the full tide of invasion down the valley of the Tiber. The Feciales or heralds, as interpreters of international law, urged that the treacherous envoys should be surrendered in expiation of the national sin; but the influence of the illustrious Fabian house, to which the culprits belonged, prevailed to protect them, and engaged the people to repel the assailants by force. The armed militia of the city sallied forth to the encounter; but on the banks of the Allia, eleven miles from the gates of Rome, was routed with bloody and disastrous defeat. So completely was the strength of the republic broken by this single overthrow that it was impossible even to defend the walls. The flower of the citizens threw themselves into the Capitol, but the mass of the population, remaining below, was exposed to the fury of the barbarians; and while the priests and vestals carried off the sacred images to the friendly city of Cære in

Etruria, an hundred aged senators, who refused to leave the city in whose service they had grown gray, were murdered in the Forum or in their houses. Rome was given up to pillage and conflagration.

This terrible catastrophe followed quickly upon the exile of Camillus, whom the people in their ingratitude had accused of various misdemeanours, and who, in quitting the city, had imprecated a curse upon it. Camillus had retired to Ardea, and now watched his opportunity to relieve the state on which the gods had so signally avenged him. The fugitives from the Allia and those from the city had rallied at Veii; and, re-assured by some successful skirmishes, they invited Camillus to put himself at their head, and assume the office of dictator. To confirm this appointment the consent of the Senate and curies was required; so punctually did even the legends of Rome respect the claims of constitutional usage. A young plebeian, Pontius Cominius, undertook to communicate with them, and scaled the rock of the Capitoline unperceived by the enemy. The Gauls, hitherto unable to find an access to the summit, tracked his footsteps, and surprised the garrison by night. The defenders were sleeping securely; even the dogs were lulled in slumber; but the geese, sacred to Juno, clamoured at the noise, awoke the guards just in time; and Manlius distinguished himself above the rest by the vigour with which he repelled the assailants, and hurled them from the Capitols ramparts. The Romans, however, in their impregnable fortress were suffering from scarcity. Camillus delayed to appear; they were compelled to treat with the Gauls, who on their part were anxious to withdraw for the defence of their own country against an attack of the Veneti. It was agreed that the invaders should withdraw with 1000 lb. of gold as the ransom of Rome. When this sum was being weighed out, the barbarians were detected in using false weights; but when the Romans remonstrated, Brennus the Gaulish chief cast his sword into the scale against them, exclaiming, "Woe to the vanquished!" But this insolence met its due reward. Camillus, having at last collected and trained his forces, attacked the foe on his route homeward, routed him with great slaughter, and recovered the ransom of the city. The people, he declared, had had no right to pay it without the consent of the dictator. The sum thus restored was placed in the vaults of the Capitol, to be there preserved as a sacred deposit, and never expended except in repelling a future invasion of the Gauls. Such an occasion never again presented itself, but the treasure, it was said, was centuries later rifled by the man who conquered their country, and made invasion for ever impossible.

From first to last poetical justice is satisfied on all sides. The story of the capture of the city is the most perfect in all its parts of the poetical rhapsodies in Roman story. Yet that the legend has a groundwork of actual truth, there can be no reasonable doubt. That Rome was once sacked by a sudden irruption of Gauls from beyond the Apennines, must be regarded as proved by an authentic tradition. The manner in which the city was rebuilt, so hastily and inconsiderately, that the lines of the new streets often crossed the sewers of more ancient construction, was a visible proof of this event to a later generation. To modern criticism it is attested by the evident loss of almost every monument of history and antiquity beyond this date. No such catastrophe occurred again, and accordingly we seem at this period to get hold at last of the extreme link of the chain of genuine tradition; and though we shall find reason still, for at least another century, to question much of the details of the history, we may believe that the main foundation of events, of names, and of dates, is preserved continuously from henceforth through accredited records, whether public or private. Camillus, the second founder, as he was gratefully entitled, of the city, was in fact the original founder of historic Rome.

SECT. IX.—UNION OF THE TWO ORDERS BY THE LICINIAN
AND PUBLILIAN LAWS.

Union of
the two
orders by
the Licin-
ian and
Publian
laws.

"Yet still," says Arnold, "no period of Roman history since the first institution of the tribunes of the commons is really more obscure than the thirty years immediately following the retreat of the Gauls. And the reason of this is, that when there are no contemporary historians, the mere existence of public documents affords no security for the preservation of a real knowledge of men and actions. The documents may exist, but they give no evidence; they are neglected or corrupted at pleasure by poets and panegyrists; and a fictitious story gains firm possession of the public mind, because there is no one to take the pains of promulgating the truth. And thus it has happened that the panegyrists of Camillus and of the other great patrician families, finding ready belief in many instances from national vanity, have so disguised the real course of events that at no other period of Roman history is it more difficult to restore it."¹

To attempt any such restoration, even did it appear feasible, would not be within the scope of this sketch of history. It will be sufficient to make a passing reference to a few striking incidents recorded, all of which have probably a foundation in truth, though disguised no doubt, and encumbered by many fictitious adjuncts. On the retreat of the Gauls, the Roman people entertained, it is said, the thought of abandoning their ruined homes, and migrating in a body to Veii. Camillus in vain conjured them not to desert the soil of their ancestors, but a passing omen, the voice of a centurion exclaiming "Plant the standard here, here we had best remain," determined them to stay. We can easily believe that the losses of this Gallic war were the occasion of an addition of four new tribes to the city, comprising the free inhabitants of the lands taken from the Veientes. The state was invigorated by this increase in its numbers, and enabled to prosecute a fresh series of campaigns with the Volscians and Æquians, as well as with the Gauls, who, notwithstanding their alleged retreat homewards, and the disastrous defeat which is said to have attended it, appear to have settled themselves in fixed habitations at Tibur on the Anio, and other stations on the Sabine frontier. To this period, and to this continued struggle with the northern barbarians, are referred some of the most romantic incidents of Roman story,—the winning of the golden collar by Manlius, and the aid vouchsafed by a heaven-sent crow to Valerius. Such were the pretended facts by which the family panegyrists explained the names of the Torquati and the Corvini, houses largely celebrated in the later history of the republic.

Manlius
Torquatus.
Valerius
Corvus.

As, however, the external history is now little else than a repetition of such border contests as have been related more than once before, so the internal history presents us with a new edition of the old quarrels between the debtors and their patrician creditors, of the struggles for political equality between the rival classes, and for the establishment of an agrarian law. With respect to the first, the story still runs in its old channel. The people repine at the sufferings of their brave but impoverished veterans, and demand redress for the present and security for the future. On the one side murmurs and sedition, on the other the creation of a dictator. The gallant Manlius throws himself into the popular cause; he is accused of treason; the people are induced to repudiate his championship; and he is cast as a traitor from the Tarpeian rock. The house on the Capitoline, presented to him for his brave defence of the temple against the Gauls, is razed to the ground, and the Manlian gens forbidden from henceforth to use the præ-

Death of
Manlius,

nomen of Marcus. The next domestic occurrence is the carrying of an agrarian law by the tribunes Licinius and Sextius in 377, by which it is provided that no citizen shall hold more than 500 jugera (about 320 acres) of the public land, nor feed on the public pastures beyond a certain number of cattle. Finally, in the same year, the plebs achieves the great charter of its liberties, in the decree that one of the consuls shall be always a plebeian. Such an enactment supposes, of course, the revival of the consulship on its old footing; nevertheless the Fasti continue for several years to insert the names, not of consuls, but of military tribunes; and it is not till 388 that a plebeian consul is at last appointed in the person of Sextius himself. Our account of the way in which this change was effected is characteristic of the strain of domestic romance which forms the basis of so large a portion of our early history.

Political
History.
Agrarian
laws of Li-
cinius and
Sextius,
A. U. 377,
B. C. 377.

Q. Fabius Ambustus, a patrician of high rank, had married his two daughters, the one to Sulpicius a patrician, the other to the plebeian tribune Licinius. Visiting one day at her sister's house, the wife of Licinius was surprised at the formal ceremony with which a lictor knocked at the door of Sulpicius, who was then consular tribune. The consort of the privileged noble laughed at the ignorance of the plebeian's wife, who complained with tears to her husband and her father, and engaged them to combine in effecting a reform which should place her on a level with her haughty sister. Modern critics gravely assure us that this story must be a fiction, inasmuch as the plebeian's wife was daughter of a man who had been consular tribune not long before; and Licinius himself, though a plebeian, was as competent to hold the office and enjoy the services of the lictors as any patrician. If we felt that we were here upon historical ground, we should not regard this as any presumption against the truth of the story. The young wife may have been as inexperienced as a child. But the legend was never intended to challenge criticism.

We may conjecture that the interminable repetitions of similar phases of the great constitutional conflict,—the same complaints, the same concessions, the same evasions, the same reprisals,—have arisen from an attempt to reconcile the claims of various illustrious houses, some to having proposed popular measures, others to having baffled them; thus spreading over various epochs, and dividing among many individuals, the incidents of a political warfare really limited in duration, and confined to a few prominent actors. M. Michelet has pointed out a curious coincidence which may be thought to have some significance, in the repetition of the same names, as connected with these struggles. Thus a Brutus, a Valerius, and a Horatius, are more than once at hand whenever a popular movement requires a patron. A Spurius Cassius, a Spurius Mælius, and a Spurius Metilius, are all alike noble sufferers in the cause of plebeian independence. If the well-known later meaning of the word *Spurius* belong to it properly and originally, the name may have been applied by patrician annalists to those false aristocrats who betrayed the interests of their own faction; if, on the other hand, we assume its derivation from *super*, implying true greatness and nobility, we may ascribe its recurrence to the invention of the plebeians themselves in their zeal for the glorification of such unexpected champions. A son of Camillus, the first who held the office of prætor, created by the dictator as a compromise between the two classes, is also known by the præ-nomen of Spurius. The same is given also to Servilius Ahala, one of the most noted champions of the aristocracy; from whence we should the more readily infer that in all these cases it was alike applied in token of admiration by

¹ Arnold, *History of Rome*, ii. 2.

Political
History.

the partizans of the person so designated. It is remarkable that this prænomen, so common throughout the period of these domestic struggles, occurs but rarely either before or after it. But whatever may be our scepticism regarding the early conflict of two classes, we may reasonably accept the date at which we have now arrived as the epoch of their actual union. The Temple of Concord, dedicated on this occasion by the aged Camillus beneath the slope of the Capitoline, constituted a visible record of the fact, of which some remains are still existing. During the next thirty years indeed the contest still continued fitfully; the patricians yielding step by step with reluctance, the plebeians pressing their advantage. It terminated, however, with the appointment of a plebeian dictator, Publius Philo, in 415, who carried enactments,—1. For enforcing the obligation of the plebiscita on the whole nation; and 2. For allowing both consuls to be plebeians as well as the prætors, and requiring the appointment of one of the censors from each class.

The Publi-
lian laws,
A.U. 415,
B.C. 339.

A period of warfare with the Etruscans and some of the Latin tribes still accompanies this protracted struggle; but the Romans are strengthened by the conciliation of the commons, and the alleged addition of two new tribes seems to show an increase of numbers, probably from the submission and incorporation of foreigners. The Latin states, which had long since violated their ancient treaty with Rome, now seek to renew it; but Rome chooses rather to subdue her faithless allies than accept their alliance on terms of equality. The "great Latin war," as the historians have entitled it, is rendered illustrious by its legends of the military execution of T. Manlius by his father, and of the self-devotion of Decius Mus. The result of the war is the complete and final reduction of Latium. "Three years," says Dr Arnold, "were sufficient to finish for ever the most important war in which Rome was at any time engaged."

SECT. X.—THE SAMNITE WARS, AND CONQUEST OF CENTRAL ITALY.

The Sam-
nite wars,
and con-
quest of
central
Italy.

Roman history now enters upon a wider field. A branch of the great Sabellian nation, the inhabitants of the mountain tracts of central Italy, having extended their conquests far into the south, have made themselves masters of the Etruscan colonies in Campania. The Samnites are established in Capua, Nola, Cumæ, and other cities, and have here assumed the name of Campanians, from the country to which they have succeeded. Their influence extends throughout the Greek cities of the coast, Neapolis and Palæopolis, Stabizæ and Herculaneum; with the old name of Samnites they have lost their ancient language and national associations; and this offshoot from the parent race now finds itself arrayed in war against other branches of the same original stock, the Samnites of the mountains. The Campanians, as the weaker and less warlike of these nations may now be called, solicited the assistance of Rome against the attack of their hardier kinsmen, and offered to surrender their city to the republic as the price of her powerful protection.

A.U. 411,
B.C. 343.

Dawn of
genuine
history.

We have now reached the dawn of genuine history, and the narrative of events recorded by the historians assumes a new complexion. We lose sight from henceforth of the train of marvellous and romantic stories which imparted a seductive charm to our earlier records; but in return we obtain a glimpse at least of political combinations and strategic manœuvres which throws an air of truthfulness over the narrative that follows. Family pride indeed may have

coloured some of the details and suppressed others; but we have got beyond the era of mere fabrication. The Roman history is at least simply told from Roman sources and its very meagreness and obscurity may be accepted as a token of its substantial genuineness. Yet this was the period when the Romans first came in actual contact with the Greeks, the most curious and diligent of historical inquirers, who might have taught them to understand and describe events with greater spirit and precision. A Greek writer assures us that at this era the Romans sent an embassy, along with the Etruscans, to the great Alexander of Macedon.¹ Another Alexander, King of Epirus, had landed about the same time on the coast of Lucania, and defeated a Samnite army in the neighbourhood of Pæstum. The Romans hastened to form an alliance with this new comer, in the year 423 (B.C. 331). But from this alliance with one Grecian power they were soon led into hostilities against others. They engaged in war with the Greek cities of Neapolis and Palæopolis, inadequately protected by their dependence on the Campanians; but their means, perhaps, for reducing places defended and fortified by the rules of art were slender, and the war was protracted through more than one campaign. The Roman armies had now for the first time advanced so far from the capital that it was inconvenient to return home with the approach of winter. For the first time the consul in command was directed to hold his ground, and retain his place at the head of the legions, with the title of proconsul.

Political
History.

An interval of fourteen years had elapsed since the surrender of Capua and the first brief collision with the Samnites; but the second war, commencing in the year 428, was distinguished by a duration of more than twenty years, and by the terrible disaster of the Caudine Forks, where a Roman army was entangled in a defile, and compelled to lay down its arms and pass under the yoke, by the gallant Pontius Telesinus. The disgrace was harder to bear than the disaster. The city clothed itself in mourning; the consuls, who had submitted in person to this ignominy, dared not re-assume their places. Twice was a dictator nominated, but each time the auspices forbade his creation. At last Valerius Corvus, the interrex, or provisional chief magistrate, caused two of the most distinguished citizens, Papilius Cursor and Publius Philo, to be elected consuls; and Posthumius, one of the beaten generals, declaring that the republic ought not to be bound by the terms which in his distress had been extorted from him, insisted that he should himself be given up to the enemy, together with his colleagues the quæstors and tribunes, and every other officer of the legions who had signed the disgraceful capitulation. Pontius, indignant or generous, or possibly coolly calculating the consequences of accepting the proffered satisfaction for a deliberate breach of public faith, refused to receive these prisoners, and demanded the literal fulfilment of the terms they had exchanged with him. War recommenced. The Samnites gained some successes, but the Romans gradually got the upper hand; the consuls penetrated into Apulia, took Lucania, and recovered the arms, the ensigns, and the hostages captured at Caudium. Possibly the Romans fabricated the story of a complete defeat of their enemies, and the retrieval of their own dishonour by making the Samnites pass under the yoke in their turn. The brave Pontius, however, was carried captive to Rome. Nevertheless we hear soon afterwards of an irruption of the Samnites into the Roman territories in Campania, the defection of Capua, and the great defeat of the dictator Fabius Maximus at Lautulæ. These losses were balanced again by a second victory in 440, once more in the neighbourhood of Caudium, in which the Samnites were totally

Political
History.

routed. Campania is now recovered; the enemy shut up in the Apennines; colonies established, as outposts of the Roman power, at Suessa Aurunca, Interamna on the Liris, Casinum and Luceria; and the Romans so far advance in enterprise and confidence as to commence the construction of a navy to overawe the distant seaport of Tarentum. In 442 (B.C. 312) a second Decius Mus gains a triumph, for the first time, over the Samnites; but this is speedily followed by a long succession of similar distinctions. An alliance of the Samnites with the Etruscans created at this moment a formidable diversion against Rome; but the vigour and fortune of the republic prevailed, and her outposts were advanced far forward in every direction before the Samnites sued for peace.

The second Samnite war was concluded in 450; the third commenced in 455. The Samnites had again combined with the Etrurians, and had extended their league to the Umbrians and other nations of central Italy. A fresh body of Gauls was secured to this formidable alliance. This was the crowning struggle for Roman supremacy in the peninsula. The great battle of Sentinum, in which victory was secured to the republic by the self-devotion of the younger Decius, resulted in the total overthrow of the Gauls and Samnites by Q. Fabius Maximus, and was undoubtedly one of the most important actions in which the arms of Rome were engaged. The alliance of the Italian nations was broken up; henceforth the contest became more desultory, and its details are imperfectly recorded. L. Papirius Cursor and Sp. Carvilius are now the most distinguished of the Roman generals. The brave Pontius is made prisoner, led in triumph, and cruelly executed, according to the established usage of Roman warfare. The Samnites submit for the third time in the year 464 (B.C. 290). They appear indeed once more in arms a few years later, but only as the subordinate allies of a new enemy. Their independence is now finally broken, and the Roman power is definitively established over lower Italy, with the exception of a few Grecian cities in Lucania and Bruttium. Latium, Campania, Apulia, and Samnium, have now fallen under the sword of the republic. In the north the Etruscans are still hostile, but cowed and dispirited. The Gauls still hover on the frontiers of the Roman dominion, and still shake from time to time, in a well-timed foray, the unsteady allegiance of the Umbrians and Pelignians. Bands of Samnites still maintain a guerilla warfare in remote districts, and agitate the untamed savagery of Calabria, a people formed, so both Greeks and Romans asserted, by the concourse of fugitive slaves in its woods and mountains. The Grecian cities on the Lucanian coast were trembling at the steady advance of the conquerors from the Tiber. Tarentum, the only one of them which now retained an active vitality, hastened, in its feverish excitement, to form a new coalition against Rome, in which some states of Etruria were induced to join. The prætor Metellus, with 13,000 men, fell in an attempt to succour Arretium, and at the news of this disaster the Gaulish Senones rushed at once to arms. The consul Dolabella swiftly crossed the Apennines, and attacked these barbarians in their own territory, which he ravaged, in return for the devastation they had so often committed in Latium. The great battle of the Vadimonian lake crushed the Gauls and Etruscans together. Peace was re-established about 472; and without a formal surrender of the Etruscan cities, the Romans could depend from henceforth on the sure effect of their weakness and despair in reducing them to complete submission. Meanwhile the republic had been no less successful in the south. Fabricius took Thurii, and carried off the first Grecian booty to Rome. The coalition was utterly broken; and Tarentum, still unassailed, but denuded of her Italian allies, was obliged to look beyond Italy for her future protectors.

SECT. XI.—THE WAR WITH PYRRHUS.

Political
History.

The war
with Pyr-
rhus.

Rome was now destined to encounter, for the first time, the highest form of civilization and the most scientific military tactics of the ancient world. The luxurious and unwarlike cities of the Lucanian coast, though Greek by origin, had long lost the valour and discipline of their nation, and could only oppose to the rude warriors of Latium the arts of policy and statecraft. But now a genuine Greek soldiery was about to appear upon the stage, with the strength of the Macedonian phalanx and the resources of Grecian economy.

The Romans had constructed some vessels at Thurii. With these they were cruising in the Gulf of Tarentum, now nominally at peace with the republic, when the Tarentines, jealous of this attempt to form a navy, sallied forth from their harbour, declaring that the Romans were bound by treaty not to navigate their ships beyond the Lacinian promontory, and destroyed or chased home the Roman vessels. They even followed up this insult by an attack on the Roman garrison at Thurii. When Posthumius arrives as an ambassador to lay his complaint before them, they assail him with mockery and insult. He swears that the filth they fling upon his toga shall be washed away in their blood. A Roman army speedily appears before Tarentum; and the nobles, who had taken no part, perhaps, in the brutal violence of their populace, would have yielded at once; but the people, in their vanity, scorned submission to the foreigner, and invoked the aid of Pyrrhus, King of Epirus. This chief, the most noted warrior of his age, was the cousin, though several years junior, of Alexander the Great. He had succeeded his father in regular course in the throne of Epirus; but his career had been from the first that of an adventurer rather than of a sovereign. Ambitious, restless, and captivated with a vague aspiration for glory, in imitation of his illustrious relative, he was easily persuaded by the Tarentines, who promised him an extensive alliance and a force of 350,000 combatants, to undertake the deliverance of the Greeks in Italy from the threatened yoke of obscure barbarians. Landing with a veteran force of 25,000 men, and attended by 20 elephants, Pyrrhus gained a victory at Heraclea over the first consular army of the Romans, but with such loss on his own side as caused him to remark already, that such another victory would be his ruin. He recovered, indeed, some towns on the coast, as the fruits of this hard-won triumph; but the promised allies failed to make their appearance; he found the Tarentines nerveless and inefficient; he was glad to disguise his mortification by offering terms of peace to the Romans, on condition of their leaving the Greek cities in freedom, and restoring their lands to the Samnites and Apulians. Cineas, the envoy whom he sent with these terms to Rome, returned unsuccessful, but filled with admiration of the numbers, the bravery, and undaunted spirit of his master's enemies. This report inspired the King of Epirus with increased anxiety; but, brave and daring as he was, he determined to make a bold dash, and, turning the flank of a second army opposed to him, he got within a few leagues of Rome itself. A third force was recalled from the borders of Etruria to cover the capital, and he was compelled to retreat, lest he should find himself surrounded. The Romans now sent in their turn an embassy to treat for the ransom of their prisoners. The courage and presence of mind displayed by Fabricius, according to the well-known story, made a deep impression on the mind of Pyrrhus; and when the republic generously advertised him of a plot for his assassination, he was so touched by this trait of honourable feeling that he sent back the prisoners without terms. Meanwhile the condition of the Greeks in Sicily, assailed by the fleets of Carthage, became even more pressing than that of their compatriots in Italy, and Pyrrhus

seized the excuse for postponing his contest with Rome, and transporting himself to Syracuse. Here, again, his first successes only led him into fresh difficulties, and once more he was glad to escape from his actual embarrassments, and try his fortune in Italy. The Romans, however, had had time to recover from their losses; and now, familiarized with the aspect of the formidable elephants,—bulls of Lucania, as they ignorantly termed them,—they were fully a match for the Greek army in the field. Curius Dentatus gained the victory of Beneventum, and Pyrrhus was compelled to fly ignominiously to his own dominions. Curius triumphed, in a chariot drawn by four of the Libyan monsters he had taught the Romans to despise. Pyrrhus fell soon afterwards in an obscure struggle at Argos. Hostilities continued in the south of Italy for some years longer. Papirius and Carvilius once more overcame the Samnites. Tarentum submitted; its walls were overthrown, its arms and ships forfeited to the conquerors. The Carthaginians, who had recently offered their alliance to Rome, were warned off the shores of Italy, which were now completely subjected to Rome, from the Æsar and Rubicon in the north to the Straits of Messina and the Iapygian promontory.

SECT. XII.—REVIEW OF THE ROMAN GOVERNMENT AT THE PERIOD OF THE CONQUEST OF ITALY.

Review of
the Roman
govern-
ment at the
period of
the con-
quest of
Italy.

The Romans had now conquered Italy, and made the first great step towards the conquest of the world. We must pause for a moment to review the way in which they organized these new dominions, and made them a ground of vantage for the further extension of their power.

The most striking difference in the development of ancient and modern politics results from the generally republican character of the one, and monarchic constitution of the other. The extension of the Athenian and of the Roman empire was formed either by conquest or colonization, while that of the great states of modern Europe has resulted far more commonly from dynastic marriages and successions. Had ancient Italy been parcelled out among a number of sovereign families, it would probably have fallen, state by state, under the sway of one fortunate dynasty; wars might have played a part in the transformation, but dynastic alliances would have been still more effectual; Mars might have brought many nations under the yoke, but the influence of Venus would have proved still more powerful. The populations of the peninsula were sufficiently homogeneous to have constituted an aggregate people, of equal laws and similar institutions, from the Rubicon to the Straits of Messina. It might still be a question whether the configuration of the country—its great length and slender breadth of surface, its mountain divisions and diversities of soil and climate—would have permitted in ancient times a national union on such a footing, the impracticability of which in our days is recognised as a political maxim; but however this may be, the republican character of the Italian institutions of itself precluded the operation of those peaceful influences which, as we have said, might have been more effective to such an end than war, and it only remained to be seen whether the rivalries and animosities of so many equal neighbours would terminate in their mutual exhaustion and ruin, or in the avowed predominance of one.

The latter alternative, as we have seen, found place. The predominance of Rome was acknowledged. We have now to see by what methods she maintained and perpetuated it. It was no part of her policy, for it did not come within the scope of Italian ideas, to mould her conquests into one nation. On the contrary, her object was to wrest from the vanquished their independence, to stifle their nationality, to make them docile subjects; for this end, to create dif-

Political
History.

ferences and foster jealousies among them, to separate the one from another in feeling and usage, and prevent their combining together for any common purpose, least of all for the purpose of extorting common terms from their conquerors.

In the early times the patricians had been the citizens, the plebeians the subjects of the state. This distinction had, in process of time, and through many struggles, become nearly obliterated. The Romans and Italians were now to go through a like career in relation to one another. But the Romans had now become more or less conscious of the principle under which their early revolutions had evolved themselves, and they seem to have contemplated steadily from the first the gradual progress of the Italians to the goal of civic equality. They decreed that the sovereign people should be always the people of the Forum, and that its civil rights should only be exercised within the sacred limits of the city; but they provided at the same time for the admission of their subjects, one by one, within these limits, as a long probation of service and dependence should seem gradually to qualify them for political assimilation. Such admission might wound the pride and touch the immediate interests of a race of conquerors and plunderers; but the spirit of ambition and cupidity required fresh recruits to maintain it, and as the empire was extended, greater numbers were necessary to preserve it. Between the years A.U. 370–490 (384 and 264 B.C.) twelve new tribes were created, and the *Ager Romanus*, or national domain, extended from the Ciminian wood in Etruria, on the one side, to the middle of Campania, on the other. Upon this territory the censors enumerated 292,334 men capable of bearing arms, or a total population of 1,200,000 souls, to form the great central garrison of Italy. Two centuries before, according to one account, the military force of Rome was computed at only 104,214 men. While we may decline to place any reliance at least on these latter numbers, the fact of their being thus recorded evinces the belief of the Romans themselves in the early practice of political incorporation.

If we may speak of an original Roman people as contrasted with the aggregate now created, we may believe that at this time its numbers did not exceed one-half of the whole body. But the original twenty-one tribes gave it so many suffrages in the assembly, while the new recruits were enrolled in twelve additional tribes only, and exercised no more than twelve votes. Such were the tribes of the Etruscans, the Latins, the Ausonians, the Æquians, and the Volscians. A little later than the era at which we have arrived, in the year of the city 513, two more tribes were appropriated to the Sabines. But besides their inferiority in number, these new and extraneous members of the national body had little opportunity, from their distance from the Forum, of influencing the course of affairs in the city. Nor, though thus stationed in the immediate neighbourhood of the capital, did these foreign tribes occupy the whole surrounding territory. The *Ager Romanus* was intersected, almost within sight from the gates, by parcels of land which still remained in the hands of strangers, and bore the designation of *Ager peregrinus*. Several cities of Latium, such as Tibur and Pænesta, still bore the title of Latin instead of Roman, retained their own municipal institutions, and were attached to the republic not by the possession of the Roman franchise, but by the condition of a specific eligibility to it. Any of their citizens who had served certain magistracies in them, became qualified thereby for the enjoyment of citizenship at Rome, and the constant accession of individuals from this source helped to replenish the void made by perennial warfare, no less than the occasional introduction into the state of corporate communities.

The franchise, or rights of the city, thus obtained,—the object for the most part of the dearest vows of the subjects

Political
History.

of Rome,—comprehended, 1. Absolute authority over the wife and children, slaves and chattels; 2. A guarantee of personal liberty, exemption from stripes, security from capital punishment, except by the vote of the people or under military authority in the camp; 3. The suffrage; 4. Access to honours and employments; 5. The possession of Quiritary property, held under Roman law; 6. Immunity from all the taxes and tributes imposed at discretion on the subjects of the state. Such was the complete franchise of Rome; the *jus civitatis optimo jure*. To the Italians beyond the pale of the thirty-five tribes some portion of these privileges might be accorded in various measure and degree. To some the Senate gave the right of dealing (*commercium*), to others that of marriage (*conubium*). The cities of the conquered nations were arranged in different classes, according to the favour in which they were held by the conquerors,—1. The *municipia optimo jure*, or of the first class, the inhabitants of which, whenever they visited Rome, were allowed to exercise there the complete rights of Roman citizenship; 2. The *municipia* without franchise, which enjoyed indeed the title and burdens of citizenship, such as the service in the legions, but were debarred from the suffrage, and from the civil offices of the republic; 3. The cities which had renounced their ancient usages to embrace the laws and institutions of Rome, but yet were not entitled to the name of Roman. But below the *municipia* was yet another class of *prefecturae*, towns subjected to the government of a Roman officer or prefect, under the forms of Roman jurisprudence. These prefectures were generally so classed by way of precaution or punishment. Such was the state to which Capua was reduced after a revolt in which she imprudently engaged against the Romans. Such were the various grades of subjection granted according to the terms of capitulation in each case. There was still a lower rank in the descending scale, that of the *deditici*, or people who had been reduced by the fortune of war to unconditional submission; these were required to deliver up their arms together with hostages, to raze their walls or to receive a garrison within them, to pay a tribute, and to furnish besides a contingent to the armies of the republic.

The allies, as they were designated, of the republic were a class of states differing in some particulars from all these. They were the dependents of Rome, but flattered themselves that they were not her subjects. The Senate indulged them in a delusion which soothed their pride, and made them more serviceable as auxiliaries than they would have been as indignant bond-servants. Tarentum was allowed to retain the name of a free state, though here the Romans went so far as to level the walls of the city and establish a garrison in its citadel. Neapolis was free, but required to furnish vessels for the Roman marine, and contribute to the pay of its mariners. The Camertines and Heracleotes were declared "equals" of Rome (*æquo fœdere*), on terms of mutual defence. Tibur, Præneste, and most of the Etruscan cities, ranked in the same class; but the Romans took care to foster in all these cities a party of their own friends and creatures, to mould the external conduct of this free state, and, if occasion required, to find them a pretence for interfering with its domestic affairs. Such was the policy of the republic in its relations towards its conquered enemies. It is characterized by a studied absence of general measures, and of uniformity of treatment. It is deliberately framed to maintain and intensify the actual diversities of nations and circumstances. With this view, every possible hindrance, often amounting to specific prohibition, is laid in the way of common action among them, of commerce, and even of intermarriage. Gradually, however, as the power of Rome extended, her

Political
History.

jealousy relaxed, and these distinctions, long maintained, became more and more effaced. They subsided at last into three classes and conditions of rights: the *jus civitatis*, which conferred a share in the sovereignty; the *jus Latii*, which gave access or eligibility to the franchise; the *jus Italicum*, of which the burdens were greater and the prerogatives inferior. This graduated scale of privilege continued to exist under the same name down to a late period in Roman history, and was extended to the later possessions of the republic, long after the obliteration of all political distinctions between the Romans, the Latins, and the inhabitants of the peninsula generally.¹

SECT. XIII.—COLONIES AND MILITARY ROADS.

Neither the interest the more favoured of the Italians Colonies might be expected to take in the Roman franchise, to and military roads. which they were admitted, nor the gratitude of the rest for the remnant they were allowed to retain of their own nationality, could be regarded as sufficient security for their permanent submission. Throughout the length and breadth of the peninsula Rome established her armed garrisons under the form of colonies. In the spot selected for such a military station, a large portion of the national territory was confiscated by the conquerors, and some thousands of the citizens selected by lot, or on their own demand, to receive it in full possession, engaging in return to defend the interests of the republic, which were thus identified with their own. The administration of the colony thus formed, and thus strictly attached to the parent state, was organized on the model of the city. The colonists, as Roman citizens, met in their public assemblies, and chose their decemvirs and their decurions to represent the consuls and senators. Their residence was in every case, perhaps, not a new stronghold constructed for the purpose, but the fortified city of some conquered people, dispossessed even of their habitations to make way for them. Such cities were chosen, of course, for their natural strength or their commanding situation. Thus 6000 colonists were established at Beneventum to cover Campania; 14,000 at Venusia to check the Greeks of the south-eastern coast, to defend Apulia, and control the Lucanians and the Samnites. In Etruria, Sutrium and Nepete watched the valley of the Tiber; Ardea, Satricum, and Antium held the long-disturbed districts of the great plain of Latium; Velitræ, Norba, and Setia kept the keys of the Sabine mountains; Anxur closed the gates of Campania; Fregellæ, Sora, Interamna, and Minturnæ occupied the line of the Liris, the route of the Samnites when they threatened an assault on Rome. Such were the entrenched camps surrounding the city. Beyond these lay a second line of fortresses, such as Atina, Aquinum, and Casinum, in the heart of the Sabellian mountains; Vescia, Suessa-Aurunca, Sinuessa, Teanum, Cales, among the defiles through which the waters issue from them. To these may be added Alba Fucentina, northward in the country of the Marsians; Cæsula and Carseoli, among the Æquans; and Narnia, which covered the route from Umbria. More than once an enemy, such as Pyrrhus and afterwards Hannibal, succeeded by a bold effort in penetrating this double line; but it was with the loss of his communications, and such imminent danger to his rear, that his advance was paralysed, and a rapid retreat rendered inevitable. Throughout the rest of Italy the colonies were less closely planted. Samnium was occupied by two only, Beneventum and Æsernia; Picenum by three, Adria, Firmum, and Castrum; Umbria by four, Narnia, Spoleto, Ariminum, and Sena. In Campania we may enumerate Saticula, Cales, and Casilinum; Apulia was guarded by Luceria and

¹ Duruy, *Hist. des Romains*, i., ch. xi., § 1.

Political
History.

Venusia; Calabria by Brundisium and Valentia; Lucania by Pæstum; while Tarentum, Locri, Rhegium, and some other places, were only held by Roman garrisons.

To bind all these places together, and afford the means of rapid transport for the legions from point to point, the whole peninsula was traversed by numerous roads, generally branching out from Rome to every extremity. In the midst of the great Samnite wars the censor Appius commenced the construction of the Appian Way, which led from Rome across the Pomptine Marshes to Capua. From year to year this example was followed by other munificent officers of the republic; and before the conclusion of another century, the Valerian Way connected the city with Corfinium, the Aurelian coasted the shores of Etruria, the Flaminian reached Ariminum on the frontier of the Cisalpine, and the Æmilian prolonged this line as far as Placentia, on the Po. These roads were "built," according to the phrase of their constructors, with several layers of concrete and masonry, and paved with solid blocks of stone cemented together, which in many places have survived the revolution of centuries, and retain their position at the present day.¹

Panegyric
on the cha-
racter of
the Ro-
mans in the
fifth cen-
tury.

"And what a race of men these new masters of Italy were! Their private virtues legitimized their power; and it was in their manners, not less than in the ability of their Senate, that the secret of Rome's greatness resided. These conquerors of Etruria and Tarentum held poverty, discipline, and devotion ever in honour, and their patriotism partook of a religious sentiment. Three Decii surrendered their lives for the Roman army, and Manlius immolated his son to the genius of discipline. The censor Rutilius, re-elected at the expiration of his term in 265 B.C., convokes the people, and solemnly rebukes its assembly for having conferred such important functions on the same citizens twice in succession. If, on the one hand, a Rufinus must be degraded from the Senate (275 B.C.) notwithstanding his two consulships, a dictatorship, and a triumph, for possessing ten pounds of silver plate, when he was allowed no more than eight ounces; if the consul Posthumus compelled 2000 legionaries to reap his corn or to clear his woods;—Atilius Serranus, on the other, received the consular purple behind his plough; Regulus, though twice consul, possessed no more than one little field in the barren district of Pupinia; and Curius, like Fabricius and Æmilius Papus, prepared his simple meal with his own hands in wooden vessels. The same Curius refused the gold of the Samnites; Fabricius that of Pyrrhus; and Cineas, introduced into the Senate, imagined that he saw before him an assembly of kings.

"By their rigid virtues and austere manners the Romans of that age deserved their empire; by their discipline and their courage they had acquired, by their union they retained it. The perils of the war with Samnium had in fact restored peace between the two orders of citizens. Petty rivalries had been extinguished in the face of the public interest; the emancipation of the plebeians had been effectually accomplished; and the new generation of patricians, bred in the camps, had lost its bitter recollection of the popular victories. The 'new men' were now not less numerous in the Senate than the descendants of old curial families; nor did the services and glory of Papirius Cursor, of Fabius Maximus, of Appius Cæcus, and Valerius Corvus, efface the services and the glory of the three Decii, of Publius, four times consul; of Mænius, twice dictator; of Cæcilius Metellus, who commenced the illustration of the family of which Nævius was afterwards to declare, 'the Metelli are born consuls at Rome;' finally, of Curius Dentatus and Fabricius, plebeians, and not even of Roman origin at all.

Political
History.

"There was union because there was equality; because an aristocracy of blood was no longer recognised, nor was more honour paid to that of fortune. At this epoch the Roman constitution presented that safe combination of royalty, aristocracy, and democracy which Polybius, Machiavel, and Montesquieu have so much admired. The consulship gave it unity in command, the Senate experience in counsel, the people strength in action. By these three powers, mutually restricting themselves within just limits, all the forces of the state, formerly turned one against another, had found at last, after a struggle of more than two centuries, that happy equilibrium which made them all concur, with irresistible power, in working towards one common end, the greatness of the republic."²

SECT. XIV.—SOURCES OF THE HISTORY OF ROME IN THE FIFTH CENTURY.

This glowing panegyric on the character of the Roman people in the best age of the free state may be fairly deduced from the histories of the time which have come down to us. Doubtless in those histories much allowance must be made for a spirit of exaggeration and patriotic colouring in painting the actions and principles of the heroes of the republic. Nevertheless there seems sufficient reason for admitting the general truthfulness of the accounts we have received of this period, and accepting as commonly authentic what professes to be the history of Rome, at least from the time of the wars with Samnium and with Pyrrhus. It will be well to pause, then, at this point, and indicate briefly what may have been the sources of Roman history at this period.

Sources of
the history
of Rome in
the fifth
century.

The first writers of early Roman history in a connected form were Greeks,—such as Diocles of Peparethus, Timæus, and Hieronymus. Aristotle had already obtained a glimpse of the rising republic, and had signalized the taking of Rome by the Gauls; but it was not till the Romans entered into relations with Alexander of Molossus, and with Pyrrhus, that their existence became a matter of interest to the people beyond the Adriatic. The first Greek writers on the subject of this Italian city would naturally resort to the colonists of Magna Græcia for such information of their neighbour as they could furnish, and this would be derived, in the first instance, from the floating traditions which, during the preceding century, had reached Neapolis or Tarentum, conveyed by word of mouth, rather than ascertained from the scanty writings and historical monuments which might exist in Rome itself. Hence, no doubt, these original historians gave a prominent place to the stories which connected Rome with Greece,—to the legends of Evander and Æneas, of recourse to the Delphic oracle, or to the records of Athenian legislation, which thus obtained a credit not their due with succeeding inquirers. It is probable that the writings of these foreigners first excited the emulation of the Roman annalists, such as Fabius Pictor and Cincius Alimentus, who began in the sixth century to construct a vernacular History of Rome. We have no reason to suppose that historical composition was an art of native growth at Rome, any more than among other western nations, all of which, including the civilized Etruscans themselves, seem to have been wholly strangers to it. But the Romans, when they applied themselves to the art, had access to other sources than the Greeks who preceded them, and could combine the traditions and fabrications of the Greeks with the meagre chronicles and other fragmentary records existing among them. Thus we know that from a very early antiquity the priests had kept a register of the events in which they were themselves chiefly interested, such as omens and natural phenomena, to which they attached a

¹ Duruy, *Hist. des Romains*, i., ch. xi., § 2.

² *Ibid.*, p. 333.

Political
History.

religious significance; that there were also certain Fasti, or lists of magistrates, dating from a primitive epoch; and we may surmise that here and there a political incident was noted in one or other of these journals. It is certain, moreover, that the Romans, with their intense family feelings, left some private memorials of their own ancestors, and refreshed their recollection of them from time to time by domestic ceremonies and funeral laudations. The highly romantic character of so much of the early history may lead us also to conjecture that some popular traditions were preserved in the form of poetry, though of this we have no positive testimony whatever; and the inference is by no means strong enough to bear, in default thereof, the elaborate superstructure built upon it by Niebuhr and his followers. The notion, indeed, so suddenly enunciated and so hastily adopted by the students of Roman history, that our early accounts are mainly founded on a defunct series of ballads and epics, may be regarded as already exploded.¹ Thus much, however, is certain, that as far as the memory of long past events was entrusted to a mere oral tradition, its preservation was in the utmost degree precarious; while the monuments, however scanty, of written history were subjected to the sweeping devastation of the Gallic conflagration. The Romans indeed pretended that the Capitol at least had escaped the capture of the city; but no reliance can be placed on their account of the retreat and discomfiture of the Gauls; and there is good reason to suppose that their city, fortress and all, fell into the hands of the destroyers. Very few, therefore, of their records can be supposed to have escaped; it may be doubted whether the two or three documents of a previous period, which Polybius or Pliny believed they had actually seen in their own time, were genuine monuments of the age to which they were presumed to belong. That from that period a systematic fabrication commenced of records pretending to an anterior date may easily be believed; and it is from such fabrications, grounded more or less upon current traditions, that the first annalists of Rome, both Greek and Roman, drew, it may be presumed, a great part of their materials. We see, then, that, down to the period of the Gallic war, there is no firm ground for the historian of Rome. The events recorded he must suspect of being pure inventions; in the pretended progress of the constitution he will trace only a confused attempt to account for political arrangements existing at a later period. But in the sources of history posterior to the great conflagration a great change becomes apparent. Whatever the value of contemporary records may have been, however much they may have embellished and falsified by family or national pride, we may be sure at least that they once actually existed, and continued no doubt to exist for centuries. The first annalists had materials for history, were they but endowed with discretion to sift and read them rightly. It is not to be expected, indeed, that in a rude uncritical age these materials were carefully handled; and still, at least to the time of Pyrrhus, and perhaps for one generation later, many evident falsifications of history are apparent. But from the commencement of the sixth century we may be sure that the memory of events was sufficiently recent to secure the first writers of Roman history from material error regarding them. We may proceed, therefore, from this point, without misgiving, to follow the lines they have traced for us.

SECT. XV.—THE FIRST PUNIC WAR.

Political
History.

The first
Punic war.

While Rome was completing the reduction of Italy, the republic of Carthage, on the opposite coast of Africa, was rivalling her conquests in the islands of the western Mediterranean. The Greek colonies in Sicily had fallen under her dominion, as well as the barbarous tribes of Sardinia. On the extinction of the Grecian power in this quarter, the two rivals were about to come into serious collision. The Carthaginians were preparing to seize the Æolian Islands, barren rocks indeed, but almost within sight of Naples and the Campanian coast. Still, however, a single stronghold withstood them in Sicily, from whence the Romans might hope to make good a footing in that important island, and check their advance beyond it. Messina was occupied by a band of buccaneering adventurers, who had recently overthrown the government, and expelled or subjugated the inhabitants, but now, pressed hard by the Carthaginian power, presumed to solicit assistance from the legitimate government of Rome. To render such assistance was contrary to the principles of international law, even as then understood; the Romans, moreover, had just before visited a similar act of lawlessness with the severest punishment. Now, however, self-interest prevailed, and it was determined to use the opportunity for establishing a Roman force in Sicily.

A.U. 490,
B.C. 264.

Such was the origin of the first Punic war, which commenced in the year 490 (B.C. 264), and lasted without intermission for twenty-two years. The great object of the Romans was to gain possession of Sicily, a rich and fertile country, and of special importance to them, from the abundance of corn which it was fitted to produce; for Rome had already become dependent in some degree on foreign importation for the supply of a population withdrawn from the pursuits of agriculture, and engaged perpetually in the barren exercise of arms. The Strait of Messina is only 3 miles in width, and though watched by the naval forces of the great maritime republic, the Romans had little difficulty in throwing re-inforcements across it: nevertheless, they soon found it essential to their views to contend with the Carthaginians for the dominion of the seas. At first they were obliged to build their ships of war from the model of an enemy's vessel, cast accidentally on their coasts; but this ignorance of naval architecture was the least of their disadvantages in commencing the struggle; for they had no experience of naval tactics, nor even of navigation. Nevertheless they exerted themselves with their usual energy, constructed a numerous fleet, manned it by a conscription of the lowest class of citizens, such as was not admitted to serve in the legions, and fought their ships with crews of mere landmen, aiming rather at grappling and boarding the enemy, than at manœuvring against him, and sinking him with the stroke of the beak. They succeeded almost from the first, though not without many reverses, sometimes from storms, sometimes from the greater skill of the Carthaginians, in keeping the sea at least on terms of equality. In the year 498 (B.C. 256) they had so far gained the ascendancy as to be able to land a large army, under the consul Regulus, on the coast of Africa, with which they ravaged the country, and approached to the walls of the capital. But the Carthaginians, putting forth all their power, here inflicted on them a decisive defeat, making

Regulus in
Africa,
A.U. 498,
B.C. 256.

¹ "The theory of Niebuhr respecting the derivation of the early Roman history from ballads or epic lays, is also examined and refuted by Schwegler, vol. i., pp. 58-63. His principal arguments are:—1. That the conditions of an early national epic poetry were wanting among the Romans; 2. That the early history bears no mark of proceeding from plebeian poets, whose songs were animated by an anti-patrician spirit; 3. That these poems, if they had ever existed, would not have entirely disappeared; 4. That the early Roman history has not the character of free political invention, but is composed in great part of ætiological legends, of stories laboriously invented in order to explain existing names, institutions, customs, rites, and monuments. Schwegler lays it down that, as far as the early Roman history does not consist of ætiological legends, it is the deliberate fabrication of historians, or formed of legal and constitutional traditions." (Sir G. O. Lewis *On the Credibility of Early Roman History*, i. 229.) Such is the conclusion established also by the powerful reasoning of this English writer, and it is now, we believe, generally accepted by the learned in Germany.

Political History. Regulus prisoner, and suffering a small remnant only to make good its return to Italy. Regulus, we are told, was afterwards sent to Rome on parole, to negotiate peace. He dissuaded his countrymen from yielding to dishonourable terms, and returned to his captors, to be put to death, according to the popular story, with tortures, but, as the later Romans themselves allowed, to live some years in custody, and eventually to die a natural death. War was again renewed, and continued with alternate successes; the reduction of Panormus by the Romans (A.U. 500, B.C. 254), the defeat of their fleet at Drepanum (505, 249), the loss of another armament by tempest at Camarina, and the final victory at sea off the islands Ægates (513, 241). It was terminated at last by the exhaustion of the Carthaginians, who were reduced to the necessity of purchasing peace by the cession of all their claims on Sicily and the Æolian islands.

The Carthaginians now turned their attention to Spain, where they raised in a few years a new empire, which more than balanced the loss of Sicily, as well as that of Sardinia, which revolted from them, and fell, as did also Corsica, not long afterwards, under the power of the Romans. These great rivals remained at peace with one another for more than thirty years; but while the Carthaginians were acquiring the gold mines of Spain, and recruiting their armies with its hardy infantry, the Romans were making great advances in internal resources, and pushing their conquests at the same time in other quarters. In 525 they crossed the Adriatic, and made successful incursions into Illyria. The following year was distinguished by an embassy from Rome to Greece, A.U. 526, B.C. 228. The Corinthians allowed the envoys of the formidable "strangers" to take part in the Isthmian games. About this period, however, we read of a threatened invasion of Gauls. The city was struck with panic. The priests required that two men of that nation should be buried alive, as a sacrifice, in the Forum. A state of "tumult" was declared, and the whole body of the citizens raised and armed for the defence of their country. The consul Æmilius went forth at the head of the legions, and confronted the assailants in the valley of the Po, where he gained a great victory over them, and received the honours of a triumph. In another battle the Roman leader Marcellus slew, in a personal combat, the king of the Gauls, Viridomarus, and bore his arms, the "spolia opima," to the Capitol. This eminent reward of prowess had been won but twice before by Romulus and Tullus Hostilius; nor was it ever gained by a Roman captain again. The conquest of the Cisalpine and of the Istrian peninsula followed upon this repulse of the Transalpine barbarians. Meanwhile the Carthaginians were advancing to the entire dominion of Spain. Their politic chief, Hamilcar Barca, was succeeded in his command there by his son Hannibal, whom he had sworn in childhood to eternal enmity against Rome; and this enmity the young captain was now about to gratify, having persuaded his government to let him lead all the forces of the province against Italy, cross the Pyrenees, traverse the friendly regions of southern Gaul, and descend from the Alps among the newly-conquered subjects of Rome, whom he expected to unite in a mighty league against their enemies and his own.

Marcellus gains the "spolia opima."

Conquest of the Cisalpine.

SECT. XVI.—THE SECOND PUNIC WAR.

The second Punic war. The second Punic war commenced in 536 (B.C. 218) with the destruction of Saguntum by the Carthaginians, in defiance of the Roman remonstrances. Spain was now sufficiently reduced to form the basis of Hannibal's proposed operations. Assembling an army of 82,000 foot and 12,000 horse, he commenced his march. This large force, however, was very considerably reduced by the fatigues of the march, and by the garrisons it was necessary to leave

behind to secure communications through so long a route. Hannibal crossed the Rhone with little more than 50,000 men. His easiest and directest route into Italy lay by coast line, turning the lowest spur of the Maritime Alps; but this road was watched by the Roman general Scipio, and the Ligurians, into whose territory it would have led him, were less likely to receive him as a deliverer than the Gaulish tribes, such as the Boii and Insubres, who lay among the valleys of the Graian Alps, further to the north. Hannibal determined to hazard two steps, both equally bold. He allowed Scipio's army to land on his flank, at the mouth of the Rhone, and occupy the tracts which he was about to leave behind him; then taking the line of the Isere, he ventured to climb the almost inaccessible pass of the Little St Bernard, in the middle of October, with his large force of men, horses, and elephants. He had not even assured himself of the co-operation of the rude mountaineers, who harassed and attacked him on his march, and caused him both losses and delay. Indeed that perilous enterprise, which we must suppose he undertook after due calculation, as the only means of accomplishing his purpose, and launching a Carthaginian army into the bosom of a discontented population, cost him more than half the force with which he had crossed the Rhone; and when, after pausing at the summit of the pass, and encouraging his followers by showing to them the land of promise, he descended into the valley of the Po, he could muster no more than 20,000 foot and 6000 cavalry. Nor did the Gauls in these parts manifest at first any ardour in his behalf. It was not till he had gained some notable successes at the passage of Ticinus and the Trebia that they began to throw themselves vehemently into his cause. But now his numbers rapidly swelled, and while the Romans, disconcerted by their first disasters, were recruiting their broken legions, he crossed the Apennines with a force of 50,000 men. Again the passage of the marshes of the Upper Arnus cost him a large portion of his troops, and he suffered himself the loss of an eye by fever. These troubles, however, were repaid by the great victory of the Lake Thrasymenus, where the consul Flaminius, rashly meeting him, was overthrown with immense loss, and slain. From Thrasymenus to Rome was no more than 100 miles; nor was there any army to cover the city, for the other consul had posted himself with his legions at Ariminum, to guard the approach from the east. Hannibal had boldly out-flanked two armies, and beaten a third; but with all his boldness, he hesitated to strike at the enemy's centre, while leaving such forces in his rear. His intrigues with the Umbrians, the Etrurians, and other people of central Italy, had been unsuccessful. The country was generally animated with a national spirit of jealousy towards the foreigner. He turned aside to the left, and re-crossed the Apennines into Picenum; thence he directed his course towards the Grecian colonies in the south-east of the peninsula. Meanwhile the gravity of their danger had excited the patriotism of the Romans to the highest pitch. Vast exertions were made; another army was raised; and Fabius Maximus, the chief of the nobles, led it, as dictator, in quest of the enemy, who had descended along the coast of the Adriatic into Apulia. Here, too, where Hannibal had had better hopes, the population showed itself indifferent, if not hostile, to its deliverers. The Carthaginian was anxious to stake his fortunes on a battle; but Fabius knew the value of delay, and refused to allow his raw recruits to engage with the despair of sturdy veterans and an able general. Thus matters stood for some time. The condition of the invader becoming daily more precarious, when Terentius Varro, now consul, and enjoying command every alternate day, yielded to his own and his men's impatience, and engaged the enemy in the pitched battle of Cannæ. This Battle of Cannæ was noted as the most disastrous defeat the Romans ever sustained. Æmilius, the other consul, and 45,000 of their

soldiers were slain, and Hannibal sent to Carthage a bushel of golden rings taken from the persons of the knights who had fallen. It was only the extreme debility of the victor, even after this victory, that gave Rome a breathing-time, and the devotion of the citizens would not suffer them to despair of the commonwealth in the hour of her greatest humiliation. Hannibal was admitted into Capua; but this was almost the only fruit of his triumph; and the alluements of this luxurious retreat were more fatal to the discipline of his army, and to his own reputation, than even a defeat.

Hannibal now urged his government to send him reinforcements; but a rival faction predominated in the Carthaginian Senate, and caused the resources of the country to be diverted to Spain: indeed, he possessed no port on the coast of Italy at which an army could have made good its landing. The Roman forces grew, in the language of the poet, from defeat, as the branches of the ilex under the pruning-knife. Numerous fleets and armies were speedily arrayed, and Hannibal found himself surrounded in Capua by 220,000 men in arms. During the following years he was occupied painfully, and with little success, in the siege of the strong places around him, while Fabius gained the title of *Cunctator* ("The Delayer"), from the cautious tactics with which he shunned encountering him in the field. At last Hannibal was obliged to make his escape from the toils which were closing around him by a rapid retreat into Apulia, leaving Capua to the vengeance of the Romans, who treated it as a revolted dependency. When it surrendered, after a long blockade, seventy of its senators were scourged to death, three hundred nobles thrown into chains, and the whole population sold as slaves. Such was a sample of the policy of the republic towards a people whom, on the principles of national law then recognised, it might justly regard as rebels.

Capture of
Syracuse,
A U 542,
B C. 212.

Disastious, however, as Hannibal's affairs in Italy now were, he was able to get some respite by the diversions his intrigues effected in other quarters. The Romans were obliged to send Marcellus with a powerful fleet to chastise the defection of Syracuse, which was only taken after a long siege, rendered memorable by the ingenuity employed in its defence by the mathematician Archimedes. Marcellus himself fell soon afterwards into an ambuscade in Apulia. Scipio, who had conducted several campaigns in Spain, allowed Hasdrubal, the brother of Hannibal, to escape him, and cross the Alps with a large re-inforcement. Hannibal collected all his resources to effect a junction with this powerful auxiliary. Rome put forth her full strength to encounter the double danger. Livius confronted Hasdrubal in Umbria, while Claudius Nero encamped before Hannibal. But Nero, with happy temerity, broke up from his quarters with a picked division of his troops, and joining Livius, surprised Hasdrubal on the River Metaurus. The united forces of the Romans obtained a complete victory; and Hannibal was first made aware of this terrible disaster by receiving the head of his brother thrown exultingly into his camp.

Battle of
Metaurus,
A U. 547,
B.C. 207.

The Romans, notwithstanding the occupation of so large a part of their own territories by a hostile force, had continued to maintain an army in Spain, and persisted in the task of wresting that important province from Carthage. In the course of this war two Scipios perished; but a third, the most distinguished of this illustrious house, known afterwards as the elder Africanus, completed the conquest, and, flushed with victory, urged the Senate to transfer the contest to Africa itself. This bold manœuvre was opposed by the cautious Fabius, but the enthusiasm of Scipio prevailed; and when a Roman army was landed in the neighbourhood of Carthage, the enemy were compelled to recall Hannibal for the defence of their own homes. Hannibal effected his retreat, quitting Italy after an occupation of

Political
History.

fifteen years; but it was only to encounter a general of equal skill, and an army not less trained to conquer than his own, and to suffer the decisive overthrow at Zama, which laid his country prostrate at the feet of the Romans. Carthage sued for peace, but was required to surrender all her remaining possessions except the district immediately adjacent, together with her ships, her elephants, and her treasure. She still retained her brave commander Hannibal, and allowed him to take the lead in her councils, in which he was still animated by the same hatred of the Romans and zeal for the advancement of his country's interests. The Romans watched his proceedings with jealousy, and he was soon obliged to flee to the distant court of Syria, lest they should insist on his being delivered up to them. The second Punic war, thus brought to a triumphant close, was the most important struggle in which Rome was ever engaged,—one of the most important perhaps in the history of the human race; the event of which, instead of crushing the rising fortunes of the republic, established her in the secure enjoyment of the greatest power in the civilized world, and was the harbinger of the rapid succession of triumphs which made her, in the course of another century and a half, mistress of the fairest regions of Europe, Africa, and Asia.

Battle of
Zama,
A U 553,
B.C. 201.

SECT. XVII.—POLITICAL CONDITION OF THE WORLD AT THIS PERIOD.

The fall of Carthage secured to Rome a complete preponderance throughout the western regions of Europe and Africa. Placing her ally Masinissa on the throne of Numidia, she kept her prostrate rival in a constant state of terror and annoyance at home, while she prosecuted at leisure the plans of further aggrandisement she had long contemplated. In Spain the legions which had formerly assisted the rude natives against the Carthaginians were now prepared to turn upon them, with every advantage of skill and resources; and though the complete reduction of the Iberian peninsula was the work of more than two centuries, and cost the efforts of many armies and a long succession of generals, the issue was never doubtful, and the progress of the invaders, which triumphed very early over the best and richest parts of the country, was only retarded in the mountains, or on distant and inhospitable shores. Nearer home, in the Cisalpine, the Romans exercised a forbearance or evinced a caution not easy to explain. They suffered the Gaulish tribes to retain their independence almost unassailed. But the Gauls themselves seem from this time to have lost the aggressive spirit which had so long distinguished them. They devoted themselves to the habits of settled life, turned to good account the teeming fertility of their soil, and prepared for Rome, when at leisure to make the acquisition, the fairest and wealthiest of all her provinces. Gaul beyond the Alps, and Germany beyond the Rhine, remained at this time almost equally unknown to the conquerors of Carthage, and were equally disregarded by her greedy ambition. In the south, the north, and the west, there was little to engage the interest of her predatory chiefs; but when they looked eastward, they saw before them vast countries filled with the accumulated wealth of ages of civilization,—presenting indeed an imposing front of arms and organization, but, as perhaps they had already learned, devoid of the vital spirit of nationality, and ready to crumble into dust at the first rude shock of a lusty and resolute assailant.

At the death of Alexander the Great the Macedonian empire had been split into several parts; a century after his death it had fallen to pieces. Babylon had become the seat of a Parthian monarchy, which held the valleys of the Tigris and Euphrates; while the realms to the eastward had renounced all connection with the west, from which they were now permanently separated. Antiochus main-

Political

this period.

Political
History.

tained a powerful empire in Asia Minor and Syria, extending from Pelusium to Smyrna; but the northern districts of the peninsula had been seized by various lesser potentates. The Gauls, under the name of Galatæ, occupied one province. There was a kingdom of Bithynia, another of Pontus, another of Pergamus. The states of Lycia maintained an independent confederation. In the interior of the country, the Isaurians and Lycaonians, to whom may be added some tribes of the Cilicians, to whatever sovereign they were nominally subject, were merely lawless freebooters. The most flourishing of all existing polities at this time was the kingdom of Egypt, under the dynasty of the Ptolemies, who, secure in their distant and scarcely accessible territory, had leisure to accumulate wealth and to foster the arts and sciences. The second century B.C. in Egypt may be regarded as the crowning period of intellect and cultivation in the ancient world. Besides their possessions on the continent of Africa, the Ptolemies possessed the island of Cyprus, and the acquisition of this marine dependency, as well as the interests of their commerce, on which the prosperity of their kingdom mainly depended, made them jealous of the Carthaginians, and disposed them to an alliance with Rome. The republic had first entered into relations with Egypt under Ptolemy Philadelphus, in the year 481 (B.C. 273); and such was now the intimacy between the two powers, that the Roman Senate was chosen as the fittest guardian for Ptolemy Epiphanes, at this time the youthful heir to the throne of his ancestors.

The European provinces of the empire of Alexander were at this time divided among three principal powers. The throne of Macedonia itself was occupied by a Philipippus descended from the old royal stock; but southern Greece had succeeded in re-asserting its independence, and the greater number of its communities, drained as they were by conquest and colonization, and enervated by luxury and corruption, still maintained a shadow of their former greatness by combination, under the title of the Achæan League. To the west lay the semi-Hellenic district of Ætolia, with its fierce predatory tribes, combined under the sway of a military chieftain, ever threatening the feeble civilization of Greece proper. Indeed, both within and without the Achæan frontiers the greatest anarchy prevailed; the control of a powerful protector had been ill exchanged for the name of liberty, which was only the license of the craftiest and strongest; day by day the monuments of ancient art, all that remained for Greece to boast of, were scattered or demolished; and it is only to Roman aggression and cupidity, soon to be let loose upon them, that we owe the preservation of such remnants of them as have survived to our times. Among these western states Macedonia might still claim the pre-eminence. Surrounded by the sea or by almost impassable mountains, inhabited still by a brave and patriotic people, this kingdom would have been truly powerful, but for the weakness entailed upon it by the number of its distant and disjointed possessions. It held sway beyond its natural frontiers over Thessaly and Eubœa, Opus, Elatea, and part of Phocis; and occupied the citadel of Corinth and the town of Orchomenus in Arcadia. It maintained garrisons in three of the Cyclades,—Andros, Paros, and Cythnus,—as well as in Thasus and some cities on the coast of Thrace and Asia. A considerable part of Caria also belonged to it. Each of these possessions entailed upon it jealousies and enmities of its own; and its power was exhausted in the attempt to make head at the same moment against all the states of the Achæan League, against the kings of Pergamus and the chiefs of Thrace, against the maritime republic of Rhodes, and against the wild mountaineers of Ætolia. For a time the balance of forces was fairly main-

tained; but when the Ætolians invited the arm of Rome to their assistance, this equality was speedily displaced. Philip was the last to perceive the inevitable issue. When the Senate sent to declare hostilities against him, he would only reply to Paulus Æmilius, the Roman envoy, in terms of railery and scorn.

Political
History.

SECT. XVIII.—WARS WITH PHILIP AND ANTIOCHUS.

Already, during the occupation of southern Italy by Hannibal, the Romans had been taught to regard the King of Macedon as an enemy, who watched every opportunity to crush them, and whose blow they must not hesitate to anticipate. The overthrow of Carthage had hardly been accomplished when the Senate insisted on declaring war against this distant intriguer, and urged the reluctant commons of the city to pour forth their blood and treasure again without a moment's respite. At this period, indeed, and for many years afterwards, Rome acted like the spendthrift who squanders his capital in the enjoyment of the hour. The blood of Rome and Italy was lavished without stint, and the Senate, in its selfishness and short-sightedness was content to receive in its stead a constant influx of foreigners and barbarians, captured in war or purchased in the slave-market, and condemned to cultivate its fields in chains. The fatal result of this policy will be soon exhibited; at this era it was not foreseen, or was recklessly disregarded. The cries of the Achæans for protection against Philip were eagerly listened to, and an army was sent to rescue the feeble remains of Grecian liberty, as it styled itself, from the menace of a second Macedonian conquest. The teeming population of the Hellenic peninsula, which had formerly been maintained by the commerce of the world, had found vent, during the last century of decay and impoverishment, in a constant stream of emigration to Asia and Africa. As colonists, as traders, as mercenary soldiers, the Greeks were scattered through both continents; but Greece herself had begun to experience a rapidly-increasing depopulation, and her military force and military spirit had sunk to a very low ebb. Sparta, indeed, made an attempt to revive the warlike institutions of Lycurgus, and Philopœmen, the general of the League, displayed many of the highest qualities of his noble race; but the nation was quite unable to defend itself against the enemy, who had planted himself in so many important positions within its territory. The aid, however, of two Roman legions, backed by the alliance of Ætolia, sufficed to drive Philip within his proper frontiers; and though one Roman army was ignominiously defeated, Flamininus with a second routed the Macedonian phalanx at Cynoscephalæ, and established the superiority of the Roman tactics. The consul proclaimed the restoration of Grecian independence, presided in person at the Isthmian games, and declared that the Romans themselves were descended from Æneas. The Greeks in return dedicated their offerings to "Titus and Hercules," to "Titus and Apollo."¹

Wars with
Philip and
Antiochus.

Battle of
Cynosce-
phalæ,
A. U. 557,
B. C. 197.

Though the Romans were thus moderate in their conduct towards Greece, they took care to establish such a balance of power between the Ætolians, the Achæans, and Nabis the tyrant of Sparta, as would secure a perpetual recurrence of strife among them, and require their own intervention in due season. But their policy was furthered by a movement from without. Hannibal, whom they had demanded from Carthage, had taken refuge with Antiochus, King of Syria, and was urging his patron to send him with an army into Italy. Antiochus, shrinking from such a hazard, ventured to confront the Romans in Greece, incited thereto by the Ætolians; but both he and his new allies were easily routed. In 562 (B.C. 192) the Romans

¹ Michelet, *Hist. de Rome*, ii. 183. Titus was the prænomen of Quinctius Flamininus.

Political History.

gained a complete victory over him at Thermopylæ; he was driven back from Europe, and compelled to take what measures he could for closing the continent of Asia against the triumphant advance of the legions. The Romans, however, secured the alliance of Macedon, Rhodes, and Pergamus, and obtained the necessary means of transport. In 564 they set foot for the first time in Asia, and after a short campaign engaged the enemy at Magnesia, defeating him, according to their own account, with unparalleled disproportion of loss, and reducing him at one blow to terms the most humiliating. Antiochus consented to relinquish almost all his possessions in Asia Minor, together with his elephants and 15,000 talents in money. Here, as in Greece, the republic, unprepared to occupy the vast regions it had so suddenly conquered, abstained from all territorial annexation, and contented itself with dividing the country between its faithful allies. In the heart of Asia Minor Rome encountered again her ancient enemies the Gauls. Upon these people she made war separately, and reduced them to dependence upon Eumenes, King of Pergamus and Phrygia.

SECT. XIX.—STATE OF IDEAS AND MANNERS IN THE SIXTH CENTURY OF THE CITY.

State of ideas and manners in the sixth century of the city.

The desultory and occasional relations which Rome had hitherto entertained with Greece became now constant, and rapidly increased in closeness and mutual influence. This influence is conspicuously apparent in the shape which the old mythology of Italy began now to assume, in the disappearance of many ancient national divinities, and the introduction of Greek deities in their place. The Sabine names of Consus, Lunus, Juturna, Feronia, and others, are lost altogether, or merged in those of foreign divinities, whose attributes are supposed to resemble their Apollo, first honoured with a temple at Rome, A. U. 324, advances in estimation among the citizens, and obtains the distinction of public games in 542. Æsculapius is evoked from Epidaurus by a decree of the Senate in 463. Cybele, or as the Romans call her, Bona Dea, is invited to Rome in 547. The introduction of the Bacchanalia, or mysteries of the Grecian Bacchus, caused so much disturbance or jealousy that the Senate in 568 issued a decree for their suppression in Rome and Italy. But the sceptical philosophy of Greece followed quickly in the train of her religious ceremonies. The poet Ennius introduced the rational explanations of ancient belief recommended to his countrymen by the Greek Euemercus; and from rationalism the step was easy to doubt, and finally to disbelief. The magistrates of Rome maintained the ceremonial of processions, sacrifices, and auguries, as an engine of state policy, but the higher classes almost wholly renounced their fathers' faith in them, and had little scruple in openly deriding them. From the time, indeed, that the plebeians had been admitted to the priesthoods and augurships, the nobility of Rome had slackened in their zeal for the maintenance of the old traditions. The Pottii abandoned to their slaves the cult of their patron Hercules. Marcellus threw into the sea the sacred fowls which refused to present a favourable omen. The common sceptical disposition of the day is represented by the expression of Ennius: "If there are gods, at least they do not trouble themselves with the care of human affairs."

Influence of the Greek language in Rome.

At this period the Roman nobles began to make use of the Greek language, and got themselves instructed in it by slaves or clients of Greek extraction. They employed Greek writers to compose their history for them. Diocles of Peparethus, as has been said, was the first who composed a narrative of the foundation of the city. The freedmen, to whom the task was now naturally assigned of celebrating the exploits of their patrons' families, were doubt-

Political History.

less prompt in embellishing them. Hence we may ascribe to this period the rage for discovering a Grecian extraction, or a Trojan, which was considered equally honourable, for the Roman gentes. Æneas and Hercules, with their sons and comrades, were made to serve as founders for many patrician houses. As soon as the Romans set foot in Phrygia, they recognised their pretended connection with the restored city of Ilum. The Scipios and other magnates paid court to Grecian poets and historians, and received the incense of flattery in return. Ennius, the first of the Roman poets, a native of Calabria, who pretended himself to a Grecian origin, and was equally versed in the Greek and the Latin tongues, introduced the works of Homer to the Italians by imitation and translation, and was long held by his grateful countrymen as a worthy rival of the father of epic verse. Instruction in the Greek language and literature became, under the name of Grammar, the most essential part of a liberal education, and every Roman mansion had its Grecian pedagogue to train the children of the family in this necessary lore. The Greek women, fascinating and accomplished, completed the subjugation of the Roman conquerors. The rough and homely matrons of Sabellia could no longer retain the hearts of their spouses, ensnared by the wiles of these foreign slaves and mistresses. The injured women were not slow in avenging themselves. The first divorce at Rome had taken place in the year 520. About half a century later, in 586, occurred the scandal of the Bacchanalian mysteries, at which many hundreds of Roman matrons were found to have devoted themselves to orgies of the most fearful licentiousness.

If we take a further glance at the manners and customs of the Romans at this period, we may observe how the life of the city becomes distinguished from that of the country, and that of the Campanian baths or watering-places, from both or other. The first was the life of the Forum and the temples; the stated performance of civil and religious acts; the holding of levees of freedmen in the mornings; giving of legal opinions to friends and clients; public business in the Forum or Senate-house towards noon; preparation for public speaking with hired rhetoricians; retirement for sleep at mid-day; the exercises of the Campus Martius, swimming, wrestling, and fencing, in the afternoon; the supper, diversified with singing and buffoonery; and so to bed at sundown. In the country there was the superintendence of the farm and household; hunting, fishing, and other field-sports; the employment of leisure hours in reading, writing, or dictating, generally on a couch or even in bed; sleeping much in the day, but watching with the dawn of morning. At the baths there was a complete holiday from all duties, public or domestic; throwing off the toga, going barefoot, and lightly clad in a Greek dressing-gown; lounging through the day, gossiping with idle acquaintances, indulging in long and frequent ablutions, invoking the aid of foreign artists in song and music to while away the hours of vacant indolence. While, indeed, the Roman was equally proud of the austere discipline of the city and the fields, he was ashamed of his recreations at the sea-side, and regarded it as an indulgence almost akin to vice to relax even for a moment from the stern routine of self-imposed duty. But the siren sloth was gradually gaining his ear, and every further step he took into the realms of Grecian luxury and voluptuousness estranged him more and more from the love of business which he had embraced as a passion, and become inured to as a second nature. The domestic morality of the Romans was thus already undermined in many of its dearest relations, when a guilty ambition began first to prompt them to seek, in the conduct of public affairs, a personal and selfish aggrandisement.

At this period, indeed, the high civil position, maintained by a narrow oligarchy of noble families closely connected

with one another by marriage, which shared among themselves all the great offices of the commonwealth, might naturally foster such irregular aspirations, and point to the establishment of a monarchy, limited by the jealousies of its aristocratic assessors, in the place of a republic which was democratic in name only. To Scipio Africanus, in the exuberance of their joy at his triumphs, the people had offered, of their own accord, a consulship for life. This would have made him at once a constitutional sovereign, a doge, or a king. We are told that he declined the proffered honour: moderation both in pleasure and in ambition was his characteristic quality. But at a later period, when any such prudent and temperate resolution had become impossible, Cicero takes a melancholy pleasure in representing another Scipio, the immediate descendant of the elder Africanus, as praising in a limited monarchy the best ideal of government. Had the nobles been left to work out their own career, this is the consummation to which it might soon have been brought; but their career was rudely intercepted by the torrent of national corruption which now broke down every moral barrier; the pride and luxury engendered by their Greek and Asiatic triumphs produced a sudden re-action in the popular mind against them. When Cato the elder, a rude but vigorous scion of the Latian homesteads, took on himself to rebuke their abandonment of national usage and tradition, he found the people well disposed, to support and urge him onwards. The poet Nævius, the first of the Roman satirists, had met with popular sympathy in his gibes against the haughty Scipios and Metelli; he had been banished through their influence to Africa; but the spirit of criticism and raillery survived. Cato served the state in war and peace, and was carried through the career of honours to the consulship, and eventually to the censorship, from which last office he derived the title by which he is distinguished in history. In every place, and on all occasions, he rebuked the pride of the nobles and abated their insolence. He caused their chiefs to be cited before the popular assembly, but they had yet authority enough to repel the charges against them by such language as that of Æmilius Scaurus: "Varus accuses Æmilius of corruption; Æmilius denies it: Romans, which do you believe?" Scipio Africanus disdained, on a similar occasion, to reply at all; and only exclaimed, as he surmounted the Capitol,—"This is the anniversary of my victory over Hannibal: Romans, thank the gods, and pray that you may always have such a champion!" Nevertheless Scipio was compelled at last to withdraw from affairs, and ended his life at a private residence in Campania, directing these words to be inscribed upon his sepulchre:—"Thankless country, thou shalt not possess even my bones!" Further prosecutions were directed against his family, some of whom seem to have been guilty of accepting bribes from Antiochus; and Cato had the satisfaction of thoroughly humiliating the chiefs of the Roman oligarchy.

SECT. XX.—PROGRESS OF CONQUEST IN THE EAST AND WEST.

Death of
Hannibal,
A.U. 572,
B.C. 182.

Hannibal, driven from the court of Antiochus to that of Prusias, King of Bithynia, and again demanded by the Romans, had poisoned himself about the year 572 (B.C. 182), and thus relieved from equal anxiety both his friends and enemies. The authority of the republic was becoming consolidated throughout Greece and Asia Minor, when Perseus, the son and successor of Philip, undertook to form a general confederacy of the eastern powers against them. Before, however, this alliance had been effected, he precipitated himself rashly into arms, hoping to cement it by victory; and though he obtained at the outset a brilliant success, he was mortified to find himself still imperfectly supported. Alone, or with no other aid than the neutrality

of the states invited by Rome to attack him, he still maintained the contest, defeating the enemy in several engagements, till they sent against him their veteran general Paulus Æmilius, with an overwhelming force of 100,000 men. Once more the Macedonian phalanx seemed on the point of recovering the charm of invincibility; but after a fierce struggle, the fortune of the legion prevailed: Perseus was vanquished on the field of Pydna, in one of the most decisive battles of Roman history, and soon afterwards taken. The kingdom which he had hazarded and lost was annexed to the dominions of the republic, and Perseus himself led at the car of his conqueror to the Capitol, thrown into a dungeon, and suffered to languish miserably till his death, two years later. The last of the kings of Macedonia was long remembered as one of the most formidable enemies Rome had ever encountered, along with Hannibal and Pyrrhus.

Political
History.

Battle of
Pydna,
A.U. 586,
B.C. 168.

The overthrow of Perseus was followed by an attack on the precarious independence still allowed to Antiochus. The King of Syria, after the check he had received in the west, had turned his arms southward. He had almost effected the conquest of Egypt, the ally of Rome, when Popilius Lænas, the envoy of the Senate, required him to desist from his enterprise. He demanded some time to deliberate, but Popilius drew a circle around him in the sand with his stick, and peremptorily forbade him to pass it till he had given his response. Antiochus, baffled by this firmness, acquiesced in the demand, and retired home crestfallen. The Senate divided between two rival brothers of the house of Ptolemy the throne which it had saved to their family.

A.U. 586,
B.C. 168.

The kings of the earth bowed in succession before the assembly of kings. Masinissa acknowledged that to them he owed the crown of Numidia. Prusias saluted them as his gods and saviours, and confessed that he was no better than a client or freedman of his mighty masters. Phrygia, Greece, and Rhodes were each subjected in different measures to the anger of the republic, which they had failed to defend against the late attack of the Macedonians. The Greeks, irritated and alarmed, at last took up arms in their own defence; but the march of Rome was irresistible; and in 608 (B.C. 146) her barbarity was signalized by the sack and conflagration of Corinth under Mamurius. Of all her heinous acts, this was one of the most memorable. By the Greeks it was never forgotten; the Romans themselves, at least in later times, were ashamed of it. The same year saw another melancholy catastrophe, the final destruction of Carthage, which had ventured to rise a third time against her triumphant rival, and was taken and razed to the ground by Scipio Æmilianus. At the sight of this fearful ruin the accomplished Roman could not but think, it was said, with a sorrowful foreboding, of the time when his own city might be destined to a like fate, and repeated the lines of Homer predicting the overthrow of Troy divine.

Sack of
Corinth,
A.U. 608,
B.C. 146.

Final de-
struction of
Carthage.

It was from a reminiscence of the terror they had so long felt in the rivalry of Carthage that the Romans persisted for ages in characterizing her, in history and in poetry, as the type of faithlessness and impiety. But they dignified to give the title of a *second Carthage* to a city of much less fame and importance, though rendered memorable in their annals by the obstinacy of its defence and the grandeur of its fall. The perseverance of many Roman generals, among them of Cato, and finally of Sempronius Gracchus, had effected the pacification, as it was called, of the Iberian peninsula. But such pacifications were never complete or lasting. The Celtiberians in the north had continued to harass the Roman outposts, and the prætors commanding in the province had made their hostile attitude an excuse for repeated massacre and pillage. Sulpicius Galba had disgraced the Roman name by treating with the Lusitanians, and treacherously slaughtering them to the number of 30,000. The consul Lucullus acted with equal baseness

Political
History.

towards the Celtiberians. Driven to fury by such provocations, the mountaineers became more implacable than ever. Viriathus, the gallant chief of the Lusitanians, maintained the war for five years with unexpected success; and uniting in confederacy with the Celtiberians, forced the Romans at last, after many defeats, to conclude peace with him on equal terms. When hostilities again broke out, Cæpio found means to assassinate this formidable enemy, and the Lusitanians were at length reduced to submission. The last place that now held out was Numantia, a city of the Celtiberians in the upper valley of the Douro. Several consuls and prætors had failed in their attempts to reduce this fortress, and Fabius Servilianus had suffered a disgraceful defeat before it. Mancinus brought the defenders to terms; but the Senate was dissatisfied with his concessions, disavowed the treaty, and at the same time, from a feeling of superstition, not of honour, delivered its author to the enemy. It was reserved for Scipio Æmilianus, the conqueror of Carthage, to reduce Numantia at last by blockade. In the extremity of famine, the survivors of many victories fell at last on one another's swords.

Conquest of
Spain, and
fall of Nu-
mantia,
A.D. 611,
B.C. 133.

While interfering pertinaciously in the affairs of all the kings of Asia, the Romans had hitherto abstained systematically from annexing any portion of their territories. They conducted their astute policy by means of commissioners rather than of legionaries. They left the ancient thrones erect, but they occupied them with creatures of their own. The princes of Egypt, as well as those of Cyprus and the Cyrenaica, which had been constituted separate states, held their crowns under the patronage or direct appointment of the Senate. The republic had retained a son of Antiochus Epiphanes as a hostage, and interfered with powerful authority in the nomination of his successors. He designated the heir of Eumenes, King of Phrygia; and at last, in the year 621 (B.C. 133), allowed Attalus III., the last of his race, to bequeath his kingdom to Rome. Aquilius was sent with an army to enforce the ratification of this testament; and thus the republic became possessed of the magnificent territory which she entitled the province of Asia, and which she continued always to regard as the most choice and valuable of her acquisitions.

SECT. XXI.—SPIRIT OF THE ROMAN GOVERNMENT AT HOME AND ABROAD.

Spirit of
the Roman
govern-
ment at
home and
abroad.

The power of Rome was now paramount in the four great peninsulas which project into the Mediterranean, together with its principal islands, while her influence and authority were recognised at almost every point along its far-reaching coast-line. Italy, the centre and nucleus of this power, was either "Roman soil," or placed under the ultimate control of the prætors and magistrates of Rome. Spain, Greece, and Asia Minor, were reduced substantially to the form of provinces; so were also the islands of the Tyrrhene, the Ionian, and the Ægean seas. Another province was constituted on the opposite coast of Africa, comprising the dominion of Carthage; while the kingdoms of Numidia on the west, and of Cyrene and Egypt on the east, were, as we have seen, in a state of pupillage and dependence. At the eastern end of the Mediterranean the Jews had entered into alliance with the republic; the independence of Syria was imperfect and precarious; Rhodes was indulged with freedom, which she was fain to purchase with impious flattery, in erecting a statue to the divinity of Rome; while a few petty states of Asia Minor existed only on sufferance. The rugged districts of Illyria offered little temptation to Roman cupidity; but the subjection of Macedonia was fully assured. Massilia and Narbo cultivated the alliance of the Senate, and were about to invite its assistance against the surrounding barbarians, and lay the first foundations of a province beyond the Alps.

Political
History.

The Romans regarded themselves as a race of conquerors, and at every point beyond the limits of their colonies they encamped rather than settled. A standing force of one or more legions, with numerous auxiliary battalions, was maintained in each of the provinces, and every year, or at a later period triennially, an officer with the style of proconsul or proprætor, having served the highest magistracies at home, was sent forth to command it. This functionary wielded the whole authority of the state, civil as well as military, within his own province, and was required to govern with a single eye to the security and enrichment of the republic. During his term of office his acts were unquestioned; if he had not strictly the right to declare war against a potentate on the frontier, his instructions were generally such as to cover any excess of zeal which tended to the advancement of his country's interests. On his return home, his quæstor was required to submit to the Senate an account of his proceedings, and these might be disavowed by the hostile vote of an opposite faction. While every act of the magistrates in the city was regulated more or less strictly by rule and precedent, if not by written enactment, the proconsul was at liberty to administer justice to the provincials according to the edict or programme published by himself on assuming the government. The organization of the conquered territories in Etruria and Samnium, already described, was extended to Iberia, Greece, and Asia. Some communities were allowed to enjoy a qualified independence, some were invested with Latin or Italian privileges; the lands of others were confiscated, wholly or in part, to the domain of the republic; tolls and customs were exacted, partly for imperial, partly for local expenditure; but a contribution, varying in amount, levied upon the produce of the land, formed a constant source of revenue to the state. Such was the wealth which accrued to the conquerors on the reduction of Macedonia, that from thenceforth the land-tax was wholly remitted to the favoured soil of Italy.

With the rights of conquest understood as they were at Rome, we may imagine the tyranny to which the conquered people were subjected. The spoliation of the provinces by the chiefs and their subordinates was not only winked at; to a great extent it was positively encouraged and defended, on the plea that to impoverish the fallen enemy was to cut the sinews of future rebellion. Neither the property nor the honour, nor even the lives of the provincials, were safe from the cupidity and cruelty of the proconsul, and of the *cohort* of officials whom he carried in his train. It was fortunate, indeed, that the rapacity of these oppressors was so often directed to seizing the choicest works of ancient art, and transporting them to Rome, which proved the safest receptacle for those precious relics of a perishing civilization. The rude conquerors of Greece and Asia imbibed a taste for these monuments of a genius with which they had so little in common, and succeeded in persuading the still ruder populace at home that no trophies of victory were so glorious as the works of Grecian statuary and painters. The provincials, who had been born amongst these cherished treasures, groaned at the loss of them, for which many a bitter sarcasm at their ignorant spoilers afforded slender consolation; nevertheless they learned to profit by their security from the worse miseries of foreign warfare, and extracted wealth from their fertile soil more rapidly than their masters could consume it. Achaia, indeed, or central Greece, was stricken with a palsy from which no domestic tranquillity could restore her, and continued to dwindle in population and resources; the ancient arts of Carthage perished with the decay of the Punic element in her population, which seems to have been quickly exhausted; but the progress of improvement was felt sensibly in Asia; and the youthful vigour of Spain, now first turned to the pursuits of industry and letters, struck deep

Political
History.

into the soil, and produced in the course of ages an abundant harvest of economical and intellectual improvement. On the whole, the effete and imbecile among the nations were extinguished by the blow which struck down their liberties; but the young and lusty rallied from the shock; and the empire of Rome became, throughout large portions of the globe, the creator of a new life of progress and development.

SECT. XXII.—ASSEMBLIES, ORDERS, AND MAGISTRACIES OF THE ROMAN PEOPLE.

Assemblies,
orders, and
magistracies
of the
Roman
people.

The warlike instincts of the Roman people, dispersed over a great part of Italy, or planted in colonies beyond it, were now in full play. The wealth of the East and West, which served to inflame its cupidity, had not yet enervated its vital forces. Its armies maintained the old traditions of discipline and obedience, as well as their ancient valour; its officers, ambitious and greedy for themselves, were still devoted to the glory of their country, and inspired with zeal for the extension of her dominion. Though the march of Roman conquest advanced for another century with almost unabated vigour, which was not exhausted in a second or a third, all these conditions of a flourishing and lasting empire began from this period to decline, and the social decay which commenced at the heart spread slowly through the limbs of the whole body. We have noticed some of the moral causes of this decline; we will now pause once more, to exhibit the seeds of destruction already germinating in the political constitution of the republic.

Notwithstanding the high reputation for disinterested virtue which the ancient Romans have obtained with posterity, we know that no people was ever more intensely devoted to making of money. They amassed riches not only by plunder in war, but at home by usury and thrift, abroad by commerce and speculation. To the possessors of this much-coveted wealth they were ever prone to pay the most slavish deference. Hence, whatever may have been the real character of their political organization, as long as a ruling caste held predominance in the republic, the equalization of the rival orders was followed by the establishment of an aristocracy almost purely of money. The old constitution, such as it is represented to us, of the patrician curies, or the heads of the *gentes* or houses, of those who alone were proprietors, alone were judges, alone priests and augurs, of those, in short, who formed among themselves the ancient commonwealth of the Quirites, had passed away. The comitia of the curies still nominally existed, and was indeed convened for the performance of some religious ceremonies, but it had no political weight. The real elements of power resided in the comitia of the centuries and tribes; and in both of these, though differently constituted, the influence of property prevailed over numbers. To secure this predominance in assemblies which embraced the whole body of the Roman people, some ingenious contrivance was required. The citizens were divided, as we have seen, into 35 tribes, each tribe was subdivided into senior and junior, and each of these subdivisions discriminated again into five classes, according to property solely. To the 350 centuries thus obtained were added 18, appropriated to the knights, next to the senators the wealthiest order in the state. In the assembly the vote of each century was equiponderant; and thus the votes of the four first classes, which, as well as the equestrian, were all filled by men of property, immensely overbalanced those of the fifth, in which alone the mass of the poor citizens was enrolled. The rise of the comitia of the tribes in political importance did little to redress this inequality; for though the distinction into classes did not prevail here, the censors had the power of eliminating the poorest citizens from every other tribe, and confining them

to the four appropriated to the city, which had each only an equal vote with the others, and were appointed to give their votes last. Hence every question was virtually settled, in either comitia, by the suffrages of the first and wealthiest voters. The poorer and more numerous were seldom called upon to exercise their rights at all; and Cicero, indeed, assures us, that in the assembly of the centuries the first, or "*prerogative*," was always found to carry the decision.

Political
History.

The functions of these two assemblies, thus essentially aristocratic, were twofold, elective and legislative. The centuries elected the consuls and prætors, and other principal or *curule* magistrates; the appointment to inferior offices was exercised by the tribes. The power of making laws was claimed equally by both; and in this co-ordinate prerogative, exercised by two assemblies, each comprising the whole body of the citizens, but under a different form and arrangement, consisted one of the most remarkable anomalies of the Roman polity. If a consul, prætor, or dictator had an enactment to propose, he convened the centuries to deliberate upon it; if the measure were patrimonized by a tribune, it was submitted to the popular assembly of the tribes. In either case the law thus passed was binding upon the whole people; but no such law could be initiated by either the centuries or the tribes; every legislative measure must be first promulgated in the Senate, and receive the sanction of that paramount council of state. If a few instances occur of the tribune's proposing to the people a bill for conferring special honour, which the Senate had refused, they must be regarded as acts of irregular encroachment. It would seem, then, that the legislative power of the popular assemblies was that of sanction or rejection rather than of enactment.

The eighteen equestrian centuries comprised the wealthiest classes of the state. Such individuals among them as had attained to magistracies and offices, the exercise of which was generally unrewarded by salaries, and required on the contrary an outlay for the amusement of the populace, which none but the rich could undertake, acquired the title of *nobiles*, together with an inchoate right of admission to the Senate. This illustrious order was opened to the public men who had served certain offices and charges, and was limited to the number of 600. A high standard of property was required of all its members; and this was determined at the quinquennial valuation of the censors, who had the power of revising the roll, striking off the poor and unworthy, and selecting the most distinguished personages to fill their vacancies. The nobles, having once attained the distinction of admission, or merely of eligibility, to the Senate, strained every nerve to maintain this position for themselves and their families, and to keep out from it their inferiors of the equestrian order, who were striving with equal energy to attain it. Hence arose the political conflict of the Senate and the knights, which colours throughout the subsequent history of the free state. The Senate, as the party of the richest and noblest, assumes sometimes the name, as it succeeds to the political character, of the patricians; while the knights, with the names of liberty and equality in their mouths, connect themselves naturally for the most part with the inferior and poorer classes, and occupy the place of the plebeians. But if these old names still occur sometimes in the history of constitutional struggles, it must be remembered how far they have diverged from their original signification.

The struggle for admission to the Senate affected most directly the interests of the competitors. The Senate was the fountain of Roman legislation. The Senate regulated the administration of the provinces, organized the finances of the commonwealth, determined questions of peace and war, and received the ambassadors of foreign potentates. The Senate was the executive of the Roman republic; and to the

Political
History.

Senate, rather than to the people, every magistrate at home and abroad was answerable. If its power was confined by the right of intercession or veto upon its acts appropriated to the tribunes, it had the means of counteracting this opposition by sowing dissensions among them, or, in the last resort, by creating a dictator, with unlimited powers, for the protection of the state. The commons frequently complained, and probably with justice, that the pretence of danger from abroad was often advanced when a dictator was really required to overrule opposition from within. But when the Senate found that the tribunes were manageable without having recourse to this unpalatable expedient, it ceased to invoke the arbitrary powers of a dictator. On more than one occasion it attained the same end less obtrusively by investing the consuls with irresponsible authority to protect the commonwealth. Such a decree, known by the formula, "*Viderent consules ne aliquid detrimenti res publica caperet*," was entitled a *senatus consultum ultimum*. Against this, however, the people had one weapon in store. No citizen could be *capitally* sentenced, that is, to the loss either of life or civil status, without an appeal to the people, or permission to withdraw himself from it by voluntary exile. If the consuls, under whatever authority, violated this constitutional provision, they were themselves liable to sentence at the hands of the comitia of the tribes. The conflicting pretensions of the Senate and the people on this head were never definitively settled, and came more than once into violent collision.

Besides their authority, their influence, and their honourable distinctions, the senators enjoyed a monopoly of the most lucrative government appointments. The missions of pro-consuls and pro-prætors, with their inferior officers, were gilded, not by fixed salaries, but by gifts of states and potentates, and by opportunities, hardly to be resisted, of touching bribes and of peculation. When the rich field of Greece and Asia was opened to their cupidity, the nobles abandoned usury at home and commerce abroad to more vulgar capitalists, and devoted themselves to the provincial administration. They allowed the knights a large share in the occupation of the most fertile domain land, and confined the poorer classes to the common pastures. When the murmurs of these proletaries threatened danger to their privileges, they invented the fatal scheme of satisfying them by a cheap or gratuitous distribution of corn. The corn-growing provinces of Sicily and Africa were mulcted in an annual tribute of grain; and while the hunger of the populace was thus appeased, its passion for amusement was at the same time gratified by shows in the theatre and the circus, provided by the chief magistrates. The exhibition of these shows was found to be a sure source of popularity, and candidates for office vied with one another in thus invoking the favour of the tribes by an ever-increasing profusion. The cost of proceeding through the regular course of honours, of buying the suffrages of the people by shows and largesses, and eventually by direct bribes, for the quæstorship, ædileship, prætorship, and consulship, advanced almost year by year, and by the time that the aspirant had reached the highest object of his ambition, he had impoverished himself, and so obliged himself to his friends and his party, that it was only by the unscrupulous exercise of his advantages in a province that he could hope for indemnification. Hence the province paid eventually for the voluptuous enjoyments of the Roman people.

But the jealous knights, debarred from these guilty gratifications, kept watch over the conduct of the provincial governors, and invoked against them the safeguard of the laws. Murder, bribery, peculation, and corrupt administration of justice were public crimes, the cognisance of which was reserved to the assembly of the tribes, and this assembly was not indisposed to judge severely the crimes

Political
History.

of the nobles and monopolists. The Senate contrived, with admirable dexterity, to escape from this hostile judicature by the appointment, in the year 605 (B.C. 149), of the *quæstiones perpetuæ*, or permanent tribunals, composed solely of members of their own order, for the trial of this class of offences. They turned the flank of the knights, and laughed in the face of the people. The knights gradually recovered from their confusion, faced about, and now directed all their efforts to obtain at least a share in the administration of justice, and so use it as to bring the Senate to terms on the ulterior question of the provincial governments.

SECT. XXIII.—AGRARIAN AGITATION OF THE GRACCHI.

While Rome was subduing her provinces, the provinces were re-acting upon Rome. We have already caught a glimpse of this foreign invasion which was filling Italy with a base mixture of the blood of every conquered nation, and sending myriads of slaves from every quarter of the world to till the fields from which the free native population was carried off by the unceasing drain of war. The legionary, if he survived the long series of distant campaigns from which, while his manly strength endured, he was not permitted to extricate himself, settled for the most part in the countries which had become more familiar to him than his own; while the slave, if attached to the service of a Roman citizen, might hope, after some years of bondage, for personal enfranchisement, and the acquisition of a qualified franchise, and a family settlement in Italy. In the second or third generation the *libertini* of Rome became generally citizens, with the full right of suffrage, property, and marriage. Thus the Roman people, still so entitled, still preserving its political continuity in its rites and traditions, and even in its names (for the freedman entered into the *gens* of his former master, and assumed its name), became from year to year more alien in blood from the genuine stock of Romulus and Quirinus, from the Latins, the Sabines, and the Etruscans of primitive antiquity. Priests and magistrates, to whose vigilant guardianship the purity of the national religion and polity was entrusted, shut their eyes to the revolution thus accomplishing itself; but every now and then an expression or a gesture showed that they were not really blind to its progress, and that in their hearts they despised that scum of nations which had settled on the surface of Roman society. One day, when Scipio Æmilianus was interrupted in the Forum by the clamours of this mongrel populace, he exclaimed, "Silence, false sons of Italy: think ye to scare me with your brandished hands, ye whom I led myself in bonds to Rome!" In this memorable sentence we read the character of the times, and trace the interpretation of much of the history which is to follow.

But though these foreign freedmen succeeded to the votes of the genuine citizens they did not take their place on the soil from which their predecessors had been transplanted. The legionaries had been recruited from the fields, from the small farms of Latium and Sabellia, from the well-tilled allotments of seven jugers (about four acres) to which the plebeian citizen was restricted. But as these modest proprietors were decimated by war, their vacant homesteads were bought up by the capitalists of the city, the knights and senators, and annexed to those wide tracts of public domain which they were permitted to hold rent-free from the state. These possessions, thus greedily appropriated, these *latifundia*, as they were called, were cultivated for the most part by troops of slaves, imported by purchase or as the spoil of war from beyond the sea, chained to their work in the factories, or guarded by armed retainers in the fields by day, and huddled in prison dormitories during the night. Throughout large districts of

Political
History.

Italy, particularly in the south, the free cultivators, or *coloni*, of an earlier period, had almost disappeared, though in other parts they continued still to linger, and wage an unequal struggle for existence with the great landlords and their armies of servile labourers. Thousands of these small proprietors, thus hardly pressed, migrated into the cities, and particularly into Rome, and there mingling with the herd of foreign-born freedmen, maintained themselves by petty merchandize and handicrafts, by the *sportula*, or dole of victuals at the patron's gate, or by the distributions, wholly or in part gratuitous, of bread, oil, and wine, made regularly by the state, and enhanced occasionally by magistrates or candidates for the magistracy.

Tiberius
Gracchus,
A.U. 621,
B.C. 133.

Such was the state of things in Rome and Italy, full of anxiety for the present and fatal warning for the future to the few statesmen who marked the signs of the times, when the young Tiberius Gracchus, a plebeian of the Sempronian gens, well born, and connected through his mother Cornelia with the blood of the Scipios, remarked with dismay, as he traversed the plains of Etruria, the decline of cultivation and the depopulation of the fields and farms. He observed that the slave labour, ruder and more reluctant than the free labour it had supplanted, was less available for the operations of husbandry, which require care and skill, and that large tracts of land once arable had been converted into pasture, and gave employment to a few herdsmen only. Tiberius resolved to restore a Roman population to the territories of Rome. The cause of the evil he deplored seemed to be the extensive occupation of public land by the nobles by an evasion of the limitations of the Licinian law. He persuaded the people to elect him tribune in 621, and exerted himself in that capacity to carry a new agrarian law, more strict and general than those of ancient times, by which the domain of the state should be divided in full ownership among the whole body of citizens, instead of being held in fee by a small and favoured aristocracy. He demanded that the state should assert its ownership of the estates now let at a nominal rent to the nobles, in order to this new distribution. Of this measure, so much debated at the time and since, it may be enough to remark that, in strict law, it was quite constitutional, in equity it was harsh and unjustifiable, while in policy it was totally nugatory. Whatever were the true merits of the question in debate, they were soon lost sight of in the passions of two classes it set in array against each other. The names of patrician and plebeian were now obliterated; the real combatants were the rich and the poor. Many, however, of the rich and noble were found to place themselves, from patriotism or faction, at the head of the commonalty; while the aristocracy of landlords found means to enlist on their side more than one of the tribunes, their natural opponents. It was by this manœuvre that Tiberius was ultimately baffled. Though he succeeded in getting his measure passed, under the pressure of the popular enthusiasm, he was not allowed to put it himself in operation: on attempting to exercise the powers he had reserved himself for allotting the lands he had acquired for the people, he was confronted by one of his colleagues named Octavius, accused to his own party of aspiring to the tyranny, and in the course of the tumults which ensued overpowered and slain. Three hundred of his followers fell with him in the affray. This, it was said, was the first blood shed at Rome in a popular tumult.

The leaders, however, of the popular movement, though stunned for the moment, were not discomfited. They formed an alliance with the Italians, who were excluded from the franchise of Rome, and engaged to aid them in suing for the boon of citizenship. Caius, the younger brother of Tiberius Gracchus, took the lead of this combined party. Scipio Æmilianus, twice consul, and a chief of the oligarchy, stepped boldly forward and undertook to

Caius
Gracchus,
A.U. 133,
B.C. 121.

advocate the claims of the Italians; but this redoubted champion was found soon afterwards dead in his bed, and it was natural to believe that the nobles had procured his assassination. Caius was got rid of for a time by an appointment beyond the sea. Fregellæ, an Italian town, thinking its cause abandoned, rushed desperately to arms, but was worsted and sacked by the consul Opimius. Caius now, feeling that he had been cajoled, hastened back to Rome and secured his election to the tribuneship, from which ground of vantage he aimed some hard blows against the most eminent of his opponents, protected his own partisans, founded colonies, and executed great public works. He was the delight and pride of the citizens. His eloquence was not less popular than his manners and his policy. He caused the position of the rostrum, from which the orators harangued the people in the Forum, to be changed, so that the speaker should no longer turn towards the comitum, the place of the patrician curies, but towards the masses of the commons stationed in the opposite quarter. He raised the knights to a share in the *judicia* or tribunals; he strove to extort the franchise for the Italians. The object of this bold demagogue's reforms was the exaltation of the commons into a distinct community, rather than the fusion of the nobles and the commons in a single body,—such at least was the judgment passed upon them by public writers, who affirmed that Caius made the commonwealth “double-headed.” At any rate, his efforts, though but partially successful, led to a severance in public feeling which precipitated a general commotion; and he fell himself prematurely, as soon as he had finished his year of office, in a tumult which he had himself unwarily excited. The Romans long continued to honour the memory of the Gracchi as the ablest of the early chiefs of the democracy, and erected statues to them, and altars on the spots where they had fallen. Yet the prejudices of the nobles prevailed in the long run, and in the great body of Roman literature the Gracchi are represented to us as the eponyms of factious ambition, rather than of patriotic policy. Cornelia, the mother of the ill-fated tribunes, obtained a purer fame, and continued to be remembered among the most honoured matrons of the republic. Opimius, having obtained a second triumph over the disturbers of his faction's supremacy, erected a temple to concord in arrogant imitation of Camillus, the second founder of Rome. In the course of the next fifteen years the nobles, now unchecked, effected the formal repeal of the measures of the Gracchi. The knights were expelled from the tribunals; the lands remained in the occupation of the rich lords; the Italians were left beyond the pale of the Roman franchise; finally, the aid of the censors was invoked to expunge from the list of knights and senators all those members of either class who were suspected of leaning towards a reform of the constitution.

Political
History.

SECT. XXIV.—WARS WITH JUGURTHA AND THE CIMBRI, AND POPULAR ASCENDANCY OF MARIUS.

Meanwhile the kingdom of Masinissa, which he had held as a dependent upon Rome, had been divided on the death of his demise between his three sons, and again, on the death of two of these, had coalesced into a single sovereignty. Micipsa, the survivor, proposed to divide his dominions between his two legitimate children; but a natural son named Jugurtha, more able than either, and trained under Roman generals in Spain, intrigued for the succession, assassinated one of the princes, defeated the other, and hastened in person to Rome to engage its sanction to his usurpation. The Senate repulsed him; but on his return home he boldly took up arms and defended himself by force, with the full support of his countrymen, against the best captains of the republic. Metellus, a chief of the Optimates, reduced him to great straits, but he extricated himself again with won-

Political
History.

derful ability. This war, long protracted with various success, brought forward the remarkable talents of C. Marius, a soldier who rose from the ranks to the consulship, and was sent with the acclamations of the popular party, whose child and champion he proclaimed himself, to bring the struggle to a termination. The Numidian chieftain was thus at last driven to bay, and captured by the dashing exploit of an enterprising young officer, Cornelius Sulla, and carried to Rome. There he followed the triumph of Marius in the year 650, and was cruelly put to death. Numidia was divided into three portions: the western part was annexed to Mauretania, the realm of Bocchus, who had proved himself a faithful ally; the eastern was united to the Roman province of Africa; the remnant of the ancient kingdom was allotted to two princes of Masinissa's family, through whose feuds the republic might hope to secure its own supremacy over both.

Marius triumphs over Jugurtha, A.U. 650, B.C. 104.

The perils of the great Jugurthine war were long celebrated by the Romans, and furnished a theme for one of their masterpieces in historical composition. We may regret that we have no Sallust to recount for us the still more terrible struggle of Rome with the Cimbri and Teutones, in which the services of Marius were even more transcendent. The republic had first interfered in the affairs of Massilia, a Greek commercial city on the Gallic coast of the Mediterranean, in the year 600, when she wrested some territories from the barbarians at the request of that unwarlike community, and bestowed them upon it. In 629 she undertook a campaign against the tribes of the lower Alps, and founded the Roman colony of Aquæ Sextiæ (Aix), at the same time making a further addition to the realm of her Grecian clients. Further complications with the Gaulish states speedily ensued. The Romans won a great battle over the Arverni and Allobroges in 623; and in a short time the south-western corner of Gaul, beyond the Alps, was become a Roman acquisition, and received the special designation of "the Province." Roads were now constructed across the Alps, and the dominions of the republic advanced to Narbo, beyond the Alps, and Tolosa, on the Garonne. While, however, the Transalpine province was thus growing and flourishing, it was well nigh overwhelmed

by a terrible disaster. Tribes sprung from the remotest parts of Germany, known to Roman writers by the name of Cimbri and Teutones, poured with an armed immigration towards the northern portions of the Roman empire. On the eastern side of the Alps they were repulsed, by treachery rather than by arms, by Papirius Carbo; but they swept round the skirts of the mountain barrier, and appeared again on the Rhone and the Isère, spreading fire and devastation in the Roman province, and threatening now to scale the western Alps, and thence descend into Italy. Five consular armies were sent against them, and suffered five defeats, each more terrible than the last. Rome was in consternation, but breathing-time was afforded by a diversion of the main body of the barbarians into Spain. Marius was hastily recalled from Africa, before the final completion of the Jugurthine war, and the peril of the crisis compelled the nobles to allow of his election again and again to the consulship, till he had succeeded in arresting and finally crushing this formidable onslaught. Marius gained the great victory of Aquæ Sextiæ in 650, in which he destroyed the Teutonic division of the enemy; he then hastened into Italy, whither another swarm had already penetrated, and overwhelmed the Cimbrian invaders with a second and not less complete success at Vercellæ, in the following year. By the time he found leisure to return to Rome, he had enjoyed in succession the unprecedented number of five consulships.

Battle of Aquæ Sextiæ, A.U. 652, B.C. 102.

The disasters of foreign war had been aggravated by a servile insurrection in Italy itself, and the necessities of the state had compelled the nobles to relax their hold on the privileges they so jealously maintained. A tribune named

Domitius had wrested the appointment of chief pontiff from the priests' college, a body highly aristocratic, and had given it to the people. This afforded them important protection against an unfair exercise of the political instrument which called itself the national religion. Another tribune, Servilius Glaucia, restored once more the *judicia* to the knights. Marius, though himself no party politician, and with motives merely personal, was put forward by the popular faction as their champion, and raised to a sixth consulship in 694. His election had been carried by intimidation and the threats of his licentious soldiery, whom he had enlisted for the first time, under the pressure of public calamity, from the Proletarii, the rabble of the Roman people. His measures were as violent as his manners were unpolished. He ventured so far to stretch the prerogative of his office as to confer the franchise on a thousand of his soldiers levied in an Italian municipium; and when remonstrated with on the illegality of the act, coolly replied, "amid the din of arms I could not hear the voice of the laws." Backed by the tribune Saturninus, he continued to reward his rude warriors with the boon of citizenship, and quartered many thousands of them on the lands belonging to the colonists in the province, which he had rescued, as he boasted, from the hands of the barbarians. The nobles resented these irregular proceedings, and tried to interrupt the assemblies convened to sanction them, by alleging the frivolous omens, such as rain or thunder, which were allowed to dissolve the comitia. "Be still," cried Saturninus, "or it shall presently hail." Tumult ensued in the city; the tribunes gained the upper hand, and drove Metellus, the chief of the nobles, into banishment. Saturninus continued to maintain his influence over the people, and the Italians, it is said, offered him kingly authority. But the nobles were still the stronger party when they acted together with vigour, and under the leadership of Memmius, Marius at this time shrinking from the furious violence of his late adherent, drove the tribune out of the Forum into the Capitol. There Saturninus defended himself with arms; but the notion that he aimed at the tyranny was circulated among the people, and, whether it were true or false, it sufficed to turn their feelings against him. The water-pipes that supplied his fortress were cut, and he was forced to descend from it. Marius indeed guaranteed him his life; but the people were not to be controlled: they forced themselves into the hall in which he had taken refuge, and slew him, with the remnant of his followers.

Political
History

Overthrow of Saturninus, A.U. 654, B.C. 100.

This was perhaps the last moment at which the establishment of a limited and constitutional monarchy, the dream of Scipio and the regret of Cicero, might have been possible at Rome. Had the popular faction possessed among them a man of enlightened integrity as well as of ability, in whose favour they could have agreed to exercise the power which had exalted Marius to six successive consulships, and had given authority in periods of public emergency to the tribunes of the last few years,—had the nobles been directed by men of sense and patriotism, to yield to the just claims of their own commons and of the Italians,—the usurpation, fifty years later, of Cæsar and Octavius might have been anticipated under happier auspices. The mass of the citizens was still sound at heart, and not incapable of the self-control required for the due exercise of high political rights. While it placed all private ambition under the check of a sovereign authority, it might still have kept a check on the sovereign himself by its own firmness and moderation. Public virtue, indeed, could not have been maintained without recognising on a wider scale the proper claims of humanity, without renouncing the hateful privileges then generally accorded by the conqueror over his subjects, and the master over his slaves. But neither the philosophy nor the religion of the day set forth any principles of action adequate to commend such an apparent

Political
History.

sacrifice; and it must be confessed that the elements of a secure and tranquil government by a limited kingly power were hardly to be found at this time throughout the heathen world. We shall presently see that neither the aristocracy nor the democracy of Rome was capable of maintaining the equilibrium of the commonwealth, and that the unmitigated despotism under which she ultimately fell was the only possible solution of the antagonism so long prevailing in the elements of her polity.

SECT. XXV.—THE SOCIAL WAR.

The Ital-
ians agi-
tate for ad-
mission to
the Roman
franchise.

For some time past the Italians, as we have observed, had been putting forth claims to the Roman franchise. If we would analyse, in a small compass, the motives from which this pretension was generally urged, we must reject, in the first instance, the notion, so natural to our modern ideas, of equity and inherent rights. "Rome for the Roman"—the enjoyment, that is, by the conquerors of all the fruits of conquest—was the fundamental principle of Roman policy, the moral basis of which was unquestioned by any subjects or dependants of the republic. If, under any circumstances, she relaxed from this primary idea of her government, even the states she favoured would only regard it as a concession extorted by some necessity of the moment, which it would have been preposterous to claim as a right. The road to Roman honours and magistracies might have charms for a few distinguished personages in an Italian burgh, but to the population generally the Roman franchise offered, for a long period, few attractions. The severe discipline to which the Roman commons were subjected, the constant military service demanded of them, the harsh prohibition which long prevailed of the exercise of trade and arts, the jealousy with which the avenues to office were guarded, must have rendered the exchange of country (for the Italian who acquired the Roman franchise lost his own) a very slender gratification to the multitude. There was, indeed, some immunity in matter of taxation to be set against these drawbacks; but the advantages to be derived from a share in the provincial administration were confined to a small class, and could hardly be accessible to a "new man" from Italy. The pressing motive which inspired the cry now raised for this questionable privilege was suggested by the agrarian struggles of the Gracchi. The public domain within the peninsula being now occupied chiefly, as we have seen, by noble landholders, was sublet by them to the natives. The Italians, deprived of the legal possession of their own soil by the conquest, became virtually re-possessed of it by the mere abuse of proprietary right, which allowed a few great families to enjoy the usufruct of the national territory. But from the strict division of this territory among the citizens, as demanded by the leaders of the movement, it would result that the Italian sub-tenant would be ejected from his farm to make way for a plebeian proprietor. The measures threatened by the Gracchi were really more formidable to the Italian than to the Roman aristocrat himself. They touched the pride and the privilege of the latter; but they menaced the means of existence of the former. It was open to the Italian either to join with the nobles in resisting the claim of the people, or to urge his own admission to the franchise, and so come in for share with the people in a new distribution of property. This latter course was that which he adopted; and probably it was the most sagacious. The leaders of the plebeian agitation found themselves at the same time leaders of an Italian agitation also; the two movements proceeded together, and during the external troubles of the republic were suspended together. When security was restored from without, the cry of the Italians rose louder than ever; and it was plain that the next great struggle of the governing classes at Rome would be against

Political
History.

the intrusion of their own subjects within the pale of Roman property and privilege. But the knights availed themselves of this foreign aid in their contest with the Senate; and thus the noble party, the Optimates as they were called, found themselves arrayed against the widest and most formidable coalition they had yet encountered, in defence of their prerogative.

The strength of the Optimates, sapped and battered as it was, still lay in the remnant they had preserved of their old control of the state religion, by which they could at times make an effective appeal to popular interests and prejudices; but more in their own military organization, and the well-trained bands of clients and retainers, trained to the use of their suffrage as well as of their arms. They effected the disgrace of Marius and the recall of Metellus; and in 659 (B.C. 95) required the consuls to expel from the city all the Italians who had sought a domicile within its walls. The Italian faction was now headed by a tribune named Livius Drusus, one of the most popular of the demagogues, of whom it was long remembered that, when his architect proposed to build him a house in which he might screen himself from the observation of his neighbours, "Build it so," he had answered, "that every citizen may witness every action I perform." The labours of this man in the cause of Italian emancipation seemed approaching to success when, in the midst of the struggle, he was suddenly struck down by the poniard of an unknown assassin. The nobles, and especially the consul Philippus, incurred the odium of the deed.

Livius
Drusus,
tribune,
A.D. 663,
B.C. 91.

Measures of proscription against individuals were now threatened and carried alternately on both sides; but all semblance of legal procedure was soon cast away, and the Italians rushed to arms. Their forces were derived chiefly from the Marsians, the Picentines, the Vestines, the Samnites, the Lucanians, and Apulians; and thus the allies of the Roman state, as they were specially denominated, became its open and avowed enemies. In the course of the campaigns which followed, the Etruscans also joined the coalition; and the object of the war, which was at first the acquisition of the Roman franchise, became no other than the extermination of the Roman republic. It was proposed to organize and maintain a great Italian confederacy, of which Corfinium, under the name of Italica, should be recognised as the capital. On the Roman side the names of Cæsar, Crassus, and Pompeius, destined to re-appear in the next age in fatal combination, obtained their earliest illustration; on the Italian, Judacilius, Pompædius, and Motulus were the most distinguished leaders. The chief successes of the Romans were gained by Marius and his former lieutenant Sulla, who crushed and, as it was said, destroyed the Etruscans; nevertheless, the power of the republic would not have sufficed for the complete reduction of the insurgents, and the discretion which, at the first turn of fortune in her favour, dictated a substantial concession, saved her from an exhaustion of blood and treasure which no barren victory could have compensated.

The *lex Julia* conferred the franchise on the Umbrians and Etruscans in 664; the *lex Plautia Papiria* in 666 extended it to all their Italian allies. Every Italian who chose to come to Rome and claim the boon within sixty days, was received into the bosom of the commonwealth. Ten tribes were added to the thirty-five already existing. The boon after all was not very generally accepted. The Roman religion required that every legal measure should be sanctioned by certain ceremonial observances, and these could only be transacted within the sacred precincts of the city. It was admitted on all sides that the suffrage could only be exercised at Rome. Accordingly the franchise offered little attraction to distant citizens, who were required to forego their local citizenship for a privilege which they had little opportunity of exercising. After all

citizenship

Political History.

the blood which had been spilt in the struggle, the Italians found themselves content for the most part to retain their old position. The roll of the Roman citizens, which in the census of 640 numbered 394,336, in that of 668, the next of which we have the account, had not increased beyond 463,000, and sixteen years later was only 450,000. But the precedent now set for the first time on so large a scale bore ample fruit in the course of Roman history. The full franchise was conceded in special instances to various states in Spain, Gaul, and Africa; while the Latin, which conferred, as we have seen, a certain eligibility to the Roman, was even more widely diffused. Pompeius Strabo extended it to the entire nation of the Transpadane Gauls. On the whole, the liberal concessions of this period evince in a marked manner the prudence of the Roman government at one of the most perilous moments of its career. The strong national prejudice against which they were carried was now finally overthrown, and the Roman writers uniformly agree in applauding the policy which dictated them, and ascribing to it the preservation of the state at the time, and the unabated vigour of its subsequent progress.

SECT. XXVI.—MARIUS AND SULLA—THE FIRST CIVIL WAR.

Contest of Marius and Sulla.

At a critical period of the late war Marius, in a splenetic mood, had quitted the camp and buried himself in a distant retreat, leaving Sulla as consul, in 666, to bring the contest to a close. The younger champion was now in the ascendant. Mithridates, King of Pontus, had defied the republic, had overrun the province of Asia, and caused the massacre of the Roman colonists and traders, amounting, as was loudly proclaimed, to not less than 80,000 souls. Sulla was appointed to carry on the war against this formidable enemy; but before he could set forth on his mission, Marius, alarmed for his own pre-eminence in public affairs, attempted to create a revolution in the city. Sulla recalled his troops, which had not yet quitted Italy, drove before him the Marian forces, and entered Rome in military array. Marius, flying for his life, concealed himself in the marshes of Minturnæ. He was discovered and seized; but the Cimbric captive who was sent to despatch him in prison, fled in terror from before him, and he was allowed to escape once more, and make his way into Africa. Reclining among the ruins of Carthage, he meditated the recovery of his power. On Sulla's departure for the East, the Marian faction again made head under Cinna, but was put down again by the Senate and the consul Octavius. Cinna fled into lower Italy, and raised some levies of turbulent banditti. At the same time Marius re-appeared suddenly in Etruria, and both chiefs approached Rome simultaneously from opposite quarters. They entered the city, overcoming all resistance, and executed a sanguinary proscription of their enemies. Marius became consul for the seventh time in 668, and though now seventy years of age, prepared to lead an army into Asia to supplant his rival Sulla. At this crisis, however, the old man died suddenly. Cinna succeeded to his power, and sent Valerius Flaccus to assume the command of the Roman forces in the East. Scarcely had Flaccus crossed the Hellespont when he was assassinated in the camp by one of his own officers. Sulla was enabled, by the ascendancy of his character, to join the legions of Flaccus to his own, and, thus re-inforced, put Mithridates to the rout, and led his combined forces against the enemies of the Senate at Rome. Cinna had now been murdered in his turn. Carbo and a son of Marius were the chiefs of the popular faction, but they could make no head against the military talents and the veteran legions of Sulla. In the battle of Sacriportus, and again before the Colline gate of Rome, the Italian militia who supported them went down before the conquerors of Mithridates. The senatorial party received

Death of Marius, A.U. 668, B.C. 86.

their avenger with exultation, not unmixed perhaps with fear, and stood horror-stricken by his side while he did bloody and remorseless execution on the abettors of the late revolution. Sulla massacred several thousands of his disarmed prisoners in the Campus Martius, and organized a system of terror and proscription for the extirpation of the popular leaders.

Political History
Victory of Sulla, A.U. 672, B.C. 82

It still remained to re-establish the supremacy of the nobles on a legal basis, and to this purpose the conqueror now applied the powers of the dictatorship which was now conferred upon him without limitation of time. He was even allowed to retain it, together with the consulship, in the year 674.

Rome had hitherto been peculiarly fortunate in her political revolutions. With whatever violence they might have been conducted, they had perhaps uniformly worked for her ultimate advantage. But this was because they were all the offspring of a natural progress in the life of the people. The re-actionary system of Sulla was, on the contrary, the greatest disaster in her annals. The aim of this despot was to undo all the popular measures of the last half-century; to check the progress of agrarian distributions; to suspend the plantation of colonies; to thwart, if he could not abrogate, the late enactments for the enfranchisement of the Italians; to destroy the popular authority of the tribunes; to repel the knights from the *judicia*; to reserve the government of the provinces, with all the advantages thence accruing, for the first estate, the senatorial families only. The utter prostration of the opposite party enabled him to carry out all these plans for the moment, and the high character borne by some of his coadjutors, such as Catulus, contributed to render them palatable. The opening career of the young Cnæus Pompeius, the bravest of his lieutenants, whom he had seduced from the politics of his family and placed in the first rank of the senatorial partizans, augured brilliantly for the military triumphs of the faction to which he devoted him. Having effected the reforms he judged necessary for his views, filled the city and magistracy with his friends and the provincial governments with his creatures; having attained, for his uniform successes, the surname of *Felix*, "the Prosperous" from an admiring generation, Sulla ventured to resign his dictatorship, and retired abruptly into private life. His good fortune still befriended him: none of his enemies, no friend of his slaughtered victims, molested him in his defenceless retreat; and he died in his bed, though harassed indeed by a loathsome infirmity, in the year 676, at the age of sixty.

his death, A.U. 676, B.C. 78.

SECT. XXVII.—RE-ACTION AGAINST SULLA'S OLIGARCHICAL CONSTITUTION.

The establishment of the Sullan oligarchy was a severe blow to the ambition of large classes at home, to the knights and other *new men* who were striving by their wealth, or their credit in the courts and the Forum, to thrust themselves into public office, for which they had no claim from birth or family illustration. It was an attempt to restrict to a group of two or three hundred ancient houses the honours and emoluments of the government of the world. The time, indeed, was past when such a retrograde step could be permanent; but in the meanwhile the provincials were even greater sufferers than the citizens themselves. Great as had been the cruelty and oppression of the governors, their subjects had hitherto had a remedy in the appeal to the tribunals at Rome, to the judges of peculation and extortion. This appeal, however, would have been of little service but for the jealousy of parties in the city. As long as the knights contended with the senators for the *judicia*, and the Marians with the nobles for the magistracies, advocates might be found, and the machinery, how-

Sufferings and complaints of the provincials.

Political
History.

ever imperfect, of Roman justice might be employed for redress. Proconsuls charged with extortion towards their subjects might sometimes meet with punishment, as well as those whose crimes had been committed against the state itself. But when the *judicia* were restored wholly to the Senate, when the popular leaders were utterly silenced, the magistrates enjoyed, at least for a moment, complete impunity, and the provincials found, whatever their sufferings, that redress from a senatorial tribunal had become entirely hopeless.

It was fortunate for the subjects of Rome that the rampant supremacy of the Sullan oligarchy could not long be maintained against the numbers, the activity, and the skill of the party over which it had triumphed. The complaints of the oppressed were encouraged by the chiefs of the opposition, and all the force of forensic eloquence was employed to bring the oppressors to justice. The judges were more accessible to bribery than to eloquence; but by means of the one or the other many of the Optimates were thus smitten with judicial sentences, while the feelings of the public were roused against them, and a strong prejudice excited against the monopoly of power which they so fearfully abused. The case of Verres, the plunderer of Sicily, and of other provinces before, who was dragged at last before the bar of justice by the youthful orator Cicero, and forced to abandon his defence in despair, shook the authority of the nobles, while it vindicated in one conspicuous instance the rights of the subject provincials.

Sertorius.

C. Pompeius, sur-
named
"Magnus."Revolt of
Spartacus.

But the Marians were not satisfied with these legitimate modes of warfare. Immediately on the decease of Sulla, Lepidus, then actually one of the consuls, took up arms ostensibly in their interest, but was put down by his colleague Catulus. A remnant of the party, turbulent and self-willed, and impatient of their loss of power, attached themselves to an Italian officer named Sertorius, who raised a revolt in Spain, and maintained a war there for several years against the best generals of the Senate. After defeating Metellus, he kept the brave Pompeius at bay till he was murdered, in 682, by Perperna, one of his own lieutenants, after which event the movement was quickly suppressed. This was another great service done to the state by one who was now acknowledged by the nobles as the foremost man in the republic. The title of *Magnus* ("the Great"), with which Sulla in his lofty generosity had already saluted him, was ratified by the consent of the dictator's faction, and recommended by them to the general approval of the citizens. The popular party were indeed not without hopes of gaining him to their own side. Flattered on all hands, he trimmed from side to side, and his estimation still rose higher as fortune gave him opportunities of distinction. He was still absent in Spain when Rome was terrified by the revolt of Spartacus and a handful of fugitive gladiators, soon swelled to an army by opening the *ergastula*, or slave-prisons. More than one legionary force was defeated by them: they were checked at last and crippled by Crassus; but by this time Pompeius had been recalled in haste to combat them, and his opportune arrival completed their discomfiture, while it earned him the whole glory of the victory (A.U. 683, B.C. 71). Such was the favour in which this lucky general was now held that he could lend a helping-hand to Crassus, and raise him together with himself to the consulship; an act of condescension of which his colleague ever retained an uneasy recollection. Courted by both parties, the two consuls combined in their policy, and exerted their authority on the side of the Marians. They restored the tribuneship, and transferred the *judicia* to the knights; and thus the chief measures of Sulla were abrogated by the leaders he had left behind him, after only eleven years' continuance. The consuls were supported in their reforms by the talents of

the rising orator Cicero, who formed in his own mind an ideal, too bright for realization, of the harmonious co-operation of all classes in the state, and strove to secure for the second order its fair share in the administration, notwithstanding the selfish resistance of an unconquitable oligarchy.

During the last few years a fresh war had been in progress with the indomitable King of Pontus. The Roman armies were led by Licinius Lucullus, an able commander, but not vigorous enough to cope with the vast resources and energy of Mithridates. While the republic was drained of men and treasure in this unprofitable warfare, it was still more painfully harassed by the pirates of Cilicia, who, since the decline of the Greek maritime powers, had covered the eastern Mediterranean with their vessels, and carried their predatory enterprises to the coasts of Italy, and even to the Pillars of Hercules. It was necessary to make an effort to suppress them, and powers such as had never before been conferred on a single commander at Rome were given to Pompeius by the Gabinian bill for the purpose. He was constituted captain-general of all the forces of the republic throughout all her coasts, and fifty miles inland. Such a command was practically unlimited; such a commander was virtually the autocrat of the empire. Nevertheless the result, complete and speedy as it was, seemed fully to justify it. The naval campaign, in which Pompeius collected all the maritime resources of the republic and her dependencies, overcame the pirates from sea to sea, and at last crushed them in their own harbours, was an achievement as brilliant as it

Political
History.Pompeius
overcomes
the Cilician
pirates.

was unique. Its effect also was permanent: from henceforth the police of the seas was kept so well by Rome that piracy never made head again in the Mediterranean during the existence of her dominion. But while Pompeius was thus gaining the most honourable of his distinctions, the "pauic laurel," one of his creatures in the city, named Manilius, took advantage of his increasing popularity to obtain for him the command against Mithridates (A.U. 688, B.C. 66), and over the eastern half of the empire. This enormous grant, far exceeding the powers ever before confided to a proconsul, was advocated by all the eloquence of Cicero; and Lucullus was directed to resign his command to the favourite of the people, and return as a private citizen to Rome. Lucullus was one of the chiefs of the oligarchy; and this insult to the individual was felt more acutely by his party than by himself, for by temper he was unusually indifferent to public distinctions, and betrayed at least no annoyance when on his return he withdrew himself from affairs, and gave his leisure to the enjoyment of luxury, and to private works of munificence. But the jealousy with which the Senate had begun to regard their pretended champion Pompeius was much exasperated: he repaid their suspicions with haughty scorn, while the chiefs of the opposite party fanned the flame of discord between them. Cicero rose into distinction with the general favour bestowed upon his patron. In the year 688 he was chosen prætor, having already served the lower magistracies; and now in the full career of honours, he might well hope, new man though he was, without fortune or connections of his own, for the crowning glory of the consulship.

The nobles loudly asserted that their champion Lucullus had already broken the power of Mithridates, when Pompeius was thrust forward to reap the honour of his successes. Certain it is that the King of Pontus sued for peace on the first arrival of his new antagonist; but it was not the object of Pompeius to gain a bloodless triumph, and he refused to treat with the enemy till he had reduced him to unconditional submission. Mithridates withdrew from Asia Minor, but he retired through the difficult country of Iberia and Albania to his dominions in the Tauric Chersonese, and thither Pompeius tried in vain to follow him. Some poli-

Triumphs of Pompeius in the East.

tical complications occurring seasonably in Syria, the baffled Roman made them an excuse for desisting from the pursuit; and turning southward, he arranged the affairs of the province, and decided between the claims of rival pretenders in Palestine. Pompeius was the first Roman that entered Jerusalem, where he penetrated into the Temple, and even into the Holy of Holies. Meanwhile Mithridates fell by private treachery in 691, being slain by one of his own sons, Pharnaces, who obtained in recompense a confirmation by Pompeius of his claims to the throne of the Bosphorus. On the eastern frontier of Asia Minor, Cappadocia, Paphlagonia, Galatia, and Comana were formed into dependent sovereignties; their territories were declared free states in the centre of the Roman provinces; but the greater portion of the peninsula, including also Syria, was definitively annexed to the empire. Palestine became a vassal monarchy under the Herods. Beyond the Euphrates, Armenia still retained a nominal independence; but the efforts of Rome were constantly directed to preventing her from falling under the sway or influence of the Parthians. Pompeius the Great, the conqueror and organizer of the East, might regard himself in either capacity as the rival of the great Alexander.

turn he found his friends once more drawing breath and recovering their spirits, he had thrown himself manfully into their cause, and insisted on restoring the trophies of Marius, displaced by his successful enemy. During the absence of Pompeius he pushed himself with undaunted energy into the first rank of the popular faction; he dismayed the nobles by calling to account the instruments of Sulla's vengeance, and by inciting the people to inflict a public slight upon Catulus. The Optimates were already tottering under the repeated blows he thus dealt them, when an event occurred which gave them an opportunity of strengthening their position. Suddenly the commonwealth was threatened with a ruinous disaster. Fortune gave the nobles the means of averting it by an act of extraordinary vigour, and recovering thereby the prestige which a series of weaknesses and defects had well nigh lost them. The conspiracy of Catilina and the courage of Cicero gave the Senate another lease of power for fourteen years.

The conspiracy of Catilina, A.U. 691, B.C. 63.

SECT. XXVIII.—REVIVED AUTHORITY OF THE SENATE DURING THE ABSENCE OF POMPEIUS.

Revived authority of the Senate during the absence of Pompeius.

During the absence of Pompeius in Asia the extreme section of the senatorial party, well pleased at the removal of a champion they suspected and feared to so distant an exile, placed themselves under the guidance of their natural chiefs, men of ancient lineage and ancestral honours, such as Catulus, Lucullus, Servilius, Lentulus, and Marcellus. But none of these were men of commanding ability, nor even of commanding energy. A large number of the principal nobility were engrossed by luxury and indolence; and the eloquence of Hortensius, their best speaker, was speedily eclipsed by that of the upstart Cicero. In this dearth of talent among them, they suffered a prominent place to be taken by Cato, the great-grandson of the censor, a man who resembled his illustrious ancestor in the antique rigour of his manners, a pedantic assessor of the old senatorial privileges, and inflexible in the maintenance of his hereditary politics. This dogged resolution and dense obstructiveness were as valuable qualities perhaps as a chief of the Optimates could at that time possess; for Cato knew how to keep his position by sheer obstinacy long after a reasonable statesman would have confessed that it was untenable, and he protracted the contest with the ever-increasing power of the popular faction through many a vicissitude of triumph and defeat, as accident favoured or depressed him. But fortune was on the whole against him; and the chance which arrayed the unequalled genius of C. Julius Cæsar in the first rank of his opponents, was alone sufficient to overwhelm the resistance of abler men than Cato.

M. Porcius Cato.

C. Julius Cæsar.

Cæsar was descended from a noble family, sprung, as is pretended, even from a Trojan origin. His ancestors had enjoyed the highest honours of the state, and were naturally attached to the party of the Senate which some of them had defended in arms during the Social and Civil wars. But he was at the same time nephew to Marius, and he had married a daughter of Cinna. These connections outweighed in his mind the prejudices of his birth, and inspired him with the ambition of ruling Rome at the head of the democracy. In early youth he had been marked out by Sulla as the heir of his rival's principles, and a possible successor to his own ascendancy. Cæsar had escaped the proscription of his party, had served abroad while it was dangerous to appear in Rome; and when on his re-

Amid the contests of ostensible parties in the state there lurked a greater and nearer danger in the numbers of discontented bankrupt youths thrown loose upon society by the accidents of civil commotion. These pests of the commonwealth fell at this moment under the lead of a profligate monster, L. Sergius Catilina, who, having failed of his election to the consulship, intrigued against all constituted authority, and formed a conspiracy to seize the government by force. The existence of such a plot had been vaguely apprehended from the moment of Catilina's defeat, and it was with the presentiment that a man of vigour would be required at the helm that the nobles, notwithstanding his ignoble birth, allowed the election of Cicero, whose abilities they knew, and on whose vanity they could play, to the consulship for 691. Cicero soon made himself master of the plot, surprised certain envoys from the Allobroges with whom the traitors had been tampering; but not daring to seize the chief conspirator himself till he could make his guilt patent to the citizens, denounced him in the Senate-house, and drove him in guilty agitation from the city. Catilina threw himself prematurely on the feeble levies he had prepared in Etruria; while the consul arrested his chief adherents, some of them men of rank and distinction, strangely mixed up in so desperate an enterprise, brought them before the Senate, disclosed their guilt by incontrovertible proofs, and demanded their punishment. The temper of the people, it seems, could not be trusted; and notwithstanding the enormity of the guilt thus fastened upon them, it was dangerous to allow them the appeal which the law permitted. The nobles were well pleased at the opportunity of showing their confidence in their own power, and proving that they were not afraid to act with the vigour of the ancient oligarchy, even in the absence of Pompeius and his legions. They had armed the consul with the "ultimate decree," requiring him to provide, by whatever arbitrary measures, for the safety of the state; and this stretch of their prerogative they did not scruple to enforce with the instant execution of the criminals. Cicero was hurried along by his enthusiasm, as the saviour, for such he was loudly proclaimed, of his country. He lent himself to the rash policy of his supporters and patrons; dazzled by the splendour of his extraordinary position, intoxicated by the incense of aristocratic flattery, and the assurance that he had secured a permanent rank among the haughty oligarchy of Rome, he consented to an act of dubious justice and expediency, of which he had cause bitterly to repent not many years after. The presumed associates of Catilina, whose actual guilt is affirmed only on *ex parte* evidence, were strangled in prison; Catilina himself, brought to bay in the Apennines, was defeated in open battle by the forces of the government, and slain, fighting bravely in the field.

SECT. XXIX.—COALITION OF POMPEIUS, CRASSUS, AND
CÆSAR TO CONTROL THE GOVERNMENT—THE FIRST TRI-
UMVIRATE.

Rise and
progress of
Cæsar.

Cæsar, as the chief of the popular party, the representative of its constitutional traditions, had protested against the infliction of capital punishment on the conspirators. It required great courage to take this part; for the nobles had tried to incriminate Cæsar himself in the plot, and he had with difficulty extricated himself from their meshes. Such, moreover, was the influence they had now acquired over the passions of the knights and men of property in the city, that he was threatened by their poniards on the steps of the Senate-house. But the reckless populace whom he swayed with a handful of trusty adherents, by unbounded profusion of money, reigned in the comitia. He was chosen prætor and chief pontiff; and in the year 693 went forth, with money borrowed from Crassus, to gain his first laurels as a governor in the further Spain. Pompeius, returning this year, found himself the object of jealousy, not unmingled with scorn, to his own party, elated as they were by their recent triumph, and believing themselves strong enough to cast off his odious patronage. On reaching the shores of Italy, such was his confidence in himself, and in the position he supposed himself to hold, that he magnanimously disbanded his army, and took his seat as a private citizen in the Senate. But this moderation served only to confirm the short-sighted vanity of the Optimates. They amused themselves by treating him with the most marked coldness, kept him waiting a year for the triumph he had so well earned, and put off from day to day the ordinary compliment of ratifying his acts or political arrangements in the East. Upon this point, indeed, he could get no satisfaction till he had formed a coalition with Cæsar and Crassus, by which they entered into a mutual pledge to support each other's pretensions to the highest offices and commands, and to share, in fact, between themselves the actual government of the state. Cæsar was suing for the consulship; Crassus was desirous of some lucrative command; Pompeius, who had attained the summit of his ambition, wanted only the confirmation of his acts, the reward of his legionaries, and the solemn recognition of his pre-eminent deserts. He felt as yet no jealousy of his associates; the one he regarded as a fashionable debauchee and spendthrift, the other as a selfish and indolent miser. He hoped to use them both as the props of his own supremacy, and to cast them away whenever he had recovered that authority with the nobles which he considered due to his merits, whatever attitude he might assume towards them. Such was the origin of the compact of three private citizens for the control of the republic, known by the name of the First Triumvirate, the fruits of which were soon seen in the success of Cæsar's application for the consulship, and in the bold popular measures he was enabled to carry. On the expiration of his term, he quitted Rome for the province of Gaul, where he found himself suddenly engaged in wars with the Helvetians and the Suevi. The Optimates recovered in his absence the curule chairs, but their consuls fell under the patronage of Pompeius, who now reigned paramount in the city. Jealous of the renown Cicero had acquired in the affair of Catilina, Pompeius allowed the infamous demagogue Clodius to accuse him, as tribune, before the people, and obtain a sentence of banishment against him for the execution of the conspirators without due form of law. Cicero retired into Macedonia, and thence into Greece, and lowered his character, spotless as it was, by his unmanly lamentations. Pompeius managed also to degrade the rigid Cato by sending him on a harsh and unjust mission to dethrone the King of Cyprus, and annex his dominions to the empire.

SECT. XXX.—PROCEEDINGS OF THE TRIUMVIRATE TILL ITS
DISSOLUTION BY THE DEATH OF CRASSUS.

Political
History.

Cæsar had entered his province in 696, and during the following years was intently occupied in subjugating the tribes of Gaul from the Rhone to the Rhine and the Atlantic. According to the usual policy of Rome and of other conquering races, he effected his purpose by directing the passions of the native tribes against one another, rather than by the strength of Roman arms and the effusion of Roman blood. The Ædui and Arverni in the centre of Gaul, the Remi in the north-east, were disposed, with selfish views of their own, to assist in the ruin of their common country, and the incursions of the Germans from beyond the Rhine furnished the invader with an excuse for proclaiming himself the protector of the Gauls. In 697 Cæsar broke the confederation of the Belgic tribes in the North. The next year he worsted at sea the naval power of the Veneti in Brittany, while his lieutenants subdued Aquitania. In 699 he threw a bridge across the Rhine, and penetrated for an instant into the German forests. In the autumn of the same year he crossed with a powerful armament into Britain, and made a second attack upon the islanders in the succeeding summer. Landing on each occasion on the coast of Kent, probably on the beach at Walmer, he made in his second campaign a rapid march into the interior, forced the passage of the Thames some miles above London, and defeated the King of the Trinobantes, the most powerful of the southern chieftains, before his stockade in Hertfordshire. But his success was not such as to encourage him to leave a garrison in the country, or effect a permanent lodgment there. He was satisfied with the promise of a slender tribute; and this, in all probability, was never paid after the return of the legions. The expedition, indeed, had been undertaken rather for the amusement of the citizens, who listened with interest to their hero's despatches, and for the gratification of the soldiers' cupidity, than with any view of annexing a new province to the empire.

During the progress of his campaigns, whatever their immediate purpose, the vigilance of Cæsar was never entirely diverted from the march of events in the city. Year after year, when the season for military operations was closed, he repaired to the baths of Lucca on the frontier of his province,—for the laws did not suffer an *imperator* to enter Italy while retaining his command,—and there con-
His in-
certed with his friends, who flocked to him in numbers from the city.
Rome, the measures most conducive to the interests of his party and of himself. He had carried his warfare against the nobles to the furthest limits of the law, and had provoked and alarmed them beyond the possibility of forgiveness. In his distant command he was beyond the reach of their enmity: they were well pleased at his absence, and did not grudge him the term of five years which he had in the first instance required. But he knew that whenever he returned as a private citizen to Rome he should fall easily into their power, and he had no trust in the support of either of his confederates. From the moment that the compact had been made between them he had felt the necessity of binding Pompeius to himself by a stronger tie than political interest; for Pompeius could not persuade himself that a party chief as yet so little distinguished could do him more than a momentary service. With a keen discernment of character, Cæsar perceived how this reserved and selfish magnate could be worked on through his sentimental affections. Though advanced in years, and older indeed than Cæsar himself, Pompeius had consented to give his hand to his rival's youthful daughter, and had devoted himself to her as the most uxorious of husbands. He had thus been easily blinded to the schemes of the Gaulish proconsul which kept the Senate in alarm. His attention,

Turbulence of Clodius and Milo.

Recall of Cicero.

M. Licinius Crassus.

indeed, was diverted from them by the turbulence of Clodius and some popular tribunes, whose intrigues for harassing and dividing the nobles were so propitious to Cæsar's views that we must suspect him of covertly instigating them. Pompeius, on his part, was well pleased to see the Senate humbled. When, however, he was himself insulted, and his life threatened, he thought that their degradation had gone far enough, and joined with Crassus to secure the election of vigorous consuls, and tribunes devoted to himself. He countenanced the turbulent agitation with which Milo, a creature of the Senate, rebutted the violence of Clodius, and finally obtained the recall of Cicero from banishment. The people, with their usual fickleness, turned their backs upon Clodius, and received the patriot orator with acclamations. Cæsar congratulated him with a warmth congenial to his generous character, and heaped favours on his brother Quintus, then serving in his army. Pompeius, indeed, looked coldly upon him. The nobles, who had got, as they thought, all the use that was to be made of him, were indifferent to his further career, and he remained for some years in a subordinate position, seeking to keep himself before the public by puerile appeals to his former services, and by hollow flattery of the men really in power. But Pompeius required his own services to be amply requited. On the occurrence of a scarcity in the city, the Senate hastened to confer upon him extraordinary powers for its relief, and Cicero was required to recommend this commission to the people.

Crassus was now impatient of the inferiority of his position. He was not a great military chief like Pompeius; he had conferred no commands, and bestowed no crowns; he was not a popular leader like Cæsar, with a crowd of hungry dependants urging him on for their own advancement; he was not even to be compared as an orator to Cicero, though he had made some useful connections as a pleader and patron; but he was the richest of the Romans, and he represented one marked feature in the character of his countrymen in his sordid pursuit of wealth and love of accumulation. His career had been that of a banker and money-lender in the city; his acquisitions, however great, had been slow and gradual; now, advanced as he was in years, his ambition began to reach further: he coveted the fame of a commander and a conqueror, and lusted for the plunder of a province or a foreign kingdom. After fulfilling his term of office as consul, he demanded of the Senate the government of Syria, and avowed as he set forth from Rome his purpose of making war upon Parthia. The nobles, who were unable to refuse him the proconsulate, professed a pious horror at these unprovoked hostilities, and engaged the tribune Ateius to denounce it as a sacrilege—to meet him as he issued through the gates of the city, and devote him, with awful solemnities, to the vengeance of the offended gods. The minds of the soldiers were painfully affected by this formidable ceremony, and it was with difficulty that Crassus could overcome their terrors, and engage them by redoubled promises to follow him on his ill-omened expedition.

Then did the Senate watch and strain every nerve to baffle the movements of the triumvirs. But the coalition was too powerful for it. While Crassus was gratified with his eastern command, Pompeius claimed and obtained the provinces of Spain and Africa, which he governed by lieutenants, remaining himself in the immediate neighbourhood of Rome; and Cæsar's command in Gaul was prolonged for a second period of five years. The power of the triumvirate was thus apparently confirmed; but the Senate turned with a gleam of satisfaction to the enterprise of Crassus, the disastrous issue of which was already augured from surer tokens than those of the diviners. Crassus was quite incompetent for the task he had undertaken. Having defied the Parthians upon frivolous pretences, he led his army across

the Euphrates, and directed his march across the desert which divides that river from the Tigris. The Parthians retreated before him till they had enticed him to a considerable distance, and finally attacked him with overwhelming force when his men were exhausted with fatigue and heat. A Roman army of three legions was routed and almost destroyed in the terrible battle of Charrhæ, and the disastrous flight which followed. The proconsul was induced to sue for terms of capitulation, and then treacherously slain. A remnant of his army was saved and conducted back to Antioch by Cassius Longinus, the ablest of his lieutenants.

Political History.

Battle of Charrhæ, A.U. 701, B.C. 53. Death of Crassus.

SECT. XXXI.—THE CIVIL WAR TO THE DEATH OF POMPEIUS.

The triple league thus suddenly dissolved had already been shaken by the death of Julia, the daughter of Cæsar, espoused to Pompeius. The nobles saw their opportunity, and excited themselves diligently to improve it. They renewed their overtures to Pompeius, who was becoming jealous of the advance of Cæsar in power and general estimation, and allowed him the unprecedented distinction of holding the consulship for six months without a colleague, —a kind of dictatorship without the name, for which the disturbances in the city seemed to afford an excuse. The Gauls, once apparently conquered, had risen again in a wide-spread revolt, and the position of the conqueror had become imminently precarious. Pompeius, who had suffered from a dangerous sickness, was elated by the extravagant acclamations of the citizens on his recovery, and the Senate easily persuaded him that he could stand alone at the head of the government, and even if Cæsar escaped the perils in which he was involved, securely spurn his alliance and defy his enmity. But all these calculations were doomed to disappointment. The abilities and fortune of Cæsar triumphed over the Gauls, and he was enabled to complete his conquests, and recruit his exhausted legions from the flower of the Gaulish youth. Before the expiration of his second term of office, he had finished the task he had undertaken to accomplish, and found himself in a position to demand the consulship a second time. The Senate, alarmed at the prospect of his return, required him to relinquish his command before venturing to sue for a civil office; but he was well aware that, once divested of military support, he would lie at the mercy of unscrupulous enemies; and he retorted with the demand, which he knew would not be complied with, that Pompeius, who at the moment held the command of the armies in Spain, while continuing to reside within sight of the city, should at the same time surrender his extraordinary appointments. Both parties could appeal to the letter of the law; but on both sides the appeal to law was a mere pretence. Party animosities and private ambitions had come to such a head that Cæsar could not be safe without the guarantee of a high official position; the Senate could not be safe without degrading and trampling him under its feet. A contest had become inevitable, and it was little matter from which side the first blow actually came.

Still, with a people devoted like the Romans to the observance of constitutional fictions, it was an object of some importance to preserve a mere show of legality; and this advantage, such as it was, was secured to Cæsar when two of the tribunes, who had protested against the fierce demands of the Senate, fled from Rome by night, affecting alarm for their own safety, and sought refuge in the camp of the proconsul, which he had advanced to the frontier of his province. The news of their flight outstripped their own arrival; and Cæsar, with his usual lightning-speed, crossed the Rubicon with a few battalions, and met them at Arimiorum, proclaiming that he entered Italy in arms to vindicate the majesty of the law. Thus outraged in their persons, Pompeius and the Senate were dismayed at the

Dissensions between Cæsar and Pompeius.

Cæsar crosses the Rubicon, A.U. 705, B.C. 49.

Political
History.

had fed on the lessons of a self-devoting philosophy; and when the conspirators against Cæsar's life looked for a name under which to range themselves, they found none so suitable as his for their purpose. Brutus was won over to join them, with Cassius and others, who for the most part were galled by personal slights, or inflamed by petty jealousies. Brutus indeed, such was the judgment of the Romans themselves, was the only one amongst them whose aims were really pure and patriotic. Though Cæsar had renounced many of his highest qualities, his courage had not deserted him. No tyrant was ever so fearless, so confident in his fortune, and in the greatness of his own destiny. His legions had quitted Italy; he had refused the bodyguard offered him by the Senate. He traversed the streets of Rome in the midst of all the factions he had outraged with no other attendants than his troop of private fiends and clients. His person was assailable at any moment; and the conspirators selected the Senate-house itself as the spot in which to attack him. On the Ides of March, the 15th of the month, they fell upon him with poniards borne beneath their robes; and he fell, pierced with thirty wounds, at the foot of the statue of Pompeius.

Death of
Cæsar,
A.U. 710,
B.C. 44.

Cicero, who had accepted the supremacy of the popular leader even before the battle of Pharsalia, and had submitted, with the sorrow of a philosopher and a patriot, to a revolution which he had himself long felt to be inevitable, was no party to this act of personal animosity. But when the deed was done, and the assassins proclaimed themselves the deliverers of their country, he too indulged in the dream of reviving liberty, and cited many an ancient precedent to justify the crime. Cicero now united himself to the band of self-styled patriots in the Capitol, whither they had repaired for fear of the populace, and assisted them with his advice. It had been well, indeed, for the cause of the oligarchy, if the men who now assumed to be its champions had listened to his counsels. But they suffered themselves to be cajoled by Antonius; and that skilful partizan, having obtained permission to celebrate Cæsar's obsequies in public, contrived to play on the feelings of the multitude, and raise a storm of grief and indignation which completely paralysed them. The people insisted on burning the body in the Forum, and erected a chapel on the spot, which was afterwards converted into a temple. The murdered Cæsar was advanced to the honours of divinity, which had not been offered to Marius, or Scipio, or Camillus, before him. His soul, it was declared, was borne to heaven in the comet which appeared conspicuously about the period of his decease. Not the citizens only, but foreigners of every nation residing in Rome, and particularly the Jews, united in these demonstrations of sorrow, and showed that the death of Cæsar was regarded as a general calamity to mankind.

vinity.

SECT. XXXIV.—THE SECOND TRIUMVIRATE, AND FINAL OVERTHROW OF THE REPUBLIC.

Intrigues
of M. An-
tonius and
the young
Octavius.

Antonius and the liberators had combined together in proclaiming a general amnesty; but such was now the state of irritation in the city, that the actors in the recent tragedy for the most part withdrew from public sight. During the dictator's lifetime the friends of freedom had comforted themselves, in the eclipse under which it had fallen, with the remembrance of his advanced years, of the perils in which he was continually thrusting himself, and of his having no direct descendant. He had left, however, a nephew, the son of an Octavius, whom he had adopted as his son, and who now bore the name of C. Julius Cæsar Octavianus. This youth was at this time only nineteen, and at the moment of his uncle's death he was absent with a military tutor in Illyricum. Few supposed he would have the courage to proclaim himself the heir of the murdered usurper, to claim his private property, while Antonius had got into his own

hands, still less to assert his legitimate title to the championship of the popular party, and to the first place in the commonwealth. But the ambition of the young Octavius (such is the name by which he is most commonly designated) was equalled by his confidence, and these again by his cunning and ability. Throwing himself boldly into the midst of the citizens, he cajoled Cicero with the warmest professions of patriotism, while he demanded the restitution of his private inheritance from Antonius. The field gradually cleared around him. Brutus and Cassius, finding themselves unpopular and even insecure in the city, retired first into Campania, and then to their provinces Macedonia and Syria. Antonius put himself at the head of some legions, prepared to fight for pay and plunder under any commander, and took up a threatening position in the Cisalpine. The Senate, inspired with energy by the eloquence of Cicero, who thundered forth the series of orations against the traitor to which he gave the name of *Philippics*, armed the consuls Hirtius and Pausa, and sent them to confront him; while Octavius led an army of his own, the most devoted of his uncle's battalions, ostensibly to support the government, but really to watch the event, and attach himself to the party which should prove the stronger. A third division of the Cæsarean force had also assumed an attitude of observation under Lepidus in Gaul. In the spring of 711 Antonius came to an engagement with the consuls near Mutina, in which, though he was himself defeated, both Hirtius and Pausa were slain. This event proved a death-blow to the Senate. Octavius, instead of pursuing the routed Antonius, as he was expected to do, chose rather to unite himself to him, and concert a coalition with Lepidus and Antonius for the joint usurpation of the empire. This combination, known by the name of the Second Triumvirate, was effected in an island of the River Rhenus, near Bologna. The contracting parties agreed between themselves to exercise consular power in common for five years, to dispose of all the offices of state, and to enforce their decrees as the law of the republic. They assigned the two Gauls to Antonius, Spain and the Narbonensis to Lepidus, Africa and the islands to Octavius. Italy was to remain neutral ground; the provinces of the East were to be left for future division, when Brutus and Cassius should have been overthrown by their united forces. This compact was followed by the proscription of their enemies in Rome, each triumvir claiming to insert the names of those most odious to himself, and each sacrificing in return friends and kinsmen of his own. Antonius demanded the head of Cicero, which Octavius ungratefully surrendered to him. Their edicts were immediately put in execution. Some hundreds of the senators and 2000 knights were destroyed by hired assassins: Cicero, though long warned of his danger, neglected to make his escape till too late, and was overtaken and slain at his country villa.

Death of

An interval of eighteen months had elapsed since the retreat of Brutus and Cassius into the East before the triumvirs were at leisure to engage in a campaign against them. During this period the republican chiefs had foreseen the struggle that was impending, and they had not been remiss in assembling troops, and collecting money and munitions. But their armies were for the most part composed of raw levies; and in the indifference manifested by the populations of Greece and Asia to the watchwords of party in the West, they had been obliged to extort treasure by force, sometimes to inflict cruel chastisement on the reluctant provincials. Brutus himself had sullied his great name by these terrible exactions. As the crisis of the struggle drew near, and Octavius, with Antonius at his side, led their formidable forces into Macedonia, his fortitude seems to have forsaken him; the peaceful philosopher was haunted with a vision of Cæsar's ghost, and he was impatient for the day which should end, either by death or triumph, the pertur-

Political History.

Death of Brutus and Cassius.

bation of his afflicted mind. When the opposing armies met at last on the plains of Philippi, Cassius, a more experienced officer, would have postponed the combat, but Brutus insisted on precipitating the crowning struggle. Brutus was confronted with Octavius, Cassius with Antonius. Brutus had gained the advantage on his side of the field; but Cassius, dismayed at his own partial failure, threw himself on his sword. The survivor now found himself obliged to withdraw. Nevertheless, circumstances were still in his favour; the enemy was straitened for supplies, and delay might even yet have secured him a bloodless triumph. But again his impatience was not to be controlled; and in a second combat, twenty days later, on the same ground, he suffered a defeat, which, by killing himself, he rendered irretrievable. His party, deprived of both its leaders, was now utterly broken. Several of the officers, chiefs of the nobility, put an end to their own lives; but the conquerors showed more clemency in the hour of victory than at the outset of their enterprise, and allowed their enemies for the most part to save themselves by submission. Some of them escaped by sea, and attached themselves to the fortunes of Sextus Pompeius; but the republican party never rallied again in the cause of liberty, and the battle of Philippi closes the annals of the Roman free state.

SECT. XXXV.—CONTEST BETWEEN OCTAVIUS AND ANTONIUS.

Antonius fascinated by Cleopatra.

The battle of Philippi had been won by the efforts of two only of the triumvirs, and the third found himself from this time wholly set at naught by his more vigorous colleagues, the masters of the united forces of the empire. But the union of these mighty potentates was of short duration. Antonius assumed the command of all the regions of the East; and while he amassed plunder for himself, or squandered it upon his followers and parasites, he fell into the toils of Cleopatra, the fascinating queen of Egypt, who sailed from Alexandria to Tarsus to captivate him. Returning with her to the banks of the Nile, he abandoned himself without remorse to voluptuous pleasures, which degraded him in the eyes of the Romans, while his late colleague, now his rival, Octavius, was governing Rome and Italy with a prudence and self-control which won the applause of the citizens. Here the wife and brother of Antonius intrigued against him, and raised the standard of faction. The brother was overcome at Perugia; and, though spared himself by the policy of the conqueror, three hundred of his most distinguished adherents were sacrificed, according to the popular story, to the shade of the murdered dictator. The wife retired to join her husband in the East, but was ill received by him, and died, perhaps of mortification, soon after. A new alliance was now formed between the rival leaders, who could not divide the empire between them, or contend for its sole possession, till they had united to put down Sextus Pompeius. The treaty of Brundisium, effected by the agency of Cocceius, Pollio, and Mæcenæ, provided for a combined effort against this annoying adversary, and was cemented by the marriage of Antonius with Octavia, the sister of his ally.

War of Perugia.

Compact with Sextus Pompeius.

Sextus, at the head of a piratical flotilla, occupied the seas between Italy and Africa, and held some maritime stations in Sicily. In this situation he was able to cut off the corn ships which supplied Rome, and the city was reduced from time to time to the direst necessity. The rule of Octavius at Rome was shaken at every access of scarcity and impending famine; and the suppression of this cause of annoyance was of more vital importance to him than to Antonius. Octavius therefore undertook the conduct of the war; but he prudently invited the enemy to come to terms, and they arranged a treaty at Misenum, by which he was admitted to a definite share in the empire. To him were assigned the three great islands of the Tyrrhene Sea;

VOL. XIX.

Political History.

and the families of Pompeius and Octavius were further united by a marriage (A.U. 715, B.C. 39). Octavius was now at liberty to turn his arms against some revolted tribes in Gaul, while Antonius undertook to lead an expedition into Parthia, and avenge the disaster of Crassus. The first soon executed his purpose with his usual promptitude; the other lingered indolently in Greece. Sextus meanwhile failed to surrender some places he had previously occupied on the coast of Italy, and again intercepted the supplies of the city. Octavius had no alternative but to make war upon him. He summoned his colleagues to his aid. Lepidus promised, but delayed; Antonius sent him ships, but demanded soldiers for his Parthian expedition in return. Octavius, however, was better served by the skill and spirit of his friend Agrippa, who gained him victories at sea, and repaired the disasters which he experienced in his own person. The struggle ended in the complete overthrow of Sextus the armaments of Sextus, from which the chief himself escaped only to perish miserably a few months afterwards. At the last moment Lepidus rashly committed himself to an act of hostility against the victorious triumvir. He was instantly worsted; and though his life was contemptuously spared, his armies and his provinces passed finally into the hands of Octavius.

Sextus overcome by Octavius.

Fall of Lepidus, A.U. 718, B.C. 36.

The contest for empire was now reduced to a struggle between two competitors, and it was not long before it came to the arbitrament of the sword. While Octavius was winning golden opinions in Rome and Italy by the plausible moderation of his manners, and by the ability of his government, in which he was seconded by Agrippa and Mæcenæ, his rival was falling more and more into contempt.

Antonius undertook indeed an expedition against the Parthians; but the issue was disastrous; and the mortification of the citizens was redoubled when their worsted champion quitted his flying troops to fling himself into the pleasures of his Egyptian capital, and celebrated, with Cleopatra at his side, the mockery of a Roman triumph in a foreign dependency. He had already renounced the amity of Octavius by repudiating the sister, whom he had taken to wife. He now devoted himself wholly to Cleopatra, and passed his days and nights in sensual revelry. These eccentricities, reported, perhaps with some exaggeration, at Rome, caused the deepest feelings of disgust; and disgust was succeeded by alarm when he was said to be preparing an attack on the Empire of the West, and Cleopatra was declared to have boasted of the laws she would issue from the Capitol. By this time Octavius had recruited his legions, and amassed treasure. When he found the minds of the citizens fully enlisted in his support, he came forward as the protector of the state,—the champion of the Senate, the people, and the gods of Rome,—and led all his forces in person across the Adriatic. Antonius, on his part, had not been slack in preparations. He too advanced, with Cleopatra in his train, and brought all the resources of the Actium, wealthy realm of Egypt to support the presidiary cohorts of Greece and Asia. Armies, numbering more than 100,000 men on either side, confronted each other on the coast of Acarnania, near the entrance of the Ambracian Gulf; but the fortune of war was first tried by the rival fleets off the promontory of Actium. The vessels of Antonius were bulkier and more numerous; but the light barks of Octavius, under the command of the experienced Agrippa, were more skilfully handled, and fought more gallantly. The issue of the combat, however, was still doubtful, when Cleopatra, through fear or treachery, gave her own squadron the signal of retreat, and carried off with her sixty galleys of Egypt. Antonius madly rushed away to follow her, leaving his ships and armies to their fate. His ships, indeed, still continued the combat under every disadvantage, and were finally overpowered, and for the most part destroyed. His legions, however, finding themselves thus miserably de-

Battle of Actium, A.U. 727, B.C. 31.

Political
History.

serted, refused to fight for their betrayer, and surrendered without a blow. The battle of Actium, fought on the 2d Sept. A.U. 723 (B.C. 21), threw the whole military force of the empire into the hands of Octavius, and assured him of a complete and speedy triumph over the remnant of his rival's resources.

Antony and Cleopatra reached Alexandria; but the Roman was indignant at the conduct of his mistress, to whose base desertion he ascribed his overthrow, and at first refused to see her. Blinded, however, by his passion, he yielded again to her blandishments, and she amused him with schemes, sometimes for defence against the expected enemy, at other times for flying beyond the southern sea, and reigning in remote security over some Arabian province. She hoped probably to make her own peace with Octavius by the sacrifice of her infatuated admirer. The conqueror at last appeared on the frontier. Antony went forth gallantly to meet him, and gained some partial success. But Cleopatra meanwhile had betrayed her fleet to the invader, and the gates of Alexandria were opened to him without resistance. Antony, in his frenzy, threatened to destroy his ensnarer, and she took refuge in a tower, and sent him word that she had killed herself. The passion of the insensate Roman revived; he stabbed himself, and while slowly dying, caused himself to be removed beneath the windows of her place of retreat, and entreated her attendants to place him beside her body. Cleopatra caused him to be lifted into her chamber, and he expired immediately in her arms. She now exerted all her artifice to obtain terms from the conqueror. She had vanquished both Cæsar and Antony by her charms, and she still hoped to prevail over the youthful Octavius. Admitted to an interview, he resolutely kept his eyes averted, and she despaired of moving his sensibility. She could consent to surrender her kingdom, but she spurned with indignation his cruel demand to exhibit her to the Roman citizens in his triumph. When he still insisted, though with the fairest words and promises, she had no choice but death, and as he set a guard over her to prevent her using the sword, she contrived to get an asp conveyed to her in a basket of figs, applied it to her arm, and perished.

Death of
Antony.

Death of
Cleopatra.

The expected triumph of Octavius was deprived of its most coveted ornament; but Egypt was straightway annexed as a province to the empire, Cæsarion, a son of the dictator by Cleopatra, put to death, the sons of Antony by the deserted Octavia carried to Rome to be bred as scions of the conqueror's own family. Octavius made a progress through the eastern provinces on his return, receiving the homage of dependent potentates, putting down the partizans of his adversary, and setting up his own in their place, securing the fidelity of the Roman garrisons under officers of his own choice. When he arrived at his capital in the year 725 he had consolidated the whole empire under the government of his single arm, and the republic of Rome was finally exchanged for a monarchy.

A.U. 725,
B.C. 29.

SECT. XXXVI.—CONSTITUTION OF THE EMPIRE BY AUGUSTUS.

Augustus
pretends to
govern by
constitu-
tional pre-
cedents.

About this great political fact there could be no doubt then or since; but the genius and the merit of Octavius consisted in the specious disguise which he succeeded in throwing over it. At the moment of his return to Rome the ancient constitution was still existing in all its forms; the Senate still possessed the ample prerogatives assigned to it of old, and the people were still the legitimate depositaries of power in the last resort. Octavius affected still to recognise the paramount authority of the public will. He professed to have wielded hitherto only delegated functions, and in these he pretended to have followed the spirit of established precedents. In all extraordinary emergencies the Romans had had resort to extraordinary commissions.

Such were the dictatorships of the early republic, the repeated consulships of Marius, the permanent dictatorship of Sulla, the vast military charges and the sole consulship of Pompeius. The "triumvirate for the arrangement of public affairs" was itself the application of an ordinary title to one of these extraordinary commissions. But this commission, constitutional or not, Octavius had scrupulously resigned at the expiration of the term to which he had restricted it; it was as consul and the elected of the popular assembly that he had conquered at Actium and subjugated Egypt. The regulation he had made of the affairs of the empire in the East, after the manner of Pompeius and Sulla, still awaited the formal sanction of the Senate; and the Senate was supposed to retain authority for granting or withholding from him the triumph he had so gloriously earned.

Political
History.

The "acts" were duly ratified, and the triumph was accorded. When the ceremony, together with the shows and festivals and glowing acclamations which accompanied it, had reached its termination, the imperator still stood at the head of the legions which had followed his triumphal car. According to the laws of the free state, Octavius must now disband his army or resign it to the disposal of the Senate; for with the triumph his *imperium* was become extinct. But he evaded this necessity. He allowed the Senate, prone as it was to flatter and caress him, to give him the title of Imperator in the same sense in which it had been conferred upon Julius Cæsar, thereby proclaiming him commander-in-chief of the national forces, placing every legion under his auspices, and every officer under his orders. As imperator, he retained the right of bearing, even in the city, the sword and cloak, the ensigns of military power; but this prerogative he cautiously refrained from using. The fate of Cæsar had warned him to accept less than was offered him. Content with the substance of power, he declined all invidious shows and titles. Though the people, in their enthusiasm for him, would have acceded to any usurpation on his part, he knew that neither king nor dictator would have been safe from the daggers of the senators. It was to exalt the estimation and give a fair shadow of authority to the Senate that his next efforts were directed. Having obtained the powers of the censorship, he proceeded to revise the list of senators, to eject the unworthy, to endow the impoverished, and create a body distinguished for its family and personal influence. Cæsar had degraded the order in its own eyes by intruding into it foreigners and base-born citizens. The triumvirs had been tempted to carry this practice still further. Octavius now retraced his steps. He reduced the number from 1000, to which Antony had swelled it, to its proper limits of 600, and required a considerable property qualification. To the Senate, thus re-modelled, he left its ancient distinctions, and the greater part of its ancient prerogatives, directing its decisions in political and legislative affairs by management rather than by strict control; but he settled the course of his administration with the help of a private council of fifteen assessors, and decided the vexed question of the *judicia* by appointing a court of salaried judges, one hundred in number. To the people he left the old forms of popular assembly and the election of magistrates; but here again he interfered so far as to nominate the candidates to be submitted to their choice. The names and generally the functions of these magistrates remained as of yore. But in order to secure an easy means of guiding the Senate, Octavius revived in his own behalf the title of "Princeps," which gave him the first place and the first voice in the curia. This purely civil dignity, ennobled by some illustrious occupants under the commonwealth, had been always held for life, and accordingly Octavius could venture to accept it in perpetuity, while he demanded the powers of the censorship for five years only, and offered, with much appearance of earnest-

Functions
of the Im-
perator and
Principes.

Political History. ness, to resign the imperium after ten. He allowed, however, both these powers to be renewed to him for successive terms to the end of his career.

The Potestas consularis and Tribunitia. The consulship Octavius continued to exercise for several years successively; but he ultimately renounced the title, though he retained its powers by an extraordinary prerogative. Invested with the *potestas consularis*, he occupied the highest place in the city, and was recognised as the chief of the state, the head of the legislative and executive, the organ of its foreign policy. When the consul quitted his post in the city, he carried to the frontiers of the empire the same supreme authority which he had before wielded at Rome. When he vacated the office, and assumed the government of a province, he commanded the soldiers and citizens as imperator, and reigned as proconsul over the subjects of the state. But Octavius allowed himself to claim proconsular power together with the consular. As imperator, he had divided with the Senate the direct administration of the provinces, choosing for his own all those in which large armies were maintained for aggression or defence, and leaving to chiefs appointed by the Senate a civil supremacy in the unarmed and tranquil; but his proconsular authority was extended alike over all, and he asserted paramount powers, when occasion required it, in every quarter of the empire. The circle of the imperial prerogatives was completed by the powers of the tribuneship. This *potestas* was also declared perpetual, though renewed nominally from year to year. The authority this power gave the emperor in the Senate was a safeguard against any possible insubordination in that assembly; but its chief value lay perhaps in the continued popularity of its name. The populace of the city still regarded the tribuneship as the legitimate guardian of its rights and interests, and hailed Octavius as its proper champion, its protector against the sinister intrigues of the Senate. It gave a sanctity to his character, and rendered his person inviolable. When to this was added, at a later period of his career, the dignity of sovereign Pontiff, he acquired the control of the instrument of the state religion; and the defence of the citizens against the machinations of the nobles was supposed to be complete.

The chief priesthood. The assumption of all these offices and functions was not effected at once: Octavius ascended to the summit of his ambition cautiously, and step by step. Meanwhile he discreetly waived every designation which should imply in itself the sovereignty he affected to disguise. Antonius had abolished the dictatorship to gratify the people, and Octavius took care not to revive it. No voice was suffered to hail him with the title of king. Nevertheless he was ambitious of a distinctive appellation; but it must be personal, not official. He would not be called "Quirinus,"—such a title would be extravagant; nor "Romulus,"—the name was of evil omen. To the epithet of "Augustus," which was next suggested, no objection could attach. It implied the nobleness of his character and functions; it had an air of sanctity, and even divinity; it bore an auspicious reference to the anticipated increase of his honours through time and eternity. The worship of Octavius as a god was rapidly spreading in the provinces; in the city, it was only permitted to pour libations to his genius—a distinction hardly palpable in the purest ages of religious usage and belief, and which court poets and flatterers could now easily obliterate.

The title of Augustus. Acquiescence of the Romans in the disguised monarchy of Augustus.

SECT. XXXVII.—THE POLICY OF AUGUSTUS IN ITS MORAL AND SOCIAL ASPECT.

Octavius, or, as he may now be styled, Augustus, retained the sovereign power to the end of his career, a period of more than forty years. During all that time his life and fortunes were assailed twice or thrice, but only by privy conspiracy among the nobles, never by any movement

of the people. From first to last no audible murmur was raised against his ascendancy. This must be accepted as a proof how welcome were the safety and tranquillity he offered to the Romans, after a century of intestine divisions and sanguinary struggles; but it proves beyond this, that, in the deliberate judgment of the nation, a limited or veiled autocracy was the form of government which, in the advance or decline of civilization, whichever we may deem it, had become most advantageous for them. Doubtless their first impulse was to hail the victor of Actium as the restorer of peace, and the saviour of the state from foreign aggression and domestic dissensions. The remains we possess of the literature of the period breathe this spirit of intense satisfaction, as at the revival of a golden age. The mission of the Romans is now declared to be, not to conquer all nations, to trample upon all national usages, or to luxuriate in the enjoyment of the world's wealth, but to bind all peoples together in one common union; to bend the necks of rebellious potentates to the yoke of international law; to quell all unruly ambitions, and inaugurate a reign of universal contentment and moderation. Once before, and once only, the ancient world had been brought under the sway of a single sceptre, and enthusiasts might have indulged under the Macedonian Alexander in such dreams of human happiness; but the fair vision had been quickly overclouded when his premature death left his empire to be torn in pieces by rival generals. The great bulk of the Roman people had no other anxiety about the empire of Augustus but the fear lest at his decease—and his constitution was weakly and his health precarious—the solid fabric of material prosperity he had raised should crumble under the violence of mere selfish usurpers. The idea of hereditary succession in political office had hitherto met with no favour in the republic; but the circumstances of the time now strongly recommended it; and without any formal concession of the principle, the minds of the Romans became implicitly reconciled to the anticipation of a dynasty of Cæsars.

But this favourable disposition on the part of the people would have been of no avail to maintain and perpetuate the empire had not Augustus been himself singularly endowed with the temper and talents required for advantageously using it. Heartless and cruel as he had proved himself in the pursuit of his ambitious projects, he henceforth prescribed to himself a career of clemency and considerate indulgence. He opened the field of public honours to men of all parties, and caressed with marked favour the kinsmen of his own most noted opponents. Even on those who actually conspired against him, he could not always be brought to inflict punishment. He gloried in constraining his public enemies to become his private friends. There may have been little genuine feeling in this course of policy,—the Romans themselves may not have been wholly deceived by this pretended generosity; but while they enjoyed the benefit of it, they did not criticise it too closely: Augustus succeeded in his object of securing their confidence and affection. He was not satisfied, however, with enlisting their personal feelings in behalf of his government. His ambition was not wholly selfish; he undoubtedly looked beyond his own greatness, his own security, or even the establishment of his family in greatness and security after him. He looked even beyond the establishment of his own future fame. He had a true and earnest desire to revive the fortunes of the Roman state, and launch it again, after the terrible crisis of the civil wars, on a fresh career of prosperity and glory. Unfortunately his views were warped by the common spirit of antiquity, the spirit of heathenism, which, devoid of a faith in Providence and hope for the future, always placed its ideal of excellence in some dreamy misconception of the past. Augustus sought to re-animate the life of Rome by restoring

Political History.

His moderation and discretion.

Political
History.

His at-
tempt to
revive the
spirit of
antiquity.

the ideas and principles of a shadowy antiquity. These ideas, indeed, in so far as they had really guided the actions of the Scipios and the Camilli, had sprung from the laws and usages of their times: it followed then, so he fondly reasoned, that by restoring the usages the ideas themselves would be revived. By a strict execution of the functions of the censorship, by sumptuary laws, by police regulations, by reviving the honour of matrimony and the priesthood, by restoring the temples of the gods and the temple services.—by these and such-like measures he hoped to create again the people who had rejected the bribes of Pyrrhus, and retorted the invasion of Hannibal by an attack on Carthage. These efforts were no doubt wholly unavailing: the Roman people had lost its belief in religion, and therewith the only potent principle of self-control; the springs of public and private life had been poisoned by selfish and criminal indulgence; and by drawing closer the bands of law, Augustus only produced some outward decency at the expense of honesty and self-respect. The corruption of the times is more painfully marked in the affected decorum of Horace than in the glaring coarseness of Catullus, in the easy indifference of Ovid than in the open infidelity of Lucretius. In his vigilant control of the public administration, the imperial reformer was more successful. The ordinary procedure of justice was conducted with a firmness and equity unknown probably in the best times of the republic. A strong check was imposed on the violence and rapacity of the officials in the provinces. The Romans and their subjects were taught to regard each other with mutual respect. On the whole, whatever its drawbacks and defects, the policy of Augustus must be pronounced eminently successful in promoting the happiness and prosperity of the Roman world. Few or none of the citizens could look beneath the fair surface then presented to them, and anticipate the decay of public feeling, the decline of high principles, the growing acquiescence in merely sensual enjoyments, which would surely ensue from the stagnation of public life, and the concentration in a single hand of all the powers of the government. The Romans had had no example, on a similar scale and under similar conditions, of the transition from freedom to subjection. The autocracy of Augustus was an experiment in politics, from which they hoped the best, of which possibly they augured the best, but of which, whatever they might hope or augur, they felt in their inmost hearts the absolute and over-ruling necessity.

SECT. XXXVIII.—INTERNAL GOVERNMENT OF THE EMPIRE.

Pacific
policy of
Augustus.

On the restoration of universal peace, Augustus closed the temple of Janus, an act of grace which the citizens, who could record but two previous instances of it, celebrated with the loudest acclamations. His own military ardour was satisfied by the victories he had won over domestic enemies by the hands of Agrippa; he had no ambition for the fame of a conqueror; and henceforth he only led his legions to repress the brigandage of the Iberian mountaineers, or sent a grandson to demand from the Parthians the long-abandoned standards of Crassus. He allowed some minor expeditions to be undertaken against the predatory hordes which infested the frontiers of Egypt or Mauretania; and he sanctioned one wild and profitless expedition against the nomade tribes of Arabia. The border warfare on the Rhine, of which more special notice must be taken presently, was another exception to this pacific policy; but generally the arms of Rome, under Augustus were confined to securing the peace of the empire, and sedulously withheld from aggression in every quarter. A long period of repose was required to consolidate the heterogeneous elements which composed this vast dominion. Italy, the centre of the empire, and now made to comprise

the whole peninsula from the Alps to the Straits of Messina, was divided into eleven regions, and placed under the direct control of the prætor in the city. The rest of the empire was apportioned, as we have said, between the emperor and the Senate. The imperial provinces were the Tarraconensis and Lusitania in Spain; the whole of Gaul beyond the Alps, divided into several commands, including the Upper and Lower Germanies, as they were called, on the Rhine; Pannonia and Macedonia; Coele Syria, Phœnicia, Cilicia, Cyprus, and Egypt. To the latter were assigned Bœotia, Numidia, Africa, the Cyrenaica, Achaia, and Asia. Dalmatia, including Illyricum, at first given to the Senate, was soon afterwards taken by the emperor in exchange for the Narbonensis and Cyprus. Before the end of his career, Augustus annexed Palestine also to the empire, which then extended over every coast and island of the Mediterranean. In some quarters, as in Gaul and Pannonia, the sway of Rome penetrated some hundreds of miles into the interior of the continent; but the regions remote from the great inland sea, the highway of international traffic, were almost wholly barbarous. Gaul and Thrace were little better than vast forests; only a small portion of their soil was as yet subjected to cultivation. The great cities of the empire, the marts of human industry and emporia of commerce, were for the most part seated on the shore, or on the banks of navigable rivers. When the Romans boasted of having subdued the world, they really confined their view to the Mediterranean and the countries immediately bordering upon it.

Political
History.

Division of
the pro-
vinces, im-
perial and
senatorial.

The entire possession of this midland basin gave easy access to every province of the empire; and the facility thus presented for communication between them, when the police of the seas was vigilantly maintained, developed the capabilities of every country simultaneously, and bound them all together by the chain of a common interest. No empire was ever more favourably circumstanced than the Roman for the advancement of its national prosperity, and for the interchange of thought through all its members. So completely was peace the common interest of the inhabitants of all its inland shores, that the Mediterranean provinces were left almost wholly without military garrisons: every state and town could be trusted to maintain its own police, and keep watch over the behaviour of all the others. Italy, and Rome itself, were left without any regular defenders: the emperor entrusted his own personal safety to a few scattered cohorts of prætorians or bodyguards; it was not till the reign of his next successor that these battalions were even collected together in a camp at the gates of the city. Their numbers at no time exceeded 10,000 or 20,000. The legions which constituted the standing army of the empire were relegated to the frontiers, or to distant and turbulent provinces. Three of these divisions, each a little army in itself, were stationed in the Spanish peninsula. The banks of the Rhine were guarded by no less than eight: two were placed in Africa, two in Egypt, four occupied the eastern frontier, four more were posted on the Danube, and, finally, two were held in reserve in Dalmatia, within easy reach of Rome itself, if their presence should at any time be demanded there. The full complement of each of these 25 legions was 6100 foot and 726 horse; and this continued, with occasional variations, to be their strength for a period of 300 years. The cohorts of which they consisted were 10 in number, besides the squadrons or turms of horse. They were recruited generally from the mountains beyond Italy, at first from the genuine citizens of Rome in the provinces, but this restriction was not long maintained. The inhabitants of Italy itself began now to claim exemption from legionary service altogether, and were enlisted only in the prætorian bands. Numerous battalions of auxiliaries, with array and arms differing from those of the legionaries themselves, were

the remnant of its soldiers and civilians driven in confusion behind the Rhine. In the face of such a disaster Augustus, now old and timid, gave way to nervous alarms. He trembled for the tranquillity of the city, for the loyalty of the citizens, much more than for the defence of the provinces. With the assistance, however, of Tiberius, he acted with sufficient vigour in recruiting his forces and restoring confidence. The younger Cæsar took the field, and made a show at least of offensive operations against the victorious Germans. He did not venture, however, to occupy again the footing lately held beyond the Rhine. Augustus, who died soon afterwards, in the year 767, left it in charge to his successor not to extend in any direction the limits of the empire.

Death of
Augustus,
A.U. 767,
A.D. 14.

SECT. XL.—REIGN OF TIBERIUS (A.D. 14–37).

Character
of Ti-
berius.

Tiberius, now in his fifty-sixth year, had discharged the most important offices in the Senate and the field, and was regarded as an able and accomplished prince. But the state of constraint under which he had lived as the presumptive successor of the empire, under a jealous and exacting stepfather, together with some sacrifice of the affections which had been extorted from him in his youth, had soured a temper naturally reserved and proud. For a time he had withdrawn altogether from public affairs, and during his retreat at Rhodes rumour had been busy in representing him as indulging in the grossest vice and cruelties. But his mother Livia, an able intriguer, watched over his interests. On the death of Augustus, the Senate learnt that he had been appointed the head of the Cæsarean family, and they readily, and indeed with much eager flattery, thrust upon him all the public honours and functions which Augustus had vacated. For some time he enacted the farce of pretending to refuse them; but this affectation was speedily overcome, and he retained a deep grudge against those among the senators who had been blunt enough to take him at his word. His first act, an omen of a bloody reign, was the assassination of a surviving son of Julia and Agrippa, called Posthumus, as having been born after his father's death; a youth of acknowledged evil temper and defective understanding, whom Augustus had himself removed from public affairs and relegated to an island. The jealousy of Tiberius soon extended to his nephew Germanicus, son of his elder brother Drusus, whom Augustus had required him to adopt and place on the same line of succession with a son of his own. Germanicus was a great favourite with the people. He seems to have been a man of military genius, which he exercised with considerable success against the Germans beyond the Rhine, though a naval expedition under his orders suffered a terrible disaster from tempest. He had formed a plan for the complete reduction of the country as far as the Elbe, and the spirit of the barbarians had been so far broken, in spite of the gallantry of their hero Arminius that in another campaign he might possibly have succeeded; but Tiberius was jealous of his fame and popularity, and forbade any more blood and treasure to be lavished on conquests beyond the bounds of the empire, as he had received it from Augustus. Germanicus was recalled to Rome, and allowed the empty honour of a triumph. The emperor was glad to rid himself of his presence on the first opportunity, and soon after dispatched him into the East, to overawe the Parthians. Not content with removing him from Rome, he deputed—such at least was the common belief—an officer named Piso to watch his conduct, and connived at this man's thwarting and disobeying his legitimate commander. Germanicus ordered Piso to surrender his office in Syria, but at the same time he found himself attacked by a debility, which, after a short interval, terminated in his death. His family accused Piso of foul play either by poison or at least by magical

cus.

Death of
Germani-
cus.

Political
History.

incantations. Agrippina, the spirited consort of the deceased prince, prosecuted a charge of murder against him at Rome. Confident in the emperor's favour, Piso did not shrink from meeting it; but when he found that the emperor looked coldly upon him, and was disposed to abandon him to his fate, he anticipated the decision of the judges by a voluntary death. But the suspicions of the people were not thus averted from Tiberius. The deep sorrow they evinced at the loss of their favourite gave great umbrage to the tyrant, and induced him to treat with jealousy and harshness the widow and her children.

From the first, Tiberius had dissembled with the Senate, and he naturally distrusted them; while towards the other classes of his subjects, and particularly in the provinces, his conduct, though stern, was equitable; he took every opportunity to trample on the pride of the senators, to lower their estimation, and to make them feel his superior power. It was a great relief to them when, towards the middle of his reign, after devoting himself to the business of state with unwearied assiduity for many years, and never quitting Rome even for ordinary relaxation, he began gradually to withdraw more and more to the solitude of the isle of Capræ, an imperial domain purchased by Augustus, in which he took great delight. Though the popular notion, repeated by the historians, that he here abstained altogether from public affairs, and suffered the conduct of the administration to slip from his hands, seems to be grossly exaggerated, it was impossible but that an inordinate share of influence and power should accrue to the confidential minister whom he must leave in his place at Rome. Sejanus, the notorious favourite of Tiberius, had risen by artifice and ability to the highest office of state. He ventured to pay his addresses to a kinswoman of the emperor himself, and though he awakened thereby the emperor's jealousy, he seems not to have been unsuccessful. At all events, he effected the removal of some of his master's nearest relations, among them the luckless Agrippina, and the common rumour may not have been ill founded, that he aspired in his daring ambition to a share in the empire, and eventually to the succession. But Tiberius, it seems, had dissembled with Sejanus, as with others, and had allowed him to suppose himself more necessary to his master's policy than he really was. Once fully persuaded of the extent of his views and of his own danger in consequence, Tiberius had the energy to strike him down at a blow. Sejanus was in the city, in the ripeness of his power, surrounded by the senators and the soldiers; and Tiberius, now old and feeble, with scarcely a guard about his person, in his distant retreat, with only his ships to rely on for escape if the blow should fail. Great circumspection and artifice were required, but the tyrant was equal to the crisis. The missive which he sent to be recited in the Senate, in which he flattered and honoured his victim till he had thrown him completely off his guard, and then ordered the consul to arrest him, is celebrated as a masterpiece of king-craft. Sejanus fell amidst the execrations of the senators, who up to this moment had caressed him, and the people declared, with thoughtless exultation, that the state had been saved in the safety of Tiberius.

Fall of Se-
janus,
A.U. 784,
A.D. 31.

The citizens indeed were willing to persuade themselves that the tyranny under which they had lately suffered was due to the vile counsels of the upstart favourite, rather than to the evil disposition of their emperor himself. They entreated Tiberius to return to Rome, and administer the government in the presence of the people, as their potentates had done before. That the head of the Roman commonwealth should lead the life of a voluptuous loungee in the Grecian villas of Campania, seemed to them monstrous and degrading. Of a noble Roman who could so forget his country, and his duty to it, any horror might easily be believed, any crime, or vice, or unnatural torpi-

The ac-
count of
Tiberius's
personal
vices.

Political History.

tude, might be plausibly imputed to him. If, then, the account we have received of the vile debaucheries of Tiberius at Capræ exceed any modern instance of human depravity, it is not much more than might fairly be expected from the tongue of popular rumour exasperated at this glaring dereliction of duty and renunciation of conventional principle. Considering the sources from which we seem to have derived them, some shade of doubt must certainly attach to these reputed enormities. But even if we admit them in their fullest extent, we must still acknowledge that, frightful as they are, they may be paralleled perhaps in every particular in the conduct of less notorious personages of heathen antiquity. The cruelty and impurity ascribed to Tiberius belonged to his class as much as to himself, and were exercised by many a noble Roman at home and abroad, among their subjects and their parasites. The horrors of imperial vice have become especially notorious, from the pre-eminence of the personages to whom they were imputed in the histories of the times; but they were not the excesses of imperial power uncontrolled by law, so much as of our common human infirmity unsustained by religious principle. However this may be, Tiberius deserves credit as a ruler, for wielding his authority twenty-three years almost without drawing the sword, and for leaving his dominions in peace and prosperity. His end was precipitated, at the advanced age of seventy-nine, and on a sick-bed from which he could hardly again have risen, by the hands of an attendant in the interest of his grand-nephew Caius Caligula, impatient for the succession, and not without apprehensions for his own life.

Death of Tiberius, A. U. 790, A. D. 37.

SECT. XLI.—THE REIGN OF CAIUS CALIGULA (A.D. 37–41).

Caius Caligula obtains the sole power.

Caius Cæsar, the son of Germanicus and Agrippina, had been bled in his father's camp, and received from the soldiers the familiar nickname of Caligula (from the *boot* or *caliga*), by which he is most commonly known at least in later history. He was adopted by Tiberius on the same footing as a younger Tiberius, the emperor's own grandson. As a few years older than his cousin, he was allowed, indeed, to regard himself as the immediate heir to the empire, though, according to the loose ideas of hereditary succession still current among the Roman statists, Tiberius was considered as having a presumptive claim to be associated with him when he should arrive at manhood. Thus Augustus had delegated a portion of his authority, first to Agrippa, and at a later period to the elder Tiberius. His successor, indeed, had never prevailed on himself to make any such surrender of his sole autocracy, nor was it possible, perhaps, for two kings to reign together again at Rome. From the first the young Caius, who assumed the empire at the age of twenty-five, felt the deepest jealousy of his unfortunate kinsman, and it was not long before he invented a pretext for destroying him. At first, indeed, no prince was ever more popular than this child of the people's favourite, succeeding as he did to a morose and odious tyrant. During the first months of the new reign both prince and people seemed to be equally intoxicated. The provinces partook of the exultation of the citizens. When the furious dissipation into which the young man plunged had prostrated him with an alarming illness, the Romans and their subjects combined in the expression of the deepest distress, and in frantic vows for his recovery. This assurance of his people's devotion seems to have removed from its object all sense of shame or apprehension. He indulged in every excess of vice and turpitude without scruple. Utterly devoid of the conscious reserve which had induced Tiberius to veil his indulgences from the prurient curiosity of his countrymen, Caius was equally free from the jealous fears which harassed his predecessor. Whether from the wanton gaiety of his disposition, or from

His licentiousness and tyranny.

a touch of actual insanity, he had none of the cowardice which generally accompanied tyranny. From the second year of his reign he continued to provoke the patience of the world by a series of indignities and injuries such as the provinces might have sometimes suffered from the worst of the proconsuls, but such as had never yet fallen upon the Romans themselves. His cruelties and oppressions were indeed generally inflicted upon the nobles, who had lost the respect and could no longer command the affection of the populace, while the populace itself he soothed and caressed by the profuseness of his shows and largesses; yet his blows fell sometimes among the crowd also, and the Romans shuddered at the terrible exasperation with which he uttered a wish that the whole people had but one neck.

Political History.

The frantic dissipation in which this Cæsar indulged kept his mind and body in constant fever. His haggard countenance, his shattered frame, his agitated gait, his frenzy by day and sleepless perturbation at night, as described by the historians, form one of the most fearful pictures on record of the consequences of guilty indulgence. Shocking as such a picture must be in the case of a private individual, in a king of men—the tyrant of a hundred millions of fellow-creatures—it is truly awful. Caius had imbibed from the Jewish chief Agrippa, the companion and counsellor of his early years, the oriental idea of monarchy. He scouted the restraints of Roman law and usage; he tore away the veil of republican forms by which Augustus and Tiberius had disguised the real extent of their power; he determined that all his subjects should know that he was a despot, and that his will was practically as unrestrained as that of a king of Babylon or Alexandria. He scorned to dwell in a mansion suitable to a Roman noble, such as the palatium of Augustus and Tiberius, and covered a large part of the Palatine Hill with additional buildings, which he connected with the Capitol by a bridge flung boldly across the valley of the Velabrum. Over this bridge he marched in pomp to the temple of Jupiter, seated himself by the side of the god himself, and affected to whisper in his ear, and suggest the counsels of Providence. He aped the dress and style of the deities himself; and when his sister Drusilla died, with whom, like an eastern potentate, he had lived in incestuous commerce revolting to the feelings of the Romans, he declared that she had become a divinity, and required his subjects to pay her worship. He encircled his own head with the oriental diadem armed with spikes or rays, the well-known symbol of divinity in the East. Augustus had been honoured after his death with a temple and a priesthood at Rome—a tribute of respect which the Senate had refused to Tiberius; but had Caius lived a little longer, we can hardly doubt that he would have insisted on receiving divine worship himself from the citizens, as well as from the subjects of the state.

Despotic character of his policy.

The extravagances of this wretched tyrant were chiefly shown in the games of the circus, in which he took a

frantic pleasure, so as to threaten, it was said, to make his favourite horse a consul. The bridge of boats which he constructed across the Bay of Puteoli, for the sake of driving in triumph upon the ocean, was an extraordinary freak of reckless ostentation. The story, that instead of leading his troops, as he had promised, into Britain, he drew them up with great parade on the shore at Boulogne, and then bade them pick up shells, and return laden with "the spoils of the ocean" to Rome, may possibly be a misrepresentation. The account we have received of his expedition into Gaul, and his aimless enterprises in that quarter, is not much to be relied on. The commander of the forces on the Rhine had ventured to defy Tiberius in the old age of that timid emperor, and it was an object not unworthy of the boldness of Caius to throw himself in person into the camp of his formidable lieutenant, and inflict

His extravagances.

Expedition into Gaul, A.D. 40.

Political
History.

condign punishment upon him. We are loath to believe that a prince who could act so promptly and courageously on a suitable occasion, should have debased himself by the wretched trivialities imputed to him in connection with this expedition; nevertheless, we must remember that we are reviewing the career of one who can hardly be regarded in any other light than as a madman.

Caligula
assassin-
ated, A.D.
41.

This career, disgusting as it is, was happily cut short before the end of four years by the blows of an assassin. A madman in the possession of unlimited power must be considered beyond the pale of moral sanctions; and if there was no other way to remove him, no one would judge severely the man who wielded even the dagger against him. But Caius was not doomed to the death he so amply merited by the decree of the outraged Senate, or the general rising of an indignant people. He had provoked a domestic enemy in the person of an officer of his guard, and he was stabbed by a band of private conspirators in the vault of a passage in his palace. The blow was quite unexpected, and surprised both the Senate and the imperial family alike. There was none to claim the succession on the one hand; there was no plan for assuming the government on the other. After a moment's delay, the consuls, finding the throne vacant, proclaimed the restoration of the republic; but the citizens were wholly unprepared for such a revolution, and the soldiers of the guard, anxious only for the largess with which the accession of a new emperor must be accompanied, seized on Claudius, the uncle of the deceased, whom they found by accident lurking in a corner, carried him on their shoulders to the camp, and announced to the still trembling senators that they had chosen a chief for the republic.

SECT. XLII.—THE REIGN OF TIBERIUS CLAUDIUS (A.D. 41–54).

Claudius
follows the
political
example of
Augustus.

Resistance was perhaps impossible; none at least was attempted. The consuls took at once the oath of devotion to the new emperor, and the Senate and people followed their example. Tiberius Claudius was brother to Germanicus, and uncle to Caius. He had reached the age of fifty, during which his natural taste for retirement and study, as much perhaps as the jealousy of the heads of his family, and the weakness of mind and body currently imputed to him, had kept him almost entirely in a private station. He had applied himself to abstruse studies, and composed elaborate treatises, but he had made no acquaintance with the conduct of affairs, either military or civil. He was addicted to women, and had generally allowed himself to be swayed by them and by the freedmen who surrounded them. His accession to power was regarded as no augury of good government by any portion of his subjects: it was a relief, however, to be rid of the furious caprices of their last tyrants; and the pledges Claudius gave the Senate of deference to their counsels were accepted with grateful acknowledgments. Though betrayed occasionally into acts of harshness and cruelty towards men of distinction through his weakness rather than tyranny, Claudius continued throughout his reign to respect the character of the senatorial order. His principle of government was to follow the example of Augustus,—to restore and confirm ancient usages, to maintain the ancient laws, to enact the head of the family rather than the emperor of the state. His assiduity in business was extraordinary; presiding day by day at the tribunals, he tired out, infirm as he was, the judges and officers; and if at the close of an exhausting session he indulged with indecent avidity in the pleasures of the table, his excesses may be partly accounted for and excused by the exhausting labours to which he had devoted himself. His manners and his measures were equally those of a pedant on the throne; his awkward figure, rendered more uncouth by the effects apparently

of a paralytic seizure, gave occasion for much ribald mockery; but on the whole we must in fairness pronounce that his efforts at governing the world under such formidable disadvantages were truly meritorious, and his failure in a task to which he was constitutionally unequal a matter of commiseration rather than of ridicule.

Political
History.

Nor was it only in the city and on the judgment-seat that Claudius felt it incumbent on him to carry out the complete idea of the prince and emperor of the Romans. Augustus had placed himself at the head of the legions; feeble though he too was in bodily frame, he had fought against the enemies of Rome, and merited the glories of a triumph. The successor of Augustus must not shrink from following him in this field also. Cæsar had imposed a tribute on the Britons; Augustus had insisted on its payment; but these obligations had been long evaded, and the threats of Caius had resulted in ridiculous failure. Claudius determined to seek his laurels in an enterprise against these distant enemies. He sent a lieutenant to secure a landing and make good a footing on the island; but he followed himself without delay, traversing the whole of Gaul at the head of his army; and after crossing the Thames he succeeded in bringing a British potentate to an engagement, and obtaining a decisive victory. The foundation of a colony at Camalodunum, or Colchester, secured the conquest of the southern part of Britain; and Claudius fully deserved the triumph with which his ambition was gratified. This success, though shaken by a later disaster under the emperor that followed, seemed to be completed by the capture of the bravest of the Britons, the renowned Caractacus. It does honour to Claudius, unless it may be ascribed to the greater humanity of the times—inhuman as in too many respects we must still regard them—that, instead of being strangled in his prison like Jugurtha or Pontius under the republic, this fallen enemy was treated with the consideration due to his valour, and suffered to live in freedom at Rome.

The contempt with which the character of this unfortunate emperor has been loaded has been chiefly derived from the mishaps of his domestic life, and the fatal effects of the influence exerted over him by his worthless consorts. He had been more than once married as a private citizen; after he became emperor he united himself to Valeria Messalina, a woman whose name has become a byword for the excess of female dissoluteness. In his relations to this wanton woman, Claudius is represented as a miserable wittol, cajoled by a partner who hardly deigned to throw a veil over her flagitious infidelities. To her fatal sway was imputed many acts of cruelty and rapacity, covered by the name of the emperor. If she ruled him, she shared her influence with Pallas and Narcissus, freedmen and favourites of his court, who amassed vast fortunes by the crimes to which they extorted his consent. At last, to the relief of the Roman world, these hateful confederates fell out among themselves. Narcissus vowed to effect the ruin of Messalina. Her own conduct, now become utterly unguarded, soon furnished an opportunity, which he was bold enough to seize. Having fixed her roving passions on a comely young noble named Silius, she had the incredible audacity, so we are assured, to insist upon his publicly espousing her. Besides the monstrous impiety of the act in the eyes even of that careless generation, it was an open avowal of treason. Silius could have no other course but to overthrow, by force or fraud, the prince whom he had so grossly outraged. Not without difficulty did Narcissus open the eyes of Claudius to the insult he had sustained; with still greater difficulty he inspired him with courage to inflict a suitable punishment. The freeman insisted, and the emperor yielded: Silius and Messalina were arrested and slain; and the execution was hardly over before the stupidest of husbands was found to have forgotten all about it.

Domestic
troubles of
Claudius.

Messalina
and Silius.

Political History.

Political History.

Agrippina.

Such is an outline of the story related or confirmed by all our authorities. It is evidently derived from one source; but whether that source be the actual truth of the occurrence, or the fabrication of one whose position was such as to confer on it unmerited authority, may still be considered as doubtful; for Messalina was succeeded by another wife, Agrippina. Messalina left a son, Britannicus. Agrippina had also a son, Domitius. The great object of this last of the empresses was to advance the fortunes of this son by an earlier marriage, to secure for him the succession over the head of the orphan Britannicus. The wickedness of this intriguing woman is at least as well accredited as Messalina's, and it may easily be supposed that she would scruple at no falsehood to exasperate her husband against her predecessor, and to persuade him that Britannicus could not really be a son of his own begetting. However she may have represented the affair to Claudius, it is probable that in the memoirs of her times, which she is known to have written, she coloured them to suit her own purpose and deceive the citizens. The child of Messalina was to be disparaged in their eyes as well as in the emperor's, and the narrative of a palace scandal from the pen of a mistress of the palace was likely to meet with ready acceptance from the prurient curiosity of the Roman people. It is no unreasonable scepticism to withhold implicit reliance from the story of Messalina, even though told us by Tacitus.

Death of Claudius, A.D. 54.

The young Domitius was two or three years older than Britannicus, and when Claudius was persuaded to adopt him, he became, under the name of Nero Cæsar, the presumptive heir to the purple. Thus far successful in the accomplishment of her cherished object, Agrippina was now only solicitous to anticipate a reverse of fortune, and for this end she did not scruple to compass the death of the now dotting emperor. She caused poison to be administered to him in a dish of mushrooms, and he died from the effects of it in her presence, almost at table, in the year of the city 807. She continued to conceal his decease till she had completed her arrangements for securing the succession to her son, who was led to the camp by Burrhus, the prefect of the prætorians, and accepted without hesitation, on the promise of an ample donative, as the heir of Claudius and the descendant of Germanicus. The Senate hastened to ratify the choice of the soldiers.

SECT. XLIII.—THE REIGN OF NERO (A.D. 54–68).

Domitius Nero, the favourite of the people.

The exultation with which the accession of Caius had been received on the demise of Tiberius, was renewed with increased favour on the auspicious transfer of imperial power from the old imbecile Claudius, to the gay young prince who now united the suffrages of all classes of citizens. With their late emperor, whether from the real defects of his character, or from the misrepresentations of it with which their minds had been abused, the Romans had become thoroughly disgusted; but the youth and beauty of Nero had made a very favourable impression on them, and this was heightened by the artful terms in which his accomplishments, his abilities, and his temper had been described to them. Seneca the philosopher, a man of known acquirements, and at the same time of popular manners, had been given him for his tutor. The young man had been bred in the school of wisdom and morality, which the sage seemed to find means to reconcile with the tastes and habits of the day. Nero was to combine the man of virtue with the man of fashion, and the world was invited to admire in his person the harmonious results of an alliance between things which the precepts of the schools and the experience of men had hitherto pronounced incompatible. But the world accepted the announcement without misgiving, on the word of the philosopher, and echoed the applause with which he greeted the work of his own hands, anticipating in the advent of this

VOL. XIX.

favourite of fortune the return of a golden age, the descent of an Apollo upon the earth.

Nero possessed perhaps some graces of person, and some natural abilities. He was not devoid of natural feelings, of kindness, and affection. With an impulsive temper, and a rather feminine susceptibility, he was easily led to seek the applause of those around him, and to shun their disapproval. The objects of interest which his tutor set before him were no doubt pure and virtuous, such as the love of his kindred, respect for his mother, regard for the common weal and for the pleasures of the people. But if Seneca led his pupil well, he exerted no moral power in controlling him. From the moment that the youth began to press upon the reins, Seneca relaxed his restraint, and gave full course to the indulgence of his passions. He hoped to retain a little influence by yielding much, and for some years after his accession the force of habit still inclined the restless pupil to lend an ear to his occasional suggestions. The first five years of the new reign, the *Quinquennium Neronis*, as this term was called by way of favourable distinction, have been celebrated as a period of really good and conscientious government; nevertheless, they were marked by crimes of the deepest dye, and no wise man could anticipate from the weak and wicked prince who committed such enormities any other development of his career than the frightful tyranny which actually succeeded to them.

The "Quinquennium Neronis."

Notwithstanding the marked applause with which Nero's accession was greeted by the Senate and the people, it was soon suggested to him that he might have cause of fear in the victim whom he had supplanted. The feelings of nature were too strong for those of custom, and still regarded Britannicus, the actual son of the late emperor, a more legitimate claimant of his throne than Nero, whom he had only adopted. The usurper was easily persuaded that it was necessary to remove the rightful heir; and by the agency of the notorious poisoner Locusta, the child of Messalina was murdered, not, it may be feared, without the sanction of Seneca himself. Nero was married to Octavia, the sister of Britannicus; but this creature, though celebrated both for her beauty and her virtue, gained no ascendant over him. He fell under the fascinations of the intriguer Poppæa, whom he took from his friend Otho, and under whose influence he engaged in the horrible design of ridding himself of his own mother. The rivalry between Agrippina and Poppæa had continued for some time. In her eagerness to retain her authority in the palace, the mother, it was said, had actually tempted her wretched son to incest; but when disappointed and defeated, she began to set up a rival court, and threatened to divulge the murder of Claudius, and recommend Octavia to the citizens, he was prevailed on to sacrifice her to the anger of his mistress, and what he considered the necessity of his own position. Again, it is reported that Seneca consented to the crime; it is more probable that he was not consulted about it; but undoubtedly both he and Burrhus, who had also the character of a brave and honest man, allowed themselves to justify it when done. Under the mildest view their conduct is without excuse. Nor was it of any avail. The people were horror-struck; the Senate, awakened by some sufferings of their own to the hollowness of their prince's professions of good government, resented it with murmurs and conspiracies. Seneca and Burrhus lost all favour and all influence, and both fell victims in a short time to their master's insatiable jealousy. Seneca, indeed, seems to have entered into a plot for his overthrow, the discovery of which cost the lives of many distinguished nobles, as well as of an old companion of Nero, the republican poet Lucan. The cruelties of Nero were now repeated and extended, falling upon the men most conspicuous for virtue, as well as the noblest and the wealthiest. The murders of Barea Soranus and of

Pætus Thrasea, two of the staunchest professors of the Stoic creed of philosophy, seemed to aim at the "extinction of virtue itself."

Burning of
the city,
A.D. 64
Persecu-
tion of the
Christians.

Amidst these dismal excesses of an unlimited despotism, the reign of Nero is remarkable for a disaster of another kind, of which, though imputed by many voices at the time to Nero himself, the hand of man may fairly be acquitted. In the year 817 Rome was swept by a terrible conflagration, which consumed a large proportion of the whole city. The populace, in their terror and distress, demanded victims, and the emperor suffered the Christians to be convicted on the charge of wilfully destroying it. Against the persons thus designated, of whom there were many now at Rome (but whether they were exclusively the believers in the gospel of Jesus Christ, or, partly at least, included the Jewish sectarians, the followers of false Christs, who had often caused disturbance even in the heart of Italy, is still liable to question), a cruel persecution, and the most cruel of punishments were directed. Death by burning was an ancient punishment of the republic for the crime of seditious incendiarism; and to this death the reputed burners of the city were devoted. They were tied to stakes and consumed in shirts smeared with pitch. The fierceness of the flames thus kindled, added to the horror of the execution, and the brutal levity of Nero in driving his chariot by the light of these human torches, heightened the commiseration to which the fury of the people had been quickly converted; but there can be no doubt that the invention of the pitched shirt was meant to shorten and not to aggravate the sufferings of the victims.

Nero's
licentious
amuse-
ments.

The horror with which Nero's cruelties were regarded by the Senate was enhanced by their indignation at the levities with which he gratified his own morbid passion for applause, and courted the flattery of the populace. He was devoted to the games of the circus, and insisted on, outraging decorum by driving the chariot in person. He was not less addicted to the amusement, reported equally vile by the graver citizens, of playing and singing in public. It was said that in the midst of the general dismay at the great conflagration he had witnessed the scene from the top of a tower in his palace, and performed upon his flute the drama of the sack of Troy. This piece of unfeeling impertinence, followed by the avidity with which he seized on the space laid open by the flames to construct the immense extent of his "Golden House," gave colour to the suspicion above noticed, that he had actually caused the fire, or had at least forbidden its extinction. Soon after this event he quitted Rome to seek new laurels among the games and shows of Greece, where he expected to find his peculiar talents better appreciated than by his own morose or ignorant countrymen. He travelled from theatre to theatre, and won all the applauses and all the chaplets which Athens, Corinth, and Olympia could bestow. During the course of his reign foreign affairs had proceeded on the whole prosperously. A disaster in Britain had been retrieved. Some successes had been gained, by negotiation rather than by arms, over Parthia; and Nero had got much ridicule by claiming a triumph for them. His ablest lieutenant, Corbulo, he had wantonly put to death, when the breaking out of a revolt in Palestine demanded his best generals and his bravest legions. The conduct of this war was entrusted to the veteran Vespasian; but when at last a revolt broke out against him in his own army in Spain, he found himself without men or commanders to meet it. While he was still lingering in Greece, Galba, at the head of his forces, was marching towards Rome. The troops stationed in Gaul were induced to join the movement, or to observe neutrality. Nero returned in haste to Italy; but at the first news of some temporary success relapsed into his frivolous dissipations. The arrival of each succeeding courier roused him to paroxysms of alarm or confidence;

The "Gold-
en House."

Death of
Corbulo.

but he made no effective preparations to repel the danger, till the Senate, seeing the defencelessness of his position, summoned courage to anticipate the arrival of the avenger, by denouncing him as a public enemy, and setting a price on his head. The wretched tyrant evinced the utmost pusillanimity in this crisis of his fortunes. He fled from the palace in disguise, but despaired of ultimately escaping, and after much hesitation, and with much childish complaint, at last gave himself the death-blow.

SECT. XLIV.—WARS FOR THE SUCCESSION (A.D. 68–69).

Galba, as he advanced towards Rome, declared that he had turned his arms against the tyrant in the interest of the Senate, and that he left to that venerable body the future settlement of the empire. He had lived to a great age in the tranquil discharge of high civil and military functions; and it is probable that he had first commenced his movement for his own safety rather than from motives of ambition. But when his enterprise was crowned with success, he could not doubt that the Senate would offer the empire to him, nor had he any scruple in accepting it. With Nero the last of the imperial race of the great Julius had perished: there remained no chief to whom the proconsul owed obedience. Galba was released from the military oath which bound him to the successor of Cæsar and Augustus, the descendant of Drusus and Germanicus. He accepted the honours proffered him, and having quelled all opposition to himself, and learnt the discomfiture of some military pretenders in the provinces, he entered the city at the head of his forces, and assumed the empire not less as the nominee of the army than as the chosen of the Senate. Servius Sulpicius Galba was a man of good family; the heralds tried to connect him with a mythological ancestry; but the transfer of empire from the race of the Julii, of whom three at least had been enrolled among their tutelary deities, gave a shock to the national feeling from which it never recovered. Never again could the Romans surrender themselves to the illusion, that their emperor reigned by right of a divine descent; the attempt to establish such a descent, though made in favour of some later rulers, never again laid hold of the national sentiment, and established itself as a popular superstition. As regarded the successor to Nero, it was wholly futile. The manners which Galba brought from the camp to the palace were rude and harsh; his principles were austere; he was frugal himself, and parsimonious in relation to others. He refused the soldiers their expected donative; and to both the soldiers and the people showed himself a strict disciplinarian. Such a commencement of a new reign—a reign founded on favour, not on right—irritated all classes, and made them apprehend a severity more galling than the capricious cruelties of the late tyrant. Warned, but not dismayed at the murmurs he heard around him, Galba selected an associate more young and vigorous than himself, named Piso; but intrigues were already in motion against him; Otho, once the confidant of Nero, and as profligate as his master, was tampering with the prætorians. Galba had exercised his power but one fortnight when this conspiracy burst upon him, and unsupported by the people, undefended by his own guards, he fell by the swords of a mutinous soldiery.

Galba pro-
claimed
emperor.

The successor to Galba was proclaimed by the prætorians without even a pretence of consulting the senators, who tacitly acquiesced in the appointment, but abstained perhaps as far as they could from actually acknowledging it. While the emperor assumed the privilege of striking the gold and silver coinage, the privilege of issuing the more vulgar copper currency was accorded to the Senate. The fact, that no copper coinage of Otho's brief reign has been discovered, may be taken to show the reluctance of this outraged body to stamp their approval of his usurpa-

Death of
Galba, and
accession
of Otho.

Political History.

tion on the public money. But however this may be, the usurper's career was speedily cut short. The legions in the north of Gaul had already declared against Galba, and put Aulus Vitellius at their head to contest the empire with him. The report of Galba's death and Otho's succession made no difference in their measures. They wanted an emperor of their own creation, from whom they might receive a largess worthy of their services; perhaps they already thirsted for the plunder of Italy and Rome. Otho, though long steeped in luxury, was by nature gallant and high-spirited. He accepted the challenge with alacrity, and went forth to the Cisalpine to encounter the enemy. But his temper was light and capricious, and on the first check received by his followers, he resolved to put an end to the contest, of which he was weary rather than afraid, by falling on his own sword. The victory of Bedriacum, thus crowned by the self-sacrifice of his rival, there was nothing to prevent or delay the succession of Vitellius to power, enforced by the swords of his impatient soldiery, and accepted with entire submission by the Senate. At the head of his Gauls and Germans, the conqueror entered the city in military array and accoutrements; and Rome, for the first time, felt herself in the power of an undisguised invader.

Battle of Bedriacum, and death of Otho. Accession of Vitellius

Vespasian proclaimed in the East.

But the same high tide of revolution which had wafted Galba and Vitellius to Rome on the wave of military insurrection was preparing the triumph of yet another competitor for the purple. While the armies of the West were contending for the substantial rewards of nominating to the empire, the legions which occupied the opposite portion of the Roman dominions were not less eager to strike in with a claim of their own. The progress of the war in Palestine retarded their movements; but at last, suspending though not abandoning these important operations, which also promised abundant glory and plunder, their leaders agreed to set up Vespasian, chief in command among them, as the worthiest candidate for the empire. Vespasian indeed remained for a time in Egypt to secure the resources of that important province, and placed his son Titus in charge of the war against the Jews; but his friend Mucianus led a mighty force through Asia and Greece into Italy, and his lieutenant Antonius Primus engaged the Vitellians in the Cisalpine with the first division of his armaments. Vitellius was hardly seated in his palace, where he was disgracing himself by the vilest sensuality, and betraying a total incapacity for government, when his repose was shaken by the attack of these new assailants. A second battle at Bedriacum broke the strength of his forces. Antonius, anxious to secure the full merit of completing his success before Mucianus could come up with further reinforcements, followed on the heels of the Vitellians, and the partizans of Vespasian mustered so strongly in the Senate-house and the Forum that Vitellius, sluggish and pusillanimous, hastened to proffer his submission. Sabinus, the conqueror's brother, dictated the terms of his abdication; but his soldiers, enraged at his cowardly desertion, still retained their arms, and made a tumultuous night attack on the position of their adversaries in the Capitol. The venerable citadel of the republic was not regularly defensible. Climbing over the roofs of the adjoining houses, and flinging torches before them, they involved the august temple of Jupiter in flames, and burst in the confusion into the inclosure. Sabinus was captured and slain; Domitian, a younger son of Vespasian, escaped in disguise. Vitellius was compelled to resume the purple; but Antonius had now reached the outskirts of the city, and his opponents, who went forth without a leader to encounter him, were beaten back step by step within the walls, which he entered along with them, filling the streets with slaughter. A remnant of the Vitellians withdrew into the prætorian camp, but their last stronghold was speedily stormed.

Burning of the Capitol.

Their wretched emperor lingered about the palace, uncertain whether to fly or sue for mercy, but was seized by the infuriated soldiery, and slaughtered with many indignities. Mucianus, following in the rear of Antonius, and bringing Domitian with him, assumed the government in the name of Vespasian; and Rome once more settled down in the hope of tranquillity under the new usurper.

Political History. Death of Vitellius.

SECT. XLV.—REIGN OF VESPASIAN (A.D. 70–79).

Titus Flavius Vespasianus, the founder of the Flavian Accession dynasty, had been saluted emperor by his soldiers in the East in July 822, and it was from that era that the years of his government were technically numbered; but his accession to power at Rome dates from the first days of 823 (A.D. 70), when he assumed the consulship, and received all the ensigns of imperial sovereignty from the Senate, though still absent from the city. He allowed some months to intervene before making his appearance in the capital, choosing perhaps to leave to his lieutenants the invidious task of punishing the most obnoxious of the citizens, and smoothing his entrance into power. When he arrived, about the middle of the year, he accepted the submission of the Senate with complacency, and assured it of his favour and consideration. He proclaimed the advent of a new era of peace, and this announcement was received with the same satisfaction as when Augustus closed the temple of Janus. But the announcement was at least premature, War in while the Jews still maintained, behind the walls of Judea. Jerusalem, their indomitable defiance of the power of Rome. Driven in three campaigns from almost every other stronghold they defended the Holy City with desperate obstinacy. Religious fanaticism supplanted the place of skill or discipline. Though weakened by internal dissensions, they repulsed every attack of the enemy, and submitted to the extremity of famine rather than surrender to the sacrilegious assailant. Exhausted by a long blockade, they were at last overpowered by the perseverance of Titus; their walls were stormed one after another, the inclosure of the temple scaled, and the Holy of Holies given to the flames. The resistance was still protracted for a time in the streets of Jerusalem, and even when the city was taken and razed to the ground, a dying gleam of glory was shed over the fall of Judæa by the defence of Machærus and Massada. But Titus at length completed his bloody task, Fall of Jerusalem, A.D. 70. in which he had exercised relentless severity. On his arrival at Rome he was associated with his father in the honours of a triumph, commemorated by the arch, still existing, which bears his name, and received a share in the government of the empire.

The conquest of Judea had cost Rome a greater effort than any of her foreign wars since the great struggle with Carthage; but such was her energy, such at this period the extent of her resources, that she had continued to conduct it in the midst of the distractions of civil strife, and during the determined mutiny of one of her finest armies. Immediately on the departure of Vitellius for Rome, with a large portion of the Germanic legions, the German and Gaulish auxiliaries in the north of Gaul revolted against their commanders, set up the standard of a Gaulish empire, and succeeded in breaking up the whole of the Roman force in their country. Under the Batavian chief Civilis, they continued to defy the power of the empire till the overthrow of Vitellius allowed the new government at Rome to pour its legions across the Alps. Civilis was beaten in several encounters by the Flavian general Cerialis. Domitian advanced in person into Gaul to support the efforts of his lieutenant; but the resistance of the mutineers was crushed before his arrival on the Rhine, and in the north, as well as in the east, the sway of Vespasian was secured and consolidated.

Mutiny of the Germanic legions. A.D. 69–70

Political
History.

This fortunate soldier held the reign of empire ten years, during which period the Senate was allowed to resume much of its ancient consideration, and the personal virtues of the ruler, his simplicity and moderation of character, exercised a favourable influence on the manners of the age. A re-action set in, from the reckless extravagance fostered by the example of Nero. The fortunes of the great nobles had been broken down by the exactions of that rapacious tyrant, and had suffered still more perhaps in the confusion of the civil wars; many of the chief families had become extinguished, and their place in the Senate, and in the high offices of the state, was supplied by men of meaner birth and provincial extraction. Raised by Vespasian to their new dignities, these men took Vespasian for their model, and introduced into their households the fashion of economy and self-control. Though rude and unpolished himself, the soldier-emperor paid respect to letters, and established throughout his dominions a corps of salaried professors. On the other hand, he banished the philosophers from Rome; but to this harsh measure he was perhaps amply provoked by the pertinacity with which they preached disaffection and rebellion. Vespasian had none of the finer qualities of the high-bred Roman aristocrat; there was nothing genial or magnanimous in his character; once or twice he acted with revolting cruelty. But his rule was marked on the whole by equity and mildness, and his reign deserves to be noted as one of the brightest periods in the annals of the empire.

SECT. XLVI.—REIGNS OF TITUS AND DOMITIAN (A.D. 79–96).

Accession
of Titus.

Vespasian had prudently erected a temple to his predecessor Claudius, and he received a similar honour after death from his successor Titus. The Flavian family was formally admitted among the tutelary divinities of the Roman people; but the hero-worship of the emperors was a service from which the life and spirit had now wholly evaporated. The conqueror of Judea, who now occupied his father's place on earth, bore the character of a mild and studious philosopher. His conduct indeed in the field had been marked with the cold-blooded cruelty common to all the Roman generals, but towards the citizens, and especially the senators, he displayed the moderation and self-control which always commanded their warmest acclamations. Out of deference to the prejudices of his countrymen, he refrained from marrying the Jewish princess Drusilla, of whom he was passionately enamoured; and this condescension to national feelings gained him perhaps no less applause than the sentiment he was said to have once expressed, that "he had lost a day" in which he had performed no special act of virtue. There seems to have been some softness, and perhaps some effeminacy, in the character of Titus. He was addicted to voluptuous habits; he was prone to indulge in expensive ostentation; and had he not succeeded to a hoard of treasure amassed by his father's economy, which he did not live to exhaust, he might have resorted at last to the cruelties of a Nero to supply his prodigality. Though the Romans agreed in entitling this prince the "delight of the human race," they admitted that he was saved by an early death from the snares of a position to which he might have proved unequal. Titus died of a fever, his frame having been weakened by an immoderate use of the bath, after a short reign of only two years, in 834 (A.D. 81).

Death of
Titus.

Domitian.

Domitian, who succeeded to his elder brother, had never been regarded with the same hope and favour by the Romans. His head had been turned by the glories which accrued to his family in his tender years. During the short interval in which he had exercised power before his father's arrival at Rome, he had given the rein to his youthful passions, and the evil nature thus early developed in

Political
History.

him had been repressed but not eradicated by the control of Vespasian. The Romans declared that he had shown the cruelty of his disposition in early youth by his passion for killing flies. He seems to have had some taste for literature; he was himself a poet; he encouraged and rewarded poets, and instituted poetical contests and prizes. He persecuted the philosophers, indeed, like his father; nevertheless the reign of Domitian did not fail to produce many brilliant writers and enduring works of genius. But the temper of this emperor was weak and cowardly; and after a few years of professed deference to the Senate, he grew weary of the dissimulation he had practised, exacted from them the grossest adulation, watched all their movements with anxious jealousy, tormented them with his miserable fears, and decimated them, on the slightest pretext, with remorseless barbarity. He was himself tormented with the desire of emulating his father and brother in their military achievements. With this view, he did not hesitate to exchange the pleasures of the capital for the hardships of war. He made one campaign beyond the Rhine, and another beyond the Danube. He pretended to obtain successes, and to celebrate triumphs over both the Germans and the Dacians; and his equestrian statue, one of the most magnificent works of art at Rome, represented him trampling victoriously on the captive enemies of his country. Whether really satisfied or not with the applauses he demanded from the citizens, he could not bear to witness the genuine glory of a lieutenant. During the latter years of Vespasian, and through the short reign of Titus, the gallant Agricola, one of the best of the Roman captains, had conducted a series of campaigns in Britain. The Agricola in country south of the Humber or the Tyne had been already reduced; but Agricola undertook to complete the conquest of the island, which he was the first to circumnavigate. In the course of eight years he penetrated to the foot of the Grampians, and finished his career of victory with the defeat of the Caledonian Galgacus. He drew a line of forts from the Firth of Forth to the Clyde, which was strengthened at a later period, and established as the boundary of the Roman possessions. But he would not have rested here, with his work half accomplished, had not the emperor suddenly recalled him to Rome, and reminded him of the danger of making himself too conspicuous among the subjects of so pusillanimous a master. He conducted himself at Rome with becoming modesty and reserve; but the jealousy of the tyrant was not to be appeased, and his death, which speedily followed, was too surely attributed to poison.

Domitian had purchased the favour of the populace by shows and largesses, but at the expense of the nobles, whose estates he confiscated; and as his enemies multiplied and his fears increased, he was constrained to secure the support of the soldiers by raising their pay, and indulging their indolence and vanity. The guards had now become well aware of their position as the real masters of the city and of the empire. Their vanity and their licentiousness were almost equally odious to the citizens, over whom they domineered with impunity. The life and power of the emperor were in their hands, and he was obliged to wink at their excesses. They could only be restrained by the strong arm of a soldier like themselves. They had quailed before veteran Vespasian,—they had respected the victorious Titan; but Domitian, whose futile pretences to military prowess they despised, could only retain their swords by yielding immediately to all their caprices. Thus supported, however, the nobles, now trembling daily for their lives, could not venture to assail him. He continued to persecute them with unceasing barbarity, while himself so apprehensive for his own safety that he shut himself up in apartments mirrored on every side, and so thickly carpeted that his footfalls could not be heard beneath. At

Political History.

last, however, vengeance overtook him from the centre of his own palace. He was wont to inscribe on his tablets day by day the names of those he meant to put to death, continuing to treat them, till the moment arrived, with attentions which disarmed all suspicion. An accident discovered the fatal record to the Empress Domitia, who was dismayed at finding her own name set down in it, together with those of others in high office about the emperor's person. To these she imparted the secret; and they all conspired together to save themselves by assassinating their treacherous master. The tyrant of Rome fell by the hand of a Greek freedman; and with him the line of the Flavian emperors came to an end. He left no children, nor would the indignant senators, who met to nominate a new ruler before the guards could recover from their consternation, have endured another scion of a stock now rendered detestable to them. Domitian was the twelfth of the Cæsars, a name or title which the Flavian emperors had continued to bear, and which was still perpetuated in their successors; but the accident, perhaps, of the *Lives of the Cæsars* by Suetonius terminating with him has limited its special application in popular language to these twelve only.

Death of Domitian, A.D. 96

SECT. XLVII.—REIGNS OF NERVA AND TRAJAN (A.D. 96–117).

Nerva chosen by the Senate.

The prætorians were irresolute, the populace was indifferent; and when the Senate declared that Cocceius Nerva, an aged veteran of high birth and character, should succeed to the chief place in the state, his election might be regarded as ratified by the suffrage of the Roman people. But Nerva, it was remarked, was the first of the emperors of Italian, not of Roman parentage. His family came from Narnia, in the Umbrian territory; and he might still, it seems, be stigmatized as a foreigner, though the Italians had now enjoyed Roman citizenship for nearly two centuries. In this respect the new appointment of the Senate was considered by some as a striking innovation on the ideas of antiquity. It was remembered, however, that the elder Tarquin, one of the most popular of the kings, was by birth an Etruscan; and a saying was current among the curious in such matters, that the Romans had generally prospered most by their native genius under foreign rulers. But such reflections as these, delivered to us by some of their latest writers, were no doubt the sophisms of another age: at the moment, the citizens thought little of the origin of their new emperor; they were occupied with feelings of vengeance against the slaughtered tyrant, whose images they overthrew, while the Senate decreed that his "acts" should be abolished, and the honour of the apotheosis refused to him. The man of their choice was pledged to support their authority and respect their persons. Nerva bound himself by an oath that no senator should suffer death during his reign; a pledge which was formally repeated by some succeeding sovereigns. This was the charter of the Roman constitution under the new dynasty, which depended only on the word of the emperor, but was preserved inviolate at least by Nerva and his next successor. Under this pledge of personal safety the senators again raised their heads, and enjoyed a considerable share of real authority in affairs. Nerva, indeed, was a man of no great strength of character, nor were his health and vigour of body such as to allow him to enter on any struggle with the patrons who had advanced him to the head of the commonwealth. The Senate, however, on their part, fully acquitted themselves of their share in the compact implied between them, exalting the natural mildness and moderation of his temper as the highest sense of justice and most unbounded clemency. It mattered little to them that the poor old man surrendered to the clamours of the prætorians the freedmen who had slain Domitian; and when he himself put swords into the hands of some

nobles whom he knew to be conspiring against him, they extolled what was perhaps mere conscious helplessness as the most magnanimous intrepidity. It was in the interest of this class that the legislation of Nerva seems to have been principally conceived. He enacted rigid laws against the informers, and screened the senators from delation, not in cases of treason only, but of other criminal charges; while he enforced the utmost severity of the barbarous law of Rome against the slaves of their households. The reign, however, of this prince did not last long enough to try the principles on which he conducted it. He died, after holding power a little more than sixteen months, but not before he had conferred Nerva, the greatest of all boons on the Roman empire, in the choice of the best and ablest of his subjects to succeed him.

Political History.

Death of Nerva, A.D. 98

This man was M. Ulpius Trajanus, a native of Italica in Spain, distinguished for his bold and straightforward character, as well as for his military capacity. It was for these qualities, and not for his rank or riches, for he was the son of a plain officer in the armies of Vespasian, that the emperor chose him for the support of his own throne, and adopted him into his family. This was, moreover, the best way of securing the tranquil transmission of the empire on the vacancy which might soon be expected to occur. Trajan was in command of the forces at Cologne at the time of Nerva's death; but not only the Senate and people, but the prætorians and the soldiers generally, acquiesced with perfect satisfaction in the announcement of his succession. He seems, indeed, to have been personally popular with all classes; nor did he, throughout the whole course of his reign, seek to ingratiate himself with any one at the expense of the others. The accounts delivered to us of this reign, as well as of others of the same period, are unfortunately very meagre. We possess, however, abundant evidence that the Romans, not then only, but for many generations afterwards, regarded it as the brightest epoch in the imperial annals. The Senate continued to enjoy the highest respect and consideration; the people were gratified by shows,—not indeed the aimless extravaganzas of Nero, but the martial displays of the amphitheatre, barbarous and disgusting, no doubt, according to our ideas, yet dignified in Roman eyes by ancient national associations. The government of Trajan is also distinguished by the attention it paid, for the first time perhaps in the political history of antiquity, to the relief of poverty by eleemosynary institutions. The provision it made for the maintenance of orphans in Italy, though we can but imperfectly understand it from the notices which remain, is a marked feature in the public economy of this interesting period. The architectural works of Trajan for the embellishment of the city were conceived on the grandest scale, and executed with no want of taste. He constructed, moreover, the naval stations of Centumcellæ and Ancona. But the bent of his genius was military, and he humoured the passions of the army, as well as his own, by the wars he waged against the enemies of Rome. He avenged the humiliation inflicted on the empire by the Dacians and their king Decebalus, which the pretended triumph of Domitian had failed to disguise, and reduced the countries of modern Hungary and Transylvania to the form of a province. The remains of Roman cities, and the deep root still held there by the Latin language, prove the completeness of the conquest he effected, though his next successor thought fit to resign this tardy acquisition. The Pillar of Trajan at Rome, sculptured with the events of the Dacian war, still exists as another monument of the conqueror's prowess. The emperor carried his arms also across the Euphrates, and annexed to the empire some districts in Mesopotamia. He penetrated into the deserts of Arabia, extending the empire, nominally at least, as far as the city of Medina. It is said that his lieutenants carried the eagles beyond Syene on the Nile, and subjugated Nubia. But these

tion of the
Christians.

conquests, if they really deserve the name, were also surrendered on the death of the conqueror, which took place at Selinus in Cilicia, in the year 870, after a reign of nineteen years and a half.

The chief blot on the character of this able and potent prince is the persecution which he suffered to be inflicted upon the Christians, who were becoming at this period an important element in the population of the empire. By the earlier Cæsars the Jews had been treated with great favour, both in their own country and in Rome. This people had taken the part of Julius Cæsar in their hatred of Pompeius; they had sided with Augustus against Antonius; and thus had been suffered to return to practise their rites unmolested in the city, and to make a great harvest of proselytes among the noble and wealthy classes, particularly of the female sex. Under Tiberius, indeed, and Claudius, their turbulence had subjected them to rigid measures of repression; they had been banished for a time from Rome; but these measures were soon relaxed, and they returned in no less numbers nor less turbulently-disposed than before. In their own country the leaders of these repeated seditions had been known by the appellation of Christs, and when the true disciples of Jesus of Nazareth became first conspicuous in the city, we might expect them to be popularly confounded with the deluded followers of Judas the Galilean, or Theudas, who had made the name of Christ odious to the Roman people. We have seen how Nero gratified the Roman populace by sacrificing the Christians at Rome to their fury, and we have remarked that under this name, not the true disciples only, but the unbelieving Jews also, may possibly have been included. The fierce struggle which ensued in Palestine, ending in the overthrow of Jerusalem and a general dispersion of the native population, exasperated the feelings of the Romans against the Jews, and it is probable that, though the Christians were now of almost every nation under the Roman dominion, the fundamental connection of their religion with that of the Jews marked them as in some sense pertaining to those detested enemies of Rome. Hence every jealous measure directed against the Jews themselves, or against their rites and usages, would apply with equal force to the Christians; the believers might be required at any moment, at the discretion of the rulers and governors, to give a pledge for their loyalty to Rome by swearing in the name of the emperor, or by sacrificing to his genius. This was a simple test, which saved all discussion on the character of the Christians or the merits of their religious tenets; the prætors in the provinces might be anxious to show their zeal for their master by exacting this compliance; they were bound at least to exact it in the case of any person denounced to them as the holder of dangerous opinions, whether specified as Jewish or Christian, and hence we find such inquisition made, and cruel punishments inflicted, both under Domitian and Trajan. The latter prince checked the zeal of his officers by expressly forbidding, as in the case of Pliny in Bithynia, any inquiry for Christians to be made. If denounced, then indeed the test must be applied, but not otherwise. Thus circumscribed, the persecution seems to have quickly relaxed, and before his death, Trajan, with his natural justice and benevolence, resolved to suppress it altogether.

Commence-
ment of
decline in
military
spirit.

Trajan was undoubtedly the greatest of the Roman commanders after the days of Cæsar, and under him the frontiers of the empire were advanced to the farthest limits they ever attained. The legions were never more triumphant; the bravery of the soldiers, the conduct of their officers, never more conspicuous: the military power of Rome was raised perhaps at this epoch to its highest pitch. It may be doubted, however, whether the men who bore the eagles of Trajan were really animated with the same spirit of devotion to the service, of discipline and endurance, as the conquerors of Zama or of Pydna: they won many victories,

but it was over barbarian enemies; and their constancy was seldom tried by defeats. The practice, introduced indeed before, but carried out most systematically by Trajan, of defending the frontiers of the empire by long lines of fortifications, such as that which may still be traced in many places from the Rhine to the Danube, must have contributed to weaken the soldier's reliance on his own strength and courage, and taught him to depend on the shelter of ditches and ramparts. Thus protected, he would soon begin to relax in his attention to drill and exercise. It is probable, indeed, that the immediate object for which these works were raised was not so much defence as employment. The legions on the frontiers had too little occupation. On the Danube they had broken out in dangerous mutinies; on the Rhine they had set up an emperor of their own against the emperor of the Senate. The Roman soldier had been always taught to use the pick-axe as well as the sword; the raising of earthworks and fixing of palisades were part of his business as much as the leaping, running, swimming, and fencing which formed his daily exercise. Every night on march, on arriving at his halting-place, he was required to throw up a wall of turf round his camp before betaking himself to rest. The arrangement and dimensions of the camp are fully set forth by the historian Polybius, from which we may calculate the amount of labour imposed on the legionary in the best age of the republic. But under Trajan we find that a new system of castrametation was in practice, known by the name of its expounder Hyginus, according to which an equal number of men was lodged in an encampment of not more than half the size of those of the Cæsars and the Scipios. We cannot suppose that the armies of the empire carried with them less baggage or required fewer followers than those of the republic; and we can only see in this reduction of the size of the camp a relaxation of discipline, and a concession to the indolence of the legionaries. The walls of Trajan in Germany and Moldavia, and the diminished extent of the Hyginian encampments, are the first visible symptoms of decline in the military spirit of the Romans.

Political
History.

SECT. XLVIII.—REIGN OF HADRIAN (A.D. 117–138).

The wise and vigorous rule of Trajan seems to have Hadrian completely restored the harmonious working of the different nominated orders and classes in the empire. The sovereign authority by Trajan. of the Senate was recognised on all hands; and the emperor, when engaged on his distant expeditions, could leave the reins of government to the consuls without fear for his own power or for the tranquillity of the state. When he suddenly died in a corner of an obscure province, the mere assertion by his wife Plotina, that he had nominated Hadrian his heir and successor, was received without opposition or question; and, in default of sons of his own, it was considered most natural and proper that he should thus endow with the purple a man of known ability and experience, a native of his own province, and allied to his own family. T. Ælius Hadrianus, who really owed his elevation to an intrigue of the palace rather than to the actual choice of his predecessor, was a man whom even a Trajan, the best hitherto of the Roman emperors, might be proud of appointing to succeed him. Though his private conduct was not devoid of defects, and though his temper was eventually spoiled by indulgence, he seems to have possessed on the whole the highest combination of princely qualities that ever graced the Roman purple. Though a brave and skilful captain, he refrained from the unprofitable pursuit of military laurels, and chose rather to abandon the useless and expensive conquests of Trajan than waste the resources of the empire in retaining them. The Euphrates and the Danube became again, and long continued to be, the frontiers of his ample dominions.

Hadrian
abandons
some of
Trajan's
conquests.

Political History.

While he retained the swords of the legionaries in their scabbards, he did not shrink from passing a large portion of his time, as an emperor should do, among them; and whether in the camp or in the field, he set a noble example of abstinence and simplicity. He marched at the head of his troops generally on foot, never in a litter, from one end of the empire to the other; his fare was as rude as that of the meanest soldier; he wore no covering to his head, but he endured without a murmur the oppressive weight of his arms and corslet. But the merits of Hadrian as a commander were far outshone by those he manifested in the conduct of civil affairs. He visited every province in succession, exercising a vigilant control over the local administration, securing to his people the due execution of justice, alleviating their fiscal burdens, adorning their cities with sumptuous edifices, labouring night and day, with the assistance of the ablest counsellors, for the happiness and prosperity of his subjects. Hadrian was the first to undertake the great work of codifying the Roman law, a work which Cæsar had proposed, but which none of his successors had ventured to lay their hands to. This object, indeed, was not destined to be accomplished by any single emperor; but Hadrian deserves the full credit of showing it was practicable by commencing it. In the attitude he assumed towards the religious creeds of his subjects, he proved himself an intelligent statesman. In the absence of any definite views of his own, he displayed an enlightened tolerance of those of others, and relaxed the harsh restrictions which the empire still placed, in the spirit of antiquity, on many foreign superstitions. Unfortunately his liberality deserted him, like so many other philosophers of heathendom, in the presence of Christianity alone. Against the true believers he did not scruple to exercise the rigour of old Roman prejudice. He still confounded them apparently with the Jews, from whom they could not yet be at first sight easily distinguished; and the Jews had alarmed and irritated him by a furious revolt, which, commencing under Trajan, continued to rage far into the reign of his successor, and to demand for its suppression all the energy and unscrupulous cruelty of the ruling people. On the ruins of Jerusalem Hadrian planted the colony of *Ælia Capitolina*, called *Ælia* after himself as the founder, and *Capitolina* after Jupiter of the Roman Capitol, whose shrine he reared on the spot once honoured by the temple of Jehovah. The Jews were now at last finally subdued, and they never made head again against the power appointed to overthrow them.

His energy and prudence.

Persecution of the Christians and conquest of the Jews.

Hadrian's buildings.

The state-religion of the empire was honoured by several monuments of Hadrian's munificence. The temple of Rome and Venus which he erected, the remains of which are still visible between the Forum and the Colosseum, was the largest of all the buildings devoted to the worship of the gods in the city; while that of Jupiter Olympius, which he completed at Athens, the work of a series of governments and princes, was reputed the most magnificent of all earthly shrines, and alone worthy of the mighty being to whom it was dedicated. But while the emperor paid this external homage to the religious sentiment of his people, he did not scruple to outrage it by exalting to divine honours a minion of his own, the beautiful Antinous, who was drowned accidentally in the Nile. Both the compliment and the outrage, however, were regarded probably with equal indifference by the great majority of his subjects, whose notions of the supernatural world were limited for the most part to a belief in omens and incantations, while the outward forms of religion served them merely as a

pretext for the cultivation of art and taste. Hadrian has left another monument to himself deserving of notice in our own island. Consistently with his uniform policy of withdrawing the presidary garrisons of the frontier from the least tenable outposts, he abandoned the forts of Agricola between the Forth and Clyde, and drew a line of military stations, connected with a fosse and rampart of earth, from the Tyne to the Solway: this became now the boundary of the province of Britain.¹ It is probable that he also completed the rampart of Trajan between the Rhine and Danube, which is sometimes called after him the *Limes Hadriani*.

Political History.

With such claims to respect in his public character, it must be confessed that Hadrian showed much personal weakness. It is probable that no man, in that age of moral decline, could cultivate every intellectual faculty to the utmost without betraying some pitiable vanity and overweening self-confidence. Not in the arts of government only, but in letters, in science, in taste, he would allow of no superior. He put to silence the grammarian Favorinus, who found it prudent, as he said, to desist from arguing "with the master of thirty legions." It is asserted that he put to death the architect Apollodorus, through jealousy of his professional accomplishments. In his latter years he became more than ever impatient of contradiction, and the fretfulness of his temper, which degenerated at last into gloominess and cruelty, was aggravated by painful infirmities. Towards the end of his reign he adopted L. Verus, with no other merit than that of being the handsomest of the Roman nobles; but this intended successor fortunately died before him, and on his death-bed he made the more auspicious choice of T. Aurelius Antoninus, a man of the highest promise, which promise he amply fulfilled. Hadrian died, worn out by bodily sufferings, in the year 891 (A.D. 138), at the age of sixty-three, after a reign of twenty-one years, having unfortunately lived long enough to cloud with indelible stains the career of the wisest of the Roman emperors.

Defects of Hadrian's character.

Death of Hadrian, A.D. 138.

SECT. XLIX.—REIGNS OF ANTONINUS PIUS AND M. AURELIUS (A.D. 138–180).

Before his death Hadrian had raised the mausoleum in which he wished his ashes to repose; and the remains of this immense work still existing constitute one of the most striking monuments of antiquity at Rome. But his reputation he was obliged to leave in the hands of jealous survivors, and the Senate would have vented its spite on his memory by refusing him the honours of an apotheosis, had not his successor interfered, and exerted all his influence to gain him the coveted distinction. Antoninus earned, it is said, the title of "Pius" by the affection he thus displayed towards his adoptive father. The character of this prince was truly amiable; and the strict though generous discipline of his immediate predecessors had fortunately so calmed the temper of the Roman people, and suppressed all irregular ambitions, that the heir of their power was enabled to carry on the government on the principles of magnanimous moderation which naturally belonged to him. During the three-and-twenty years of Antoninus's reign we read of no intestine dissensions; nor was even the peace of the frontiers disturbed by foreign aggressions. Hadrian is accused of being the first to sanction the fatal policy of bribing the barbarians. How far he is justly amenable to the charge we do not positively know. He certainly did not adopt any such plan generally, and exceptional occasions there may have been on which it was not

¹ Some modern writers affirm that not the rampart only, but the wall which runs mostly parallel to it a few paces to the north, was the work of this emperor. The wall has more commonly been ascribed to Severus. The Roman authorities are vacillating and inconsistent. Gildas and Bede ascribe the wall to the latest period of Roman dominion in Britain. Amidst this uncertainty, it may be sufficient to remark that the rampart, running along the southern slope of the hills, must have been constructed for shelter rather than for defence; the wall, which follows the summit of the ridge, indicates a time when defence was paramount to every other consideration.

Political
History.

unwise to employ it. However this may be, we find that the peace of the empire was now substantially secured for more than a quarter of a century. Antoninus, indeed, saw reason to depart from Hadrian's cautious policy in Britain, where his lieutenant, Lollius Urbicus, advanced again to the boundary-line of Agricola. He departed from it also in another particular, in which we may take a greater interest, by repressing the persecutions which had so long raged against the Christians. On the whole, however, there is no period of equal length in the Roman annals of which we know so few particulars as this. This is owing partly, no doubt, to the uneventful character of the times, and partly also to the tameness of the Roman people themselves, who seem to have produced no men of prominence in public life during this reign. Even in arts and literature the spirit of Rome seems to have been quiescent; but Greece witnessed a great revival in letters, and was distinguished by a flourishing school, if not of original genius, at least of correct and elegant imitation. But the single history of the times which survives is peculiarly meagre, and we must regret the transient glimpse which is allowed us of a reign so full of social if not of political interest.

Death of
Antoninus
Pius,
A.D. 161.M. Aure-
lius, "the
philoso-
pher."

Antoninus Pius evinced his regard for his predecessor by honourably fulfilling the obligation imposed upon him of adopting M. Aurelius, the son of Annius Verus, and his own nephew. For this youth, even in his tender years, Hadrian had shown a great predilection, being struck by his noble character as well as his excellent abilities. He used to call him, not Verus, but Verissimus; and on the death of his associate Ælius Verus, he was only prevented by his extreme youth from nominating him at once as his successor. Aurelius was carefully educated under his uncle, whose daughter Faustina he received in due time in marriage. Acquiring after his adoption his father's name Antoninus, he became distinguished from him in common speech by the further title of "the Philosopher." He devoted himself to the study of the Greek writers on morals, and professed himself a strict disciple of the Stoic school. The memoir he has left, consisting of reflections on his own life and conduct, is considered one of the most interesting relics of antiquity. It presents us at least with a picture drawn from life of a man in high station, and full of public cares, striving ingenuously to square all his actions to the rules of the truest wisdom of the ancients. Austere and pure as the Stoic principles were, they were not, it seems, too high-flown to be practically fulfilled by a man of strong resolution, lofty feeling, and thoroughly in earnest. The noble Roman, imbued with the Grecian philosophy, formed the fairest combination of moral excellences of which heathen antiquity was capable. Aurelius succeeded Antoninus in the year 914 (A.D. 161), and following again the arrangement prescribed so long before by Hadrian, associated with himself Lucius Verus, a son of Hadrian's favourite. This man was indeed of a very different character from himself; but while Aurelius, whose health was not strong, inclined to a quiet career of business and study at home, he might expect to find in his colleague, who was a man of great vigour of body, without any tincture of letters, an able assistant in the affairs of the camp. Immediately on the death of Antoninus the Parthians threatened the empire with war, and Verus was dispatched to take the field against them. But neither did Aurelius contemplate a life of tranquil retirement. The Chatti, a German people on the Mayn, were assuming an attitude of defiance; and an insurrection was at the same time apprehended in Britain. The defence of the West was undertaken by the Philosopher in person.

Verus as-
sociated in
the empire.Victories
in the
East.

While the vigilance of Aurelius kept the Germans and Britons in check, the lieutenants of Verus, rather than Verus himself, who indulged without stint or shame in the licentious voluptuousness of his Syrian head-quarters, in-

flicted a severe defeat on the arrogant Parthians. The successes of the eastern war were celebrated by the two emperors in a splendid triumph, and commemorated in the sounding titles they appended to their names. But in the midst of these rejoicings a double calamity was impending over the empire: a combination of hostile tribes along the northern bank of the Danube, known by the terrible names of the Marcomanni, the Quadi, the Alani, and the Sarmatæ, was preparing to pour over the frontier and overwhelm the Pannonian and Illyrian provinces; at the same time the seeds of a fatal pestilence had been imported by the soldiers of Verus from the East, and become disseminated among the mass of the population almost throughout the Roman dominions. The alarm and distress of the people were aggravated by the inclemency of the seasons. The city was visited by one of the fearful inundations, periodically recurring, against which no adequate precautions had been taken through so many centuries, which swept away the magazines of corn by the river's side, and cut off the supplies of the turbulent multitude. The two emperors went forth together to combat the enemy on the frontier, and returned after a temporary success. Again they were summoned to the rescue, and this time Verus died on his march. The prevalence of the plague rendered recruiting slow and difficult; and Aurelius, determined to spare no effort in the defence of his country, did not scruple to enrol slaves and gladiators in his legion, a resource which had never been adopted but in the greatest extremity. At the same time he made what was to him a much less sacrifice, by selling the vast stores of jewels and furniture amassed by a succession of princes in the imperial palaces. The victory of Aurelius over the Quadi, in 927 (A.D. 174), is rendered memorable by the claim advanced by the Christians to a miraculous interposition. The affairs of the Romans were retrieved, it seems, by the occurrence of a seasonable storm; a fact which is commemorated on the column erected by the emperor in Rome. Some fathers of the church maintained, at a later period, that the rain was sent in answer to the prayers of a legion of Christian soldiers, to which the name of *Fulminatrix* ("the thundering") was in consequence given. They added that Aurelius suspended the persecution of the believers in consequence of this manifest sign of the Divine favour towards them. It has been proved, however, that the name of *Fulminatrix* was of earlier origin; and modern Christian divines will not allow that there was any suspension of persecution during the reign of the philosophic emperor. The story, we must suppose, was embellished, perhaps unconsciously, by the fervid imagination of Tertullian.

Political
History.Great
plague and
other dis-
asters.The "Thun-
dering Le-
gion."

But before he had broken the power of the Danubian tribes, Aurelius was called away to confront a more pressing danger in the East. The Empress Faustina, the daughter of the good Antoninus, inherited, it seems, none of her father's virtues. The dissoluteness of her conduct is said to have been notorious at Rome, and her husband, who loved her tenderly, was alone blinded to it. A crime of still deeper dye is imputed to her by the historians. Apprehensive of the risks the emperor ran from the infirmity of his health, as well as from the chances of distant warfare, and trembling for the succession, in case of his sudden death, of her young son Commodus, she intrigued, we are assured, with Avidius Cassius, the commander in Syria, offering him her hand in the event of her husband's demise; an offer which might be considered equivalent to an invitation to accelerate it. While Cassius was deliberating on this proposal, a false rumour of the emperor's death actually reached him. He immediately started up as a candidate for the empire, and his soldiers were not indisposed to lead him in triumph to Rome. Aurelius, on his part, prepared to meet him in the East; but when the conflict was on the eve of commencing, the usurper was assassinated by one of his

Political
History.

own officers. The conduct of Aurelius, while the event was still uncertain, seems to have been truly noble. He declared that he only wished to have an opportunity of pardoning his inconsiderate rival; and it is much to be lamented that the history of Rome should have been deprived of so rare an instance of imperial clemency.

Attacks of
the bar-
barians.

Aurelius set the affairs of the East in order, still retaining his generous confidence in the guilty Faustina, who accompanied him on his progress, but who died by her own hand, as some affirmed, in the course of it. He visited Egypt and Athens, and celebrated a triumph at Rome in the year 929. After six months' respite, he was dragged away again to the Danube, where he continued to conduct operations against the restless barbarians for two more years. His self-devotion was crowned with repeated successes, but he was still unable to make a decisive impression on the wide-spread combination of Germans and Sarmatians. Vexed by the cruel destiny which retained him so long in the camp, but lamenting still more deeply the manifest weakness of the empire, which his arm only could uphold, he sank at last, from fatigue and chagrin, in the year 933 (A.D. 180), the fifty-ninth of his age, and the twentieth of his reign. His career, though calamitous, had been glorious. He had attained the fame which he never coveted, of a warrior; but he has earned still greater fame, and such as he would doubtless have more dearly prized, as a patriot and a philosopher. He seems to have lived up to his professions, and those professions the highest perhaps that a heathen could make, more fully than any heathen and almost any Christian moralist. No character, at least in ancient history, deserves to be held in higher honour by the wise and good of all ages. In his virtues, in his sufferings, in his triumphs and his reverses, he ran very nearly the same course as our English Alfred; but Alfred has been appreciated more and more by the advancing goodness and wisdom of his countrymen, Aurelius, in the now rapid decline of the empire, found no Roman imitators and few admirers.

Death of
V. Aure-
lius,
A.D. 180.

SECT. L.—REIGNS OF COMMODUS AND PERTINAX.

Commodus,
the un-
worthy son
of M. Aure-
lius.

If the good and wise Aurelius betrayed some weakness of character in suffering himself to be blinded to his wife's infidelities, he erred more seriously in allowing the succession to his empire to devolve on a son so unworthy as Commodus. This youth seems to have possessed none of his father's virtues, nor had the training in wisdom which we must suppose his father to have given him produced any fruit. Though eminently handsome in person and skilful in his martial exercises, he was coarse and brutal in manners, cruel and cowardly in disposition. Admirably as the empire had been governed from the time of Nerva, and, with the exception of Domitian's reign, from the time of Vespasian, a period of more than a hundred years, it now became evident that the happiness of the Roman world depended on the general good qualities of the sovereign, and not on the stability of the principles on which the administration was founded. Vespasian had restored the dignity of the Senate, and the improvement he introduced in the manners of the nobility had contributed to strengthen its position in public opinion. Succeeding emperors, with one base exception, had condescended to lean upon the authority of this illustrious body, to consult it in the conduct of affairs, to defer to it in cases of adoption or association in their supreme power. The Senate, on the other hand, had had the good sense and modesty to accept the part assigned it without presuming further: it had responded to the emperor's appeals, but had refrained from dictation and perhaps even from suggestion. It is undoubtedly one of the most remarkable incidents in history, that two co-ordinate powers, so unequally matched in real force, should have continued to maintain for so long a period the tacit understand-

VOL. XIX.

Political
History.

ing which secured the peace and happiness of mankind. The machine had hitherto moved so easily that no one perhaps at Rome was aware, at the moment of Aurelius's death, how precarious were the ties which actually held it together. Aurelius himself was unable to anticipate the certain disruption which must ensue from the collision of a rude and selfish prince with a proud but impotent nobility.

The detestation which the new emperor incurred may throw some suspicion perhaps on the details transmitted to us of his cruelties and other enormities, in which he is said to have equalled the jealousy of Domitian, the caprice of Nero, and the extravagance of Caius. But with these loathsome particulars we need not much concern ourselves. The peace which, immediately on his father's death, he made with the Marcomanni was undoubtedly premature; it is not necessary to inquire whether, as asserted, it was purchased with money. After his departure for Rome the frontiers were more than once assailed by the barbarians, but successfully defended by the captains trained under the brave Aurelius. Commodus commenced at once a career of profusion and dissipation, showing too plainly the weakness of character which an untoward accident soon exasperated into fury. The jealousy of a sister towards his wife seems to have been the cause of the first conspiracy against him, which only failed from the hasty exclamation of the assassin, "The Senate sends you this!" Commodus had time to parry the blow. His life was saved, the conspirators punished; but his suspicions had been awakened, and from this time he could never rest while he saw before him the wise and able men whom his father had introduced into the highest places of the state. All his moments were now divided between extravagant amusements on the one hand, and sanguinary precautions for his own safety on the other. His sensuality was as brutal as that of the worst of his predecessors; his prodigality in shows and entertainments as excessive: he exhibited his skill in shooting the beasts in the circus; but the Roman spirit, even in this stage of its decline, was outraged by his assuming the name and attributes of Hercules, and requiring (the first of the Roman emperors) that divine honours should be paid him while still living. He commanded that not one only, as Julius, Augustus, and others, but all the twelve months should be named after his own titles, and that the city and empire itself should be designated, not as Roman, but *Commodian*. All power he threw into the hands of a favourite named Perennis; but this man was eventually murdered by the prætorians. Disgusted and incensed as the senators were at the outrages of all kinds committed by this abominable tyrant, they were utterly incapable of concerting any plan for overthrowing him. They neither raised the people against him, nor won over his guards, nor invited the commanders of the legions to draw the sword in their behalf; they had not even confidence enough in one another to plot his assassination. He fell at last, after a career of twelve years, by an intrigue of the palace. The contriver of his death was his own concubine Marcia, who discovered, it was said, her own name on the list of the victims he was about to massacre.

Death of
Commodus,
A.D. 192.

The Senate, it seems, was not privy to the murder, and had made no preparations to profit by it. Lætus, the prefect of the guards, and Eclectus, chamberlain of the palace, agreed to present Publius Helvius Pertinax, an officer of obscure family, but of distinguished ability, to the prætorians, and by the promise of a liberal donative their support was purchased. The Senate, to whom Pertinax next exhibited himself, accepted the nomination with joy, and declared that he was the emperor of their own choice. Probably the empire could have furnished no worthier successor to Trajan than this brave and virtuous veteran, and the nobles of Rome might be proud of the respect and deference he manifested towards them. It seemed as if, after

Murdered by the prætorians.

The so-called "happiest period of the human race."

a momentary eclipse, the principles of government consecrated by so many virtuous rulers, from Vespasian to Aurelius, were about to shine out again. But it was too late. The interregnum of Commodus had lasted too long. The interval of licentiousness in the court had corrupted the discipline of the camp. The prætorians, thoroughly debauched by the indulgence of the late tyrant, disdained the restrictions placed upon them by their new master. An attempt at reform and repression resulted in a military insurrection, in which Pertinax lost his life, after a brief reign of only three months. Though the real power of the Senate had long passed away, it had still retained up to this fatal epoch a shadow of authority, and we have seen how throughout the Flavian and Antonine period all the good emperors, all, that is, but two of the series, had lent their countenance to its pretensions. Though ruling by the sword themselves, they had kept the sword carefully under the gown, or suspended it from the palace wall. This moderation had been well rewarded. The good emperors of Rome had reigned long and prosperously. The honours they had bestowed on the Senate had been repaid them by the Senate, the people, and, so at least the Romans might believe, by the gods of Rome also. This period has often been distinguished with the title of "the happiest era of the human race." It is difficult indeed to point to any period, at least of ancient history, in which so large a portion of mankind enjoyed peace so nearly unbroken, wealth so widely diffused, laws so generally equitable, manners so polished, the appliances of art and science so numerous and so accessible. Yet we cannot commit ourselves to so bold a panegyric on an age in which morality was so lax, religion so effete, public spirit so nearly extinct. Even amidst unclouded material prosperity such deficiencies as these must have left a canker in millions of hearts, and poisoned, though unseen, the actual enjoyment of life. Indications, however, are not wanting that even the material prosperity of the Romans was undergoing through this period a slow but steady decline. Population was stationary or decreasing; production was suffering with the decay of industry and the vital forces of the state. When a nation has arrived at this turning-point in its career an external shock from war or pestilence may give it a blow from which it cannot recover. At a healthier and stronger period the onslaughts of the barbarians on the frontiers, and the ravages of the plague within, would have been cheerfully encountered and rapidly repaired. But stricken as she was at heart, Rome could now recover from neither. The barbarians ever continued to prey on her vitals through the remainder of her feeble career, and the great plague of Aurelius swept away resources which she had no longer strength to replace.

SECT. LI.—REIGNS OF JULIANUS AND SEVERUS (A.D. 193–211).

Didius Julianus.

From this epoch all the interest of Roman history, as the record of a political organization, must cease. We enter upon a period of an hundred years, during which the government remains an undisguised military usurpation, extorted and retained by the drawn sword. On the death of Pertinax the Senate lost all hope. The men of the gown cowered in silent despair; while the prætorians proclaimed aloud that they would offer the empire to the men of their choice, and allowed, it is said, more than one competitor to bid for their suffrages with largesses. Didius Julianus, a wealthy but incapable senator, promised most, and was accordingly accepted. He commenced his reign at Rome with the acquiescence of the civil power, but under the protection of the guards; but the legions were not content with leaving such lucrative patronage in the hands of a few favoured cohorts, and as soon as the accession of their nominee was known in the camps abroad, the

army of Illyricum proclaimed their own general, Septimius Severus; that of Syria, Percennius Niger; and that of Britain, Clodius Albinus. Of these, Severus was the nearest to Rome, and he was perhaps the most active and energetic of all the competitors. He marched without delay upon the capital, and the Senate hastened to anticipate his reprisals by decreeing the death of Julianus. The puppet of the prætorians was deserted by his mercenary patrons, and suffered without an attempt at defending himself. Severus had conquered Rome, and this fact he made no affectation of disguising. Supported by the army, he disarmed and broke up the prætorian cohorts; he punished also the murderers of Pertinax; but he did not pretend to rule by any other means but force, and he immediately replaced the old guards of the city with more numerous battalions of legionaries. Having thus fortified his position in the city, he prepared to encounter the rivals arming against him in the provinces. It was easy to deceive the voluptuary Albinus with overtures for a division of the empire; but Niger was a man of spirit and ability, and required to be met boldly in the field. The shock of battle took place near the Gulf of Issus in Cilicia in the year A.D. 174, and ended in the defeat of the Syrian pretender. Niger was soon afterwards slain, and Severus exercised remorseless and Albinus vengeance on his adherents. From thence he turned his steps westward, first attempting to effect the death of Albinus by assassination, but when that failed, leading his victorious troops to encounter him in Gaul. Against a man so vigorous and resolute the British commander had no chance of success; but the hopes of donatives and plunder still animated his men, and they ventured to contend with the forces of the emperor near Lyons. Albinus was completely routed, and fell on his own sword. Severus again followed up his victory with a bloody vengeance. But though relieved from all his rivals, and secured against the renewal of domestic hostilities, the conqueror was not permitted to rest for a moment. The overthrow of the Syrian army had laid bare the frontier of the Euphrates, and the Parthians invaded the undefended province. Severus hastened to confront the foreign foe with unabated alacrity, and the exploits of his legions in the East, under his able guidance, might be likened to those of Trajan, the greatest commander of the empire.

Political History.

Death of Julianus.

Victories of Severus over Niger and Albinus.

The reign of Severus was in fact a series of marches from one end of the empire to the other. His sojourns in Rome were few and transient, but his conduct when there was marked with the arrogance and harshness of a mere soldier. The nobles, whom he insulted and harassed, hailed his departure with satisfaction. Old and infirm, he determined at last to visit Britain in person, and complete the subjection of the Caledonians, by whose inroads the province was repeatedly afflicted. He recovered the territory south of the Clyde and Forth, and penetrated some way into the Highlands. The Roman stations, which may still be traced as far north as the Moray Firth, are due perhaps to the energy with which he pushed his successes. But he was now suffering from gout; his constitution was broken by excessive fatigues; and while his conquests were yet uncompleted, he retired to Eboracum (York) to die. His last watchword, given on his death-bed, *Laboremus* ("we must be doing"), marks the character of this indefatigable warrior, whose whole idea of political government was unceasing movement and action.

Death of Severus.

SECT. LII.—THE SUCCESSORS OF THE FAMILY OF SEVERUS (A.D. 211–235).

Severus left his inheritance in partnership between his sons Bassianus, vulgarly called "Caracalla," and Geta. The elder proved him a monster of tyranny, of the coarse type of Caius and Commodus; the younger hardly promised

Political History.

Caracalla.

better ; but he was early cut off, being stabbed by his own brother in his mother's arms, before he had fully developed his evil qualities. Of the other crimes of Caracalla, his dissoluteness and ferocity, there is no occasion to say more ; they will be too easily understood from the examples already presented to us. Timid as well as ferocious, he too was assassinated by Macrinus, the prefect of his own guards, after a bloody reign of six years. The Roman world was already weary of him. The vast edifice which he had constructed for the pleasures of the people bore the title of *Thermæ Antoninianæ*, for down to Caracalla the successors of the first Antoninus had all assumed his venerated name in conjunction with that of Augustus ; but this once-cherished appellation was now rendered odious to the Romans, and was henceforth dropped from the imperial appellations. Yet, notwithstanding his personal excesses, the reign of Caracalla deserves to be noticed as an epoch in Roman jurisprudence. The administration of the wise and learned Papinian extended over the latter years of Severus, and commencement of the following reign, and was distinguished by the application of just principles of law and government. That great jurist himself fell a victim to his young master's jealousy ; but to him may probably be ascribed the grand and comprehensive measure by which the boon of citizenship, the cause of so many contests in earlier times, was finally extended to the whole mass of the free population throughout the empire. It is true that this concession was no longer regarded as a favour. It conferred no privilege or exemption, as in days of yore ; on the contrary, it brought all the subjects of the emperor within the scope of the direct tax on successions, which had been imposed by Augustus on the citizens of Rome only. But the effect of this great measure was to obliterate henceforth all distinctions of descent and race, and complete the fusion into a single nation of a hundred millions of civilized men.¹

Extension of citizenship throughout the empire.

Macrinus, A.D. 217.

The deed of blood had been accomplished on the borders of Syria, where the emperor was engaged in leading an expedition against the Parthians. Severus had enjoined his son to pay court to the soldiers, and despise all other classes of his subjects ; and the army, which was attached to him, would not have conferred his power on Macrinus had it been aware that the assassination had been committed at that chief's instigation. Macrinus, however, as the ablest of its officers, was now chosen for the command ; and the distant Senate was informed, probably with no punctilious phrases, that a new ruler had succeeded to the throne of the Cæsars. The Senate would have offered no resistance ; but in fact it had not time to resist. The news of the election could hardly have reached Rome when Macrinus himself fell by a revolt of the province in favour of a cousin of Caracalla, a Syrian by birth, Elagabalus, priest of the Sun at Emesa, who bore himself the name of the divinity he was appointed to serve. It was time that all the nations of the empire should coalesce into one when their rulers were thus repeatedly chosen from the provinces. Trajan and Aurelius had been Spaniards, Antoninus a Gaul, Severus an African. But these men were great themselves, and the nations to which they belonged deserved to be respected by the Romans. Elagabalus was a miserable stripling, without virtue or talent ; and the Syrians, as a people, were despised for their effeminacy and profligacy. The claim of affinity with Severus was the sole recommenda-

Elagabalus, A.D. 218.

tion this unworthy creature possessed ; but his grandmother Mœsa was a clever intriguer, and played on the affections of the soldiery, who eagerly embraced his cause. They quickly overthrew the upstart Macrinus, who perished with his son and associate Diadumenianus. Macrinus had already purchased peace from Parthia. The soldiers carried their new emperor to Rome, where he speedily immersed himself in the vilest and most disgusting debauchery. The majesty of the purple, often as it had been sullied by stains of every kind, was never perhaps so utterly prostituted and degraded as by the nameless enormities of Elagabalus. For four years the prætorians endured him ; then even their patience was exhausted, and they rose and slew him ignominiously.

Political History.

The empire was now offered to another scion of the stock which claimed connection with Severus. Mœsa, the sister of that emperor's consort, had had two daughters. Soemias, the elder, was the mother of Elagabalus ; the younger, Mammæa, had borne Alexander Severus, whose character throws one bright though transient gleam over this gloomy period. Under the prudent training of his mother, this prince had unfolded both virtues and abilities ; and he continued to profit on the throne by the lessons he still permitted her to instil into him. With the aid of Ulpian and other illustrious jurists, he carried on the great work of Roman legislation ; the sole but sufficient token which enables us to augur that, amidst the depravity of its rulers and the violence of its soldiers, the empire was still the cherished home of private graces and tranquil enjoyments. The rescripts of Alexander himself, and the digests of his ministers, are more significant monuments of the civilization of the age than the baths, the columns, and the palaces which continued to be raised to the vanity of princes, or for the gratification of the populace. The reign of this gallant emperor was prosperous both in peace and war, but he too was required to buckle on his armour for a contest in the East. The revolution, indeed, by which the dynasty of the Parthian Arsaces was overthrown, and the Sassanidæ, a native race, succeeded to power at Seleucia, was an augury of evil days to come. The great Eastern Empire, henceforth no longer Parthian, but Persian once more, as of old, sprang up in renewed vigour, and inflicted, under succeeding rulers, many terrible blows on Rome.

Alexander Severus, A.D. 222.

The last of the Alexanders gained, however, a great victory over the foes of his illustrious namesake, and returned to celebrate a triumph in the Capitol. Scarcely had he enjoyed the reward of his bravery, when he was summoned to repel another attack of the Germans on the Rhine, and the necessary enforcement of discipline caused a mutiny among the enervated legions on that long peaceful frontier, in which he unfortunately lost his life. His reign had lasted thirteen years, and for that brief space his prudence and vigour had arrested the decline, now too clearly apparent, of the empire. It had now become abundantly manifest that it was by the soldiers alone that an emperor could be made, and that the soldiers themselves could not long endure the creatures of their own making. The long list of military princes who now follow in rapid succession presents us with one or two names only that command the slightest respect ; while the events of our history become as uninteresting as the characters of the chief actors in them. A rapid glance will suffice for the period of half a

Revolution in Parthia.

Death of Alexander.

¹ By this number we intend to specify approximatively the whole population of the empire. Of course it will be understood that the slaves, included properly in the total of the population, are excluded from citizenship. Of the numbers of this class it is impossible to form any calculation. The guess of Gibbon and others, that the slaves were as numerous as the freemen throughout the empire, is wholly gratuitous, and appears to us extremely wide of the mark. In the great cities, in Italy, and in some special districts, they were undoubtedly numerous, though nowhere, we conceive, did they approach at all near to this proportion. But throughout the greater part of the provinces they must have formed but a small section of the population. In this respect the condition of modern Turkey presents perhaps the nearest analogy we can discover with the Roman empire in the third century ; and our statisticians have not generally thought it worth while, in enumerating the elements of population in Turkey, to take any account of the slaves at all. Possibly the slaves in Rome might be one-third, those in Italy one-fifth, those in the provinces generally one-tenth or even one-twentieth of the whole numbers.

Political History. century, from the death of Alexander in 235, to the accession of Diocletian in 284.

LIII.—ATTEMPTS OF THE SENATE TO RECOVER AUTHORITY.

Such is the variety of names which now rapidly succeed one another at the head of the Roman world, that it will be well to divide the period on which we now enter into two parts, according to the leading features which distinguish it. The first comprises the attempts of the Senate to resume its sovereignty over the empire; the second signalizes the efforts of the generals, when these attempts have completely failed, to secure the permanence of military supremacy by restoring the discipline and subordination of the soldiers. The elevation of the Thracian peasant caused an unwonted shock to the susceptibilities of the Roman nobles; and if their disgust was enhanced by the report of his severities and barbarous violence, they were encouraged to make head against him by his continued absence from Italy, which, during his short career of undisputed power, he did not even deign to visit. It was not from the Senate, however, or in Italy, that the movement against Maximin arose. While he was occupied with military operations on the northern frontiers, the chief inhabitants of Africa raised an aged noble named Gordianus to the purple, in which they associated with him his son, and invoked the Senate of Rome to accept him as their leader against the emperor of the army. The Senate acquiesced; denounced Maximin as a usurper, and called on all the provinces to rise against him. The summons was not ineffectual. Maximin found himself deserted both by provinces and armies. But a fresh insurrection in Africa cut off both his rivals; and when he led his troops into Italy, and besieged Aquileia, he found himself opposed, not by the Gordians, but by Maximus and Balbinus, whom the Senate hastily elected in their place. Maximin fell in a camp mutiny; Maximus and Balbinus were slain soon afterwards in a military insurrection; but a third Gordian, a mere stripling, had been already associated with them, out of respect for the great virtues of the grandfather, and the soldiers suffered this nominee of the Senate to retain possession of the purple. The third Gordian was amiable, but probably weak in disposition. The reins of power were held for him with a strong hand by his prefect Misitheus; and the government was conducted, while this man lived, with credit and success. The formidable attitude of the Persians called the emperor to the Syrian frontier. Misitheus was cut off by the intrigues of Julius Philippus; and when this man succeeded to the post of prefect, the emperor fell helplessly into his power, and was soon sacrificed to his ambition. Philip, who now seized the empire, was a native of Bostra. He is generally called "the Arab," but it is not necessary to suppose that he was of Arabian extraction. At all events, he was received without a murmur by the Senate, whose feelings were gratified, no doubt, by the celebration of the Secular games, which he instituted in 248, on the thousandth anniversary, for so it was reckoned, of the foundations. The government of this emperor was mild and prudent. Some Christian writers have claimed him for a convert. If the evidence for the fact is slender, the arguments against it may be dismissed as nugatory; but the Christians, it may be enough to remark, were disposed to speak favourably of the victim of a man who was notorious as one of their fiercest persecutors. Philip fell in a military insurrection, and was succeeded by Trajanus Decius, an excellent officer, and a man of genuine Roman descent. Thus recommended to both the soldiers and the Senate, he confirmed the predilection of the first by the bravery with which he made head against the attacks, now renewed year by year, of the Goths and Sarmatians in the north; and of the latter, by the sweeping attack he made

against the long-hated sect of the Christians, of whom we have for some time lost sight in our history.

The Christians, harmless as they were both socially and politically, had been objects of popular hatred from the time when they were first confounded in the common apprehension with the turbulent and rebellious Jews. They had fallen under the suspicions of emperors and prefects, and had often been required to make proof of their loyalty by performing acts of heathen sacrifice, or swearing by the imperial name; and the firmness with which, on such occasions, they had maintained their religious principles had consigned them too often to tortures and death. More than once the anger and alarm of the civil authorities had prompted still further inquisition into the tenets of the new sect, and from single and occasional cases of violence the persecution had extended to congregations and communities. It is probable, however, that the persecution was first general under Decius; and we may believe that to the vigorous and systematic effort this emperor made for the suppression of the true faith he was prompted not only by his wish to conciliate the nobles at Rome, but by a long-growing persuasion that the evils which afflicted the empire might be traced to the alleged impiety of these reputed fanatics. The recent celebration of the secular games had given a stimulus to Roman superstition; and this now wreaked itself, without stint or scruple, on the unresisting victims, whose marked indisposition to enroll themselves in the military service of the state rendered them doubly objects of suspicion in the general panic which prevailed throughout the empire. For this panic, indeed, there were sufficient grounds, both within and without. The northern nations, then known under the names of the Quadi and Marcomanni, had been controlled by M. Aurelius, and had remained generally quiescent during the seventy years which had followed; but now the Franks, the Goths, and the Alemanni were pouring in ever-increasing numbers across the Rhine and Danube: the inundation, long pent up, had gathered force and volume, and threatened to overflow the whole empire. The resources of the government, first shaken by the long-protracted pestilence of the Antonine period, had never been restored. The population and wealth of Italy and the provinces continued gradually to decline; but if these distant symptoms of decay were yet hardly visible except to statesmen, the plagues which swept the great cities of the empire in succession, between the years 250 and 265, alarmed men of every class with the prospect of its impending dissolution.

SECT. LIV.—THE EMPERORS OF THE CAMPS (A.D. 251–284).

There was no hope for Rome in the favour of its gods nor in the virtues of its people; but there was still hope in the personal bravery of its captains; and from this time we find, with only one or two interruptions, a remarkable succession of able chiefs at the head of its affairs. Decius fell in battle against the Goths. The legions, satisfied with the late appointments, left the choice of his successor to the Senate, and Gallus purchased a respite from attack by the payment of tribute to the barbarians. This disgrace was soon wiped out in his blood. Valerian, a favourite officer of Decius, reigned in his stead. The Franks and Alemanni were checked in the West; but in the East the Goths made an irruption into Greece and Asia Minor, crossing the Black Sea, and traversing the Hellespont, and were stopped rather by the effects of luxury and climate than by the sword of a defender. When these swarms were cleared away from the fertile lands they had desolated, Valerian had a harder task to perform in hurling back the Persians from Syria. Defeated and taken by Sapor, he was condemned to chains and menial offices, while his son Gallienus, a dissolute youth, refused to arm for his recovery.

The advance of the Persians was checked, not by the emperor and the legions of Rome, but by the brave Odenathus, and the still braver Zenobia his wife, the rulers of the tributary kingdom of Palmyra. Elated by his success, and vain of the splendour of his capital in the desert, Odenathus was not content with aspiring to independence, but claimed, it is said, to be associated with Gallienus in the government of the empire. But pretenders to the purple sprung up now in various quarters. The attacks of the barbarians called forth the legions on every frontier into the field, and whenever a victory was gained, or an imposing front assumed by the defenders of the state, there a new emperor was proclaimed, and the submission of the Senate and people demanded. To this host of competitors, most of whom fell quickly by one another's hands, the name of the "thirty tyrants" was popularly given. Their real number was little less than twenty. One of the most successful of them, Aureolus, penetrated into Italy, and Gallienus fell in a tardy attempt to assert his power and dignity against him.

But the usurper was shut up in Milan, and the death of Gallienus served only to raise up a stronger antagonist in the person of M. Aurelius Claudius, whom the Italian forces appointed their commander. Claudius was a man of high military virtue. He destroyed Aureolus, overcame the Germans, and totally routed the Goths in the great battle of Nissa, from which he derived the title of "Gothicus." But this brave chief was speedily cut off by sickness on his route to the East. Claudius breathed his last at Sirmium on the Danube, and it was at Sirmium that Aurelian, his illustrious successor, had been born. This man, the son of an Illyrian peasant, was one of the greatest, as he was almost the last, of the heroes of the Roman legions. He was intelligent as well as brave; and after defeating a fresh attack of the Goths, he recognised the policy of withdrawing the outposts of the empire from beyond the Danube, and finally renounced the conquests of Trajan in Dacia, which seem to have been re-occupied after the time of Hadrian. A still more urgent necessity compelled him to admit into his pay large bodies of these formidable enemies, which, for a time at least, added fresh vigour to the Roman arms. Aurelian led his forces against the Queen of Palmyra, Odenathus being now dead. Though gallantly resisted, he overcame his presumptuous rival, and exhibited Zenobia in his triumph at Rome. He continued to rule with vigour and discretion; but the barbaric inundation was still swelling on the frontiers, and at last a body of Alemanni burst into Italy, and advanced for a moment within the confines of Umbria. At this crisis the safety of the city itself seemed in question. Aurelian condescended to secure it by tracing the ample lines of fortification which now for the first time encompassed the capital of Augustus and Trajan. But the legions, under a chief like Aurelian, formed still a stronger rampart than brick or stone. The Alemanni were speedily repulsed. Aurelian was summoned soon afterwards into the East; but while leading an expedition against the Persians he was assassinated in his tent, at the instigation of his secretary Mnestheus. The soldiers lamented his loss, and avenged it with the blood of the assassins. They paid a higher tribute of respect to his memory by awaiting six months the election of his successor by the Senate. When that body placed the victorious but aged Tacitus at their head, they cheerfully acquiesced in the well-meant but imprudent choice. Tacitus led his troops manfully against the Scythian Alani. He was victorious in battle; but the fatigues of the campaign were too much for his enfeebled powers, and he died of exhaustion in the course of a few months.

The army now chose their own leader, and they also chose well. Aurelius Probus was accepted by the Senate, and Florianus, the brother of Tacitus, who had assumed the purple, without authority either from the one power or the

other, relinquished the contest he had provoked by a voluntary death. Probus, like Aurelian, was a native of Sirmium, and he proved himself worthy of military rule,—the only rule now possible,—by his skill, his bravery, and his hardy virtues. During a short but active reign of six years he defeated the Germans on the Rhine and Danube, and constructed, or rather repaired, the rampart which connected those rivers. He overthrew the Goths; and, passing from the West to the East, led his forces against the Persians. From this enemy he extorted an honourable peace, and then, having put down some competitors for power, employed his legions in draining marshes and planting vineyards. But the discipline he enforced, and the wholesome labours he required, alike disgusted his licentious warriors; and Probus, who never quitted the camp, lost his life in a mutiny.

The head-quarters of the deceased monarch were again the spot on which his successor was to be elected. The choice of the soldiers fell once more on a rude but valiant soldier named Carus, and the Senate once more ratified it without a murmur. These warrior-princes paid no attention to Rome, and the nobles of the city had discovered that if they lost in dignity, they were gainers by their absence in ease and security. The movements of the army, wholly recruited and supplied from the frontier provinces, were regarded with little interest by the voluptuaries of the capital. These unworthy Romans were content to leave the task of defending the empire to men who claimed from them only a few empty titles in token of their submission. Carus, associating with himself his sons Carinus and Numerianus, gained some fresh victories over the Goths. Leaving Carinus in the West, he again confronted and overthrew the Persians. He advanced as far as Ctesiphon on the Tigris, where his career was suddenly arrested by a stroke of lightning, according to the popular account, but more probably by some secret conspiracy. The sons of Carus were unable to retain the diadem of their father: Numerianus was slain by his prefect Aper, though his death was speedily avenged by Diocletian. The soldiers in the East immediately proclaimed this man their emperor, regardless of the claims of Carinus, which were supported by the armies in the West. The contending powers met on the plains of Mœsia. Diocletian was worsted in battle; but in the moment of his success Carinus was slain by an officer whose wife he had dishonoured; and thus suddenly deprived of a leader, the victorious legions united with the vanquished in acknowledging the surviving candidate.

SECT. IV.—THE EMPIRE RE-CONSTITUTED BY DIOCLETIAN (A.D. 284–305).

The accession of Diocletian to power marks the last great epoch in the history of the Roman empire. Hitherto, however intrinsically weak, the Senate had found opportunities for putting forth its claims to authority; if it was but rarely allowed to exercise its cherished prerogative of election to the throne, it was still regarded as the legitimate centre of administration, the fountain of law and social order. There was at least no constituted authority to oppose it. The chosen of the legions had been for some time past the commander of an army rather than the sovereign of the state. He had seldom quitted the camp, rarely or never presented himself in the capital; content with the provision for his own pride and power extorted from the provinces in which he quartered himself, he had allowed the ordinary march of government to proceed in its usual routine; the social fabric continued to be upheld in Italy and throughout the provinces by the force impressed upon them by the Antonines. But this was the torpor of decrepitude, not the tranquillity of contentment. The provinces lay at the mercy of the armies of the frontier; and the empire might split asunder at any moment into as many kingdoms as there were armies;

unless the chiefs of the legions felt themselves controlled by the strength or genius of one more eminent than the rest. We have noticed many local revolts, and no doubt many more of the kind were constantly occurring. Gaul, Britain, Africa, or Egypt were more than once the prey of soldiers who aspired to become independent sovereigns; the chief of the strongest camp and largest army, who called himself the emperor, found prompter aid in the daggers of assassins than in the swords of his own legionaries: his opponents were generally struck down by their own unruly followers; and it was by fortune rather than by any controlling principle of cohesion that the frame of the empire was still held together. The danger of disruption was becoming from year to year more imminent, when Diocletian arose to re-establish the organic connection of the parts, and breathe a new life into the heart of the empire.

A jealous edict of Gallienus had forbidden the senators to take service in the army or to quit the limits of Italy. The degradation of that once illustrious order, which was thus made incapable of furnishing a candidate for the empire, was completed by the indolent acquiescence of its members in this disqualifying ordinance. The nobles of Rome relinquished all interest in affairs which they could no longer aspire to conduct. The emperors, on their part, ceased to regard them as a substantive power in the empire; and in constructing the new imperial constitution Diocletian wholly overlooked their existence. Nevertheless it would seem that he was still haunted by the undying tradition of the majesty of Rome itself, and it seemed more fitting to abstain from visiting the city than to take up his residence there without paying due respect to the Senate, which was still enthroned on its seven hills. While he disregarded the possibility of opposition at Rome, he contrived a new check upon the rivalry of his distant lieutenants, by associating three other chiefs with himself, welded together by strict alliances into one imperial family, each of whom should take up his residence in a different quarter of the empire, and combine with all the rest in maintaining their common interest. His first step was to choose a

The Augusti-Diocletian and Maximian, A.D. 286.

single colleague in the person of a brave soldier of obscure origin, an Illyrian peasant like himself, by name Maximian, whom he invested with the title of Augustus, in the year 286. The associated rulers assumed at the same time the epithets of Jovius and Herculus; auspicious names, which made them perhaps popular in the camp. Maximian was deputed to control the legions in Gaul, and to make head against the revolt of Carausius in Britain, while Diocletian opposed the enemies or pretenders who were now rising up in various quarters in the East. His dangers multiplied, and again the powers of the empire were subdivided to meet them. In the year 292 Diocletian created two Cæsars: the one, Galerius, to act subordinately to himself in the East; the other, Constantius Chlorus, to divide the government of the western provinces with Maximian. The Cæsars were bound more closely to the Augusti by receiving their daughters in marriage; but, though they acknowledged each a superior in his own half of the empire, and admitted a certain supremacy of Diocletian over all, yet each enjoyed monarchical sway in his own territories, and each established a court and capital as well as an army and a camp. Diocletian retained the richest and most tranquil portion of the empire, and reigned in Nicomedia (now Asia Minor), Syria, and Egypt; while he entrusted to the Cæsar Galerius, established in Sirmium, the more exposed provinces on the Danube. Maximian occupied Italy, the islands, and Africa, stationing himself however, not in Rome, but at Milan. Constantius was required to defend the Rhenish frontier; and the martial provinces of Gaul, Spain, and Britain were given him to furnish the forces necessary for the maintenance of that important trust. The capital of the western Cæsar was fixed at Trêves. Inspired with

The Cæsars Galerius and Constantius Chlorus, A.D. 292.

a common interest, and controlled by the superior genius of Diocletian himself, all the emperors acted with vigour in their respective provinces. Diocletian recovered Alexandria, and quieted the revolt of Egypt. Maximian routed the unruly hordes of Mauretania, and overthrew a pretender to the purple in that quarter. Constantius discomfited an invading host of Alemanni, and wrested Britain from the hands of Allectus. Galerius brought the legions of Illyricum to the defence of Syria against the Persians, and though once defeated in the plains of Carrhæ, he succeeded eventually in reducing the enemy to submission. Thus victorious in every quarter of the empire, Diocletian celebrated the commencement of the twentieth year of his reign with a triumph at Rome, and again taking leave of the city of the Cæsars, returned to his customary residence at Nicomedia. The illness with which he was attacked on his journey suggested, or more probably fixed, his resolution to divest himself of the purple; and on the 1st of May, A.D. 305, being then fifty-nine years old, he performed the solemn act of abdication on the spot where he had first assumed the empire at the bidding of his soldiers. Strange to say, he did not renounce the object of his ambition alone. On the same day a similar scene was enacted by his colleague Maximian at Milan; but the abdication of Maximian was not a spontaneous sacrifice, but imposed upon him by the influence or authority of his elder and greater colleague. Diocletian had established the principle of patrimonial succession by which the supreme power was to descend. On the abdication of the two Augusti, the Cæsars Constantius and Galerius stepped into their places respectively, while each of them called up another Cæsar to supply the posts thus vacated by themselves. Flavius Severus succeeded to Constantius, Maximinus Daza to Galerius. Having seen the completion of all these arrangements, and congratulated himself on the success of his great political experiments, Diocletian crowned his career of wisdom and moderation by confining himself strictly during the remainder of his life to the tranquil enjoyment of a private station. Retiring to the residence he had built for himself at Salona, he found occupation and amusement in the cultivation of his garden; and the story went, that when his more restless colleague solicited him to resume the honours from which he had disengaged them both, he invited him to see the vegetables he had grown, and learn a lesson of simplicity and contentment.

Political
History.

Abdication of Diocletian, A.D. 305.

The wisdom and moderation of Diocletian's character have been justly praised, and it is with pain that we notice how he forfeited both the one and the other in his sanguinary and obstinate persecution of the Christians. The disciples of the true faith were still increasing in numbers; they were continuing more and more to absorb into their body the intelligence, the activity, and the moral force of the empire. Diocletian cannot have been blind to the impossibility of reviving the spirit of heathenism, or raising up in the strongholds either of superstition or philosophy any moral or intellectual force to combat them. Nor can we suppose that he was actuated by the alarms so prevalent as we have seen fifty or a hundred years earlier, when many of the best, and some no doubt of the wisest of the heathens, really believed that the calamities of the empire were caused by the anger of their gods at the impiety tolerated in its bosom. The era of Diocletian, under the sway of a bold and able ruler, was a period of comparative revival and hopefulness. The worst seemed to be past. A better day had dawned. New objects were in view, new principles of government were coming into operation. The Senate of Rome, the stronghold of old and vain tradition, had ceased to exercise any influence in the government. Diocletian had no need to sacrifice to its prepossessions, or to buy its favour by the concession of a principle. The fury which animated three at least of the emperors (for Constantius alone held aloof from the persecution which now raged through three-quarters of

Persecution of the Christians.

Political
History.

the empire) must be traced to a different source. The object of Diocletian's policy was to establish a uniform system of administration, radiating from each centre of government. During the last century the government of the empire had become completely de-centralized. Each province had provided for itself; each army had drawn its supplies from its own neighbourhood. The authority of the Senate had hardly extended beyond Italy; the power even of the emperor had generally been limited to the territory in the midst of which his army was quartered. Even Decius and Probus, vigorous as they proved themselves in their own camp, might fear to provoke a resistance which they had not leisure to quell, if they tried to enforce their edicts in Gaul or Africa. But when, by the multiplication of sovereigns, the executive authority was extended once more throughout the empire, it became necessary to show that the imperial power was no longer a mere shadow. The laws were to be enforced, uniformity to be restored, every province and every subject to be made to acknowledge the paramount supremacy of the monarch's will. Christianity, however innocent in act, had become in its forms and in its ideas a state within the state. Whatever the government might think of its opinions, it could not fail to see a rival in its organization. Counts and prefects were jealous of metropolitans and bishops; and the claims of the church to admit to, or exclude from, a share in privileges of membership, which had now become connected with the enjoyment of benefices and endowments, might seem to trench upon political prerogatives. Having subdued every external enemy and competitor, Diocletian turned his attention to the domestic foe, for as such he regarded it, which had set up a co-ordinate sovereignty within the limits of his own jurisdiction: he proclaimed internecinal war against the Christian society, the extent of which he perhaps miscalculated, the moral power of which he totally misapprehended; and he committed himself to a struggle in which success was impossible, though he did not live himself to know how completely he was defeated.

SECT. LVI.—WARS OF DIOCLETIAN'S SURVIVORS.

Notwithstanding the ability which Diocletian had displayed in the government of the empire, the distribution he made of power on his abdication marks caprice and weakness, and was speedily followed, as might have been expected, by fresh disturbances. Instead of inviting both the Cæsars to associate with them princes of their own choice, he had allowed his son-in-law and favourite, Galerius, to nominate both the new candidates, and to pass over the claims of Constantine, the son of Constantius, altogether. The Cæsar of the Gaulish provinces was far distant in Britain, and was ill: Galerius expected his death, or ventured to overlook him in his absence; and hoped, by calling creatures of his own to the succession, to secure supreme authority over the whole empire for himself. But the moderation of Constantius, which had made him an object of dislike and jealousy to his unscrupulous colleagues, endeared him to his own subjects as well as to the Christian faction throughout the empire. Great multitudes of the new faith had taken refuge under his sway, and had enjoyed his protection. The legions admired him for his victories over the Alemanni and the Caledonians; and when, at the moment of his death, they proclaimed his son Constantine emperor in their encampment at York, the nomination was received with enthusiasm by the population of the western provinces. Galerius did not venture to oppose this demonstration of feeling. He suffered his new rival to exercise authority in the place of his father, but claimed the right, as the eldest and first of the associated princes, to assign him only the fourth rank among the rulers of the empire, with the subordinate title

Constantine, son of Constantius, appointed Cæsar, A.D. 306.

Political
History.

of Cæsar. Constantine was satisfied for the present, and continued for six years (A.D. 306–312) to confine himself to the administration of the Gaulish prefecture. During this period he carried out his father's policy in every particular. He chastised the barbarians in the north of Britain, and put the Roman possessions in that island in a complete state of defence. He flew to the succour of the garrisons on the Rhine, which, on the death of Constantius, were immediately assailed by fresh incursions of the German tribes; and followed up the great victory of Novio by the most terrible massacres of his captives. At the same time he displayed the utmost moderation and clemency towards his subjects, tolerating and protecting the Christians, and remitting the fiscal burdens of all classes of the community. Though personally indifferent perhaps to all forms of religion, he could not fail to mark how great were the numbers, how active the intelligence, of the Christian society, and to feel the miserable impolicy of alienating them by persecution. His vigorous imagination was at the same time kindled by the claim these sectarians advanced to divine interferences and miraculous powers; it is probable also that the deference which their bishops were willing to pay to him as the temporal ruler, while the pagan hierarchy regarded him with undisguised dislike, affected him favourably from the first towards the outward forms of Christianity. While watching his opportunity for raising himself to the highest place in the empire, Constantine was already perhaps meditating terms of alliance with the greatest spiritual influence of the period.

Meanwhile, the Senate also, the centre of heathenism, exhibited for a moment fresh signs of vitality. Affecting indignation at the claims of its late ruler Maximian being entirely postponed to those of Galerius, it had taken on itself to confer on his son Maxentius the title of Augustus. Maximian himself, defying the remonstrances of the aged Diocletian, issued from his retirement, and re-assumed power, under pretence of lending the weight of his name and experience to the cause of his son. He gave his daughter Fausta in marriage to Constantine, and cemented an alliance between the prefect of Gaul and the claimant of Italy. But no sooner did Maxentius taste of power than he drove his own father out of his dominions; and Constantine suffered his father-in-law to find an asylum in Gaul only on condition of resigning a second time all share in the imperial government. When, on the report of Constantine's death, the restless veteran again assumed the purple, he was attacked, defeated, and put to death without remorse by the Gaulish emperor.

Death of Maximian, A.D. 310

The death of Maximian was followed in 311 by that of Galerius, whose painful sickness was ascribed with grim satisfaction by the Christians to a divine visitation. Four Augusti of equal rank now once more shared the empire; but it was immediately apparent that, without the avowed ascendancy of one, in genius if not in power, the rude edifice of the Cæsardom must inevitably fall in pieces. The genius, indeed, of Constantine soon proved to be pre-eminent; but his ascendancy was admitted by none of his colleagues, and it remained to be seen whether he had the means of establishing it by force. Maxentius in Italy and Africa, and Maximian in Asia and Egypt, ruled in voluptuous indolence, making themselves more and more detested by the provinces which had fallen under their sway. Severus was already dead, and Galerius had survived to replace him in Illyricum by a Dacian peasant named Licinius, recommended to him by his military abilities and his popularity among the soldiers. This man had now at least discretion enough to ally himself with Constantine; he contrived also to leave his new confederate to conduct hostilities against Maxentius alone, while he watched himself from a distance the issue of the contest. Scarcely, indeed, was Galerius dead before the two Augusti of the West rushed into deadly conflict with one another. Constantine crossed the Alps, and gained three successive victo-

ries at Turin, at Verona, and, lastly, at the Milvian bridge, two miles from Rome. Maxentius, routed in this final engagement, was drowned in the Tiber; and Constantine entered Rome towards the end of the year 312, where he was received with acclamations, and was acknowledged as chief of the empire by Italy and Africa, as well as by the provinces of his own prefecture. He had already issued from Milan the famous decree which assured the Christians of his favour and protection; and it was on his march towards Rome, before the battle of the Milvian bridge, that he beheld, according to the historians, the vision of the cross in the heavens, inscribed with the blazing legend—"By this conquer."

Constantine had little sympathy for the name of Rome, or for the Senate which represented it; nevertheless, upon entering the old capital of the Cæsars in triumph, he affected to restore the consideration of that illustrious but decrepit body, while he took measures for preventing Rome from ever again giving laws to the empire, by disbanding the prætorian guards and destroying their fortified camp. With this military institution the imperial power departed finally from Rome, and the seat of empire was henceforth to be established wherever the emperor should choose to take up his own permanent residence. Master of the West, Constantine was not satisfied till he had brought the East also under his sceptre. His rival Licinius equalled him in ambition, but neither in ability nor fortune. During the contest in Italy the prefect of Illyricum had been prosecuting his own views of conquest no less successfully in Asia. He had overthrown Maximin, and seized all the eastern provinces of the empire, confirming his victory by the massacre of all the children of Galerius and Severus, as well as of Maximin himself. So far did he carry his precautions as to insist on the execution of the widow and daughter of Diocletian. Thus triumphant in opposite quarters of the empire, the two competitors were equally prepared for a struggle with one another. In the first contest between them, Constantine wrested Illyricum from Licinius. After an interval of eight years, war was renewed. Licinius was overthrown in the great battle of

Overthrow
of Licinius,
A.D. 323.

Adrianople, in the year 323; but his spirit was still unbroken, and while Constantine was occupied in the siege of Byzantium, he collected a numerous force of raw levies to try his fortune in another field. The battle of Chrysopolis brought the contest to a final decision. Licinius was deprived of his imperial honours, and permitted to retire to Thessalonica, there to pass the remainder of his days in a private station. But Constantine had not magnanimity enough to observe the conditions he had imposed on himself. The deposed emperor was soon afterwards accused of intriguing with foreign powers for his restoration, and the victor did not scruple to secure his own supremacy by putting his last rival to death. The family compact devised by the astute Diocletian resulted, in the second generation, in the re-establishment of an undivided monarchy.

SECT. LVII.—UNION OF THE EMPIRE UNDER CONSTANTINE.

Union of
the empire
under Con-
stantine.

Conscious of his own energy and abilities, and sensible of the inherent weakness of the scheme for dividing the imperial powers devised by his predecessor, Constantine determined to retain in his own hand the sceptre of the united empire, while he contrived a more elaborate scheme for lightening the burden it imposed upon him. The original policy of Augustus, according to which the emperor was regarded as the delegate of the state, and his functions were only those of the various popular magistracies combined together in one person, had become utterly obliterated for at least a century. The specious constitutionalism of the early Cæsars had vanished, but no organized system of despotism had been substituted in its place. The chiefs of the state had been content, as we

have seen, to rule with the sword, and to announce their caprices from the camp. In return, their title had received no sanction in the feelings of their subjects. They had been accepted by the Senate and the people as emperors *de facto*, but no idea of right had clung to their names and titles, no honour had been paid to their families, no respect shown to their memories. The notion of monarchical government had been in a state of transition; the old foundations had perished; it remained for Constantine to replace them with the ideas of hereditary succession, of divine right, and of organized administration, upon which they have subsisted throughout Europe to the present day.

Political
History.

It was only in the oriental courts that the imperial reformer could find the exemplar of government by which to shape his own system. He surrounded his own person with the pomp and ceremony of Asiatic sovereignty, affecting the reserve of a superior being, and allowing access to him only through a crowd of eunuchs, chamberlains, and ministers. The old Roman idea of the essential equality of the emperor and his chief nobles was entirely swept away. A complete separation was made between the civil and military authorities; and again the vital principle of the ancient republic, according to which every citizen was a soldier, and the chief civil magistracies wielded the power of the sword, was finally abolished. All the great offices of state were accordingly re-modelled, with new titles suited to the new arrangements. They were classed in the three ranks of *Illustres*, *Spectabiles*, and *Clarissimi*, and distributed among the three departments of the court, the army, and the civil service. The officers of the court and of state were chiefly the lords of the bed-chamber and the palace, with special ministers of finance, of justice, of the interior, of the crown revenues, and of the household guards. The army was controlled by a commander-in-chief, assisted by generals of infantry and generals of cavalry; and below these were officers of inferior rank, known as dukes (*duces*) and counts (*comites*). The civil department was divided into four great prefectures: those of the east, including Thrace and the Asiatic provinces; of Italy, comprising Italy, Rhætia, Noricum, and Africa; of Illyricum, embracing Illyricum, Pannonia, Macedonia, and Greece; and of Gaul, which comprehended the provinces of western Europe. Under the four prefects were thirteen high functionaries, who presided over the thirteen dioceses into which the prefectures were sub-divided, and who were known by the titles of *comites* or *vicarii*. Asia, Africa, and Achaia were governed by proconsuls, and the whole number of provinces, each under a separate but dependent governor, a proconsul, a corrector, a consularis, or a præsidens, amounted to 117. The department of the imperial court was occupied by seven high functionaries, of a character entirely new in the history of the Roman monarchy. The chief of these was the *præpositus sacri cubiculi*, or lord chamberlain; next to him the *magister officiorum*, who may be compared to a modern minister of home affairs; the *quæstor*, or lord chancellor and keeper of the seals; the *comes sacrarum largitionum*, or chancellor of the public exchequer; the *comes rerum privatarum divinarum domus*, or lord of the privy purse; and finally, two *comites domesticorum*, or captains of the imperial body-guard. While the machinery of government was thus re-constructed, the finances by which it was to be kept in motion were placed upon a new footing. We may suppose that for many years the collection of the revenues had fallen into the utmost confusion. It had become necessary to review the entire basis of the land-tax, the most permanent and certain source of the imperial revenues; and the Indictions, or fifteen years' settlements, which became important eras for the chronology of succeeding ages, are dated from the acquisition of Italy by Constantine, in the year 312.

Political History.

Establishment of the Christian church

Discouragement of paganism.

Baptism of Constantine.

The Christian church, which the emperor determined to convert into a great instrument of government, was already modelled to his hand in the hierarchial form in which he desired to cast the state. Its metropolitans, its primates, its archbishops and bishops, with the inferior classes of clergy, formed a spiritual subordination of powers similar to that which he introduced into the civil administration, and quite unlike anything which had existed in the sacerdotal arrangements of Greek and Roman antiquity. The Romans had never recognised a distinction between clergy and laity; they had never admitted the powers of priestly absolution or excommunication; the idea of a spiritual authority independent of the civil was totally alien from their views of polity. But undoubtedly the spread of Christian ideas, and the gradual decay of those which were most essentially opposed to them, had rendered these principles more and more familiar to subjects and rulers; and Constantine was struck with the vast influence they evidently exercised over the minds of their votaries, and was prepared to subject his own fervid imagination to their control. When he found that the Christian priesthood had discovered a way of reconciling their own spiritual claims with a technical supremacy in the ruler of the state, he was satisfied with the terms of the alliance they offered to him, and quickly determined to exchange the toleration he had already extended to their religion for special favour and formal establishment. The revenues bequeathed in past times by private piety to the uses of Christian worship, which had been confiscated under the persecutors of the faith, were sedulously restored, the Christian temples repaired and reopened, many public halls or *basilicæ* especially appropriated to Christian use, and flesh endowments secured to them; the bishops and ministers of the Christian religion were invited to court, and placed in situations of trust and favour about the emperor's person. On the other hand, the institutions of pagan worship were placed under many jealous restrictions: the old distinction between public and private, licensed and unlicensed cults, was harshly enforced, and many shrines shut up, many special services abolished. The civil laws against immorality and indecency were applied to many licentious usages connected with the heathen ceremonies; and, discountenanced as the ancient worship was by the emperor and the court, it may be supposed that the magistrates were often tempted to stretch the powers accorded them by legislative enactments to the control and even the persecution of the falling faith. Personally, indeed, Constantine still halted between two opinions. Up to the age of forty at least (A.D. 314), he continued to make public profession of paganism, although he had already struck severe blows against its interests as well as its pride of exclusiveness. His devotion was divided between the gods of Olympus on the one hand, and Christ and the saints of Christendom on the other. As late as the year 321 he insisted on consulting the Haruspices. The consolidation of his power confirmed his wavering confidence in the Being whose favour he was assured he had gained, even by the limited honour he had paid to him. After the defeat of Licinius he surrendered his conscience to his favourite bishop, Eusebius of Cæsarea, allowed his children to be educated as Christians, and assumed without scruple the headship of the Church and the presidency in its councils, which its rulers freely tendered to him. It was not, however, till he felt the approaches of a mortal disease, in the sixty-third year of his life, that he finally enrolled himself among the converts to Christianity, by submitting to the rite of baptism, which he was taught to regard as the pledge of a blessed death rather than the token of a new life.

The policy indeed of the emperor, raised to a precarious elevation, and maintaining himself by force or craft against innumerable jealousies and animosities, was constantly de-

VOL. XIX.

manding the perpetration of some crime which struck his awakened conscience with horror and alarm, though he had not courage and religious confidence to repudiate it. His execution of his son Cæsius is still the deepest stain upon a character which, notwithstanding its many great qualities, must ever be subject to the charge of dissimulation and cruelty. There seems reason for questioning the justice of the charge commonly made against him, of having caused the assassination of his wife Fausta; and generally we must remember that the hostility of the pagan writers is quite as marked in their account of this prince as the favour of the Christians. It is to the encomiums of the latter, no doubt, that he owes the appellation of "the Great," which has been appended in after-ages to his name; nevertheless so distinguished a title is not undeserved by one who, not to mention his claims to the respect of Christian posterity, effected the consolidation of a vast unwieldy empire by his personal valour and ability, and maintained it in honour and prosperity against all enemies, foreign and domestic, for more than thirty years. In the history of the Christian church he assumes a prominent place, from the zeal with which he devoted himself to adjusting the dogmatic differences which prevailed in it during his reign; and especially from the council of Nicæa, at which he presided in the year 325, in which the orthodox creed was triumphantly established. But with this, and with the controversies which followed, the history of Rome has nothing to do. We have felt, during our account of the last hundred years or more, how far we have drifted away from the ideas which animated the records of Rome during the earlier periods of her existence. We can with difficulty recognise any bond of continuity between the Rome of the lower empire and that of Augustus and the Scipios. From the time that all the subjects of the empire became comprehended in a common citizenship we have lost all interest in the name of Romans. Since the edict of Gallienus, which interdicted military service to the senators, we have ceased to regard the nobles of the capital as an element in the polity of the state. The armies of the empire have long been composed almost wholly of subsidized barbarians, and been led almost without exception by provincials, half-barbarian themselves. Roman literature, which revived from the false taste of the silver age of Nero and Domitian, and produced a school at least of correct imitators under the Antonines and Severi, perished utterly in the age which followed, or was transferred to the camp of the Christians, and became the inheritance of Gauls, Africans, and Asiatics. The contempt and decrepitude into which Rome had fallen is finally marked by the incident, which may on some accounts be considered the most memorable in the memorable reign of Constantine,—the foundation of the new Rome on the Bosphorus, to which he gave the name of Constantinople, and which he made the seat of his government and the capital of the Roman empire. It was in the year 330 that this revolution was effected. Though Rome, as we have seen, had long ceased to be the residence even of the western emperors, her influence, and in some sense her authority, as a metropolis, might still be recognised as long as no rival was formally installed in the place of honour she had so long held unquestioned. The removal of the seat of empire to the East carried away many of the ancient families still surviving in the palaces of the republic; it converted the descendants, if any still remained, of the Claudii and Corneli into Greeks and Asiatics. It left the ancient Rome her name, her buildings, a more obstinate attachment to old forms and traditions, to the old pagan cult, and to the observation of heathen auguries; but it broke for ever the continuity of her political history, which must henceforth be transferred to another centre, and assume another title. (See CONSTANTINOPOLITAN HISTORY.)

Political History.

Death of Crispus.

Council of Nicæa, A.D. 325.

Foundation of Constantinople, A.D. 330.

Conclusion.

(C. M.)

Romano
||
Romans,
Epistle to
the.

ROMANO, a town of Austrian Italy, in the province and 13 miles S.S.E. of Bergamo, in a rich country, near the Seno. It is well built, with broad, straight streets, many of them lined with arcades. There are here some elegant churches, a convent, and an hospital. Silk-spinning, tanning, and tile-making are carried on; and much-frequented markets are held. Pop. (1846) 4199.

ROMANS, THE EPISTLE TO THE, claims our interest more than the other didactic epistles of the apostle Paul, because it is more systematic, and because it explains especially that truth which became subsequently the principle of the Reformation, viz., righteousness through faith. At the period when the apostle wrote the Epistle to the Romans, he had passed through a life full of experience. Paul was at this time between fifty and sixty years old. After having spent two years and a half at Ephesus, he planned a journey to Macedonia, Achaia, Jerusalem, and Rome (Acts xix. 21). Having spent about three months in travelling, he arrived at Corinth, where he remained three months (Acts xx. 2); and during this second abode at Corinth he wrote the Epistle to the Romans (comp. 1 Cor. xvi. 1-3, and 2 Cor. ix. with Rom. xv. 25). He despatched this letter by a Corinthian who was then travelling to Rome (xvi. 1), and sent greetings from an inhabitant of Corinth (xvi. 23; comp. 1 Cor. i. 14). The data in the life of the apostle depend upon the year in which his conversion took place. Some think that this event occurred as early as A.D. 35 or 41; but it is by far more probable that the epistle was written about the year A.D. 58 or 59. The congregation of Christians at Rome was formed at a very early period, but its founder is unknown. Paul himself mentions two distinguished teachers at Rome, who were converted earlier than himself. According to Rom. i. 8, the Roman congregation had then attained considerable celebrity, as their faith was spoken of throughout the whole world. From chap. xvi. we learn that there were a considerable number of Christian teachers at Rome; from which we infer that the congregation had existed there for some time; and it is most likely that the Jews at Rome were first converted to Christianity. Under Augustus there were so many Jews at Rome that this emperor appointed them quarters beyond the Tiber. These Jews consisted mostly of freedmen, whom Pompey had carried to Rome as slaves; and some of the early Christians at Rome followed mercantile pursuits. At the time when this epistle was written, there were also Gentile Christians in the Roman church; and from passages like xi. 13; xv. 16; i. 7 and 13; we learn that the Gentile Christians were then more numerous than the converted Jews. It is well known that in those times many heathens embraced Judaism (Tacitus, *Annal.* xv. 44; Juvenal, *Sat.* xiv. 96). These converts to Judaism were mostly women. Among the converts from Judaism to Christianity, there existed in the days of Paul two parties. The congregated apostles had decreed, according to Acts xv., that the converts from paganism were not bound to keep the ritual laws of Moses. There were, however, many converts from Judaism who were disinclined to renounce the authority of the Mosaic law. The opinions concerning the occasion and object of this letter to the Romans differ according to the various suppositions of those who think that the object of the letter was supplied by the occasion, or the supposition that the apostle selected his subject only after an opportunity for writing was offered. In earlier times the latter opinion prevailed, as, for instance, in the writings of Thomas Aquinas, Luther, Melancthon, Calvin. In more recent times the other opinion has generally been advocated, as, for instance, by Hug, Eichhorn, and Flatt. Many writers suppose that the debates mentioned in ch. xiv. and xv. called forth this epistle. Hug, therefore, is of opinion that the theme of the whole epistle is the following—Jews and Gentiles have equal claim to the Kingdom of God. According

Romans,
Epistle to
the

to Eichhorn, the Roman Jews being exasperated against the disciples of Paul, endeavoured to demonstrate that Judaism was sufficient for the salvation of mankind; consequently Eichhorn supposes that the polemics of St Paul were not directed against Judaizing converts to Christianity, as in the Epistle to the Galatians, but rather against Judaism itself. This opinion is also maintained by De Wette (*Einführung ins Neue Testament*, 4th ed. § 183). According to Credner (*Einführung*, § 141), the intention of the apostle was to render the Roman congregation favourably disposed before his arrival in the chief metropolis, and he therefore endeavoured to show that the evil reports spread concerning himself by zealously Judaizing Christians were erroneous. This opinion is nearly related to that of Dr Baur who supposes that the real object of this letter is mentioned only in ch. ix. to xi. The journey of Phœbe to Rome seems to have been the external occasion of the epistle: Paul made use of this opportunity by sending the sum and substance of the Christian doctrine in writing, having been prevented from preaching in Rome. The apostle had many friends in Rome who communicated with him; consequently he was the more induced to address the Romans, although he manifested some hesitation in doing so (xv. 15).

Contents of the Epistle to the Romans.—It belongs to the characteristic type of St Paul's teaching to exhibit the gospel in its historical relation to the human race. In the Epistle to the Romans, also, we find that peculiar character of St Paul's teaching which induced Schelling to call the apostle's doctrine a "philosophy of the history of man." In the Epistle to the Romans Paul commences by describing the two great divisions of the human race, viz., those who underwent the preparatory spiritual education of the Jews, and those who did not undergo such a preparatory education. The chief aim of all nations, according to St Paul, should be the *δικαιοσύνη ἐνώπιον τοῦ θεοῦ*, *righteousness before the face of God*, or absolute realization of the moral law. According to St Paul, the heathen also have their νόμος, *law*, as well religious as moral internal revelation (Rom. i. 19, 32; ii. 15). The heathen have, however, not fulfilled that law which they knew, and are in this respect like the Jews, who also disregarded their own law (ii.) Both Jews and Gentiles are transgressors, or by the law separated from the grace and sonship of God (Rom. ii. 12; iii. 20); consequently if blessedness could only be obtained by fulfilling the demands of God, no man could be blessed. God, however, has gratuitously given righteousness and blessedness to all who believe in Christ (vi. 21-31). The human race has gained in Christ much more than it lost in Adam (v. 12, 21). If some of the Jews are left to their own obduracy, even their temporary fall serves the plans of God, viz., the vocation of the Gentiles. After the mass of the Gentiles shall have entered in, the people of Israel also, in their collective capacity, shall be received into the church (xi.)

The Authenticity and Integrity of the Epistle to the Romans.—The authenticity of this epistle has never been questioned. The Epistle to the Romans is quoted as early as the first and second century by Clemens Romanus and Polycarp. Its integrity has lately been attacked by Dr Baur, who pretends that chs. xv. and xvi. are spurious, but only, as we have observed above, because these chapters do not harmonize with his supposition, that the Christian church at Rome consisted of rigid Judaizers. Schmidt and Reiche consider the doxology at the conclusion of ch. xvi. not to be genuine. In this doxology the anacolouthal and unconnected style causes some surprise, and the whole has been deemed to be out of its place (ver. 26 and 27). We however observe, in reply to Schmidt and Reiche, that such defects of style may be easily explained from the circumstance, that the apostle hastened to the conclusion, but would be quite inexplicable in additions of a copyist who

Romans. had time for calm consideration. We find an analogous instance in Ephes. iii. 20, 21, where a doxology occurs after the mystery of salvation had been mentioned: we are therefore of opinion that the doxology is rightly placed at the conclusion of ch. xiv., and that it was in some codices erroneously transposed to the conclusion of ch. xiv., because the copyist considered the blessing in xvi. 24 to be the real conclusion of the epistle. In confirmation of this remark we observe that the same codices in which the doxology occurs in ch. xvi. either omit the blessing altogether, or place it after the doxology.

Interpreters of the Epistle to the Romans.—Chrysostom is the most important among the fathers who attempted to interpret this epistle. He enters deeply, and with psychological acumen, into the thoughts of the apostle, and expounds them with sublime animation. Among the Reformers, Calvin is distinguished by logical penetration and doctrinal depth. Beza is distinguished by his grammatical and critical knowledge. Since the period of rationalism the interest about this epistle has been revived by the *Commentary* of Tholuck, the first edition of which appeared in 1824. It was translated into English in 1834–36. No other book of the New Testament has, since that period, been expounded so frequently and so accurately. From 1824 to 1844, there have been published as many as seventeen learned and critical commentaries on it; and, in addition to these, several practical expositions. In the *Commentar*, von Ruckert, 2d ed., 1839, 2 vols., we find copious criticisms of the various interpretations, and a clear and pleasing, although not always carefully-weighed, exposition. The *Commentar* von Fritzche, 1836 to 1843, 3 vols., exhibits a careful critique of the text, combined with philological explanation, but the true sense of the apostle has frequently been missed. The *Commentar* of Olshausen, 2d ed., 1840, generally contains only the author's own exposition, but presents a very pleasing development of the doctrinal contents. It has been translated into English in 1850. De Wette manifests on the whole a correct tact (3d ed., 1841); however, his book is too comprehensive, so that the contents of the epistle do not make a clear impression. Lately there has been published in French also an interpretation of the Epistle to the Romans, worked out with much diligence and ingenuity, by Hugues Oltramare.

The principal English works on the Epistle to the Romans are—Willet, *Hexapla, or a Sixfold Comment on the Epistle to the Romans*, 1611; Taylor's *Paraphrase and Notes on the Epistle to the Romans*, 1747; Jones, *The Epistle to the Romans analysed, from a development of the circumstances by which it was occasioned*, 1801; Cox, *Horæ Romanæ*, 1824 (translation, with notes); Turner, *Notes on the Epistle to the Romans*, New York, 1824 (exegetical, for the use of students); Terrot, *The Epistle of Paul to the Romans*, 1828 (Greek text, paraphrase, notes, and useful prolegomena). Stuart, *Commentary on the Epistle to the Romans*, Andover, U.S., 1832, is undoubtedly the greatest work on this epistle which has been produced in the English language; Hodge (also an American author) *On the Romans*; Peile, *Annotations on the Epistles*, 1850; Knight, *A Critical Commentary on the Epistle to the Romans*, London, 1854; Purdue, *A Commentary on the Epistle to the Romans*, Dublin, 1855; Davidson, *An Introduction to the New Testament*, London, 1848; Brown's *Epistle to the Romans*, 1857.

ROMANS, a town of France, in the department of Drôme, in a picturesque situation on the right bank of the Isère, here crossed by a handsome bridge communicating with Peage on the opposite side, 10 miles N.E. of Valence. It is still partially inclosed by its ancient walls and towers; and entered by five gates. There are no buildings in it of any note except the theatre, and the curious Gothic church of St Antoine. Silk, hosiery, woollen fabrics, serge, and

leather are manufactured here; and there is much trade in wool, hemp, linen, silk, wine, and other produce of the surrounding country. Romans has a court of commerce, chamber of manufacture, and ecclesiastical seminary. Pop. 7228.

ROMANUS I., *Lecapenus*, Emperor of the East, was admiral of the fleet on the Danube in 919, when he determined to seize the supreme power during the reign of the young prince Constantine VII. Sailing forthwith to Constantinople, he executed his enterprise with great success. The influence of the dowager empress was gained; his daughter was married to the emperor; and he himself soon afterwards assumed the title of imperial colleague, and the real authority of sole sovereign. Romanus long enjoyed the undisturbed possession of his ill-gotten power. Several predatory inroads of the wild Bulgarians were the only events that at all endangered his security for nearly five-and-twenty years. It was not until 944 that his dissolute conduct provoked a conspiracy. In that year, during the stillness of a winter noon, the two sons of Romanus seized their father in his palace, smuggled him away to a monastery on a small island in the Propontis, and that it might not be lawful for him to resume the sceptre, lost no time in shaving his head. Thus hopelessly dethroned, he commenced the quiet life of a monk, invited his unnatural sons to share his herbs and water, wher they were soon afterwards exiled to the same place, and died within the convent in 948.

ROMANUS II., Emperor of the East, succeeded his father Constantine VII. in 959. The beauty and excellences of his person made him a gymnast and a sportsman. His days were spent in the circus, in the tennis-court, and in hunting the wild boar on the Asiatic side of the Bosphorus. The welfare of his government was left to the mercy of those unprincipled times. Accordingly, in 963 his wife Theophano, a remorseless wretch, poisoned him.

ROMANUS III., *Argyros*, Emperor of the East, was living in 1028 an unambitious and married life, when a strange fortune called him to the throne. One day in the midst of his conjugal felicity a mandate came to him from the dying Constantine VIII., commanding him to repair to the palace, in order that he might be made the husband of the princess Zoe, and the successor of the emperor. He refused to leave his present spouse; but the alternative of losing his eyes was held up to him. He then preferred to suffer that penalty; but his self-sacrificing wife prevailed upon him not to forego his own welfare for her sake. The crown thus forced upon Romanus was the cause of nothing but evil. A repulse which the Arabs gave him in Syria produced a discontent among his subjects. The repeated successes of his generals against the same foe increased his unpopularity. Taking advantage of the public feeling, his faithless wife formed a conspiracy against him. At length, in 1034, she poisoned him, and gave her hand and the empire to her pajamour Michael the Paphlagonian.

ROMANUS IV., *Diogenes*, Emperor of the East, was raised to the purple in 1067 by a very romantic incident. He had been sentenced to death for treason against the Empress Eudoxia. On the eve of his execution that princess ordered him to be brought into her presence. The manly beauty of the ill-fated felon immediately won her heart. His sentence was repealed; and in a few days afterwards he found himself the husband of the empress. Romanus wore the crown worthily. Taking the field soon after his coronation, he boldly attacked the Turks, who, under the able Sultan Alp-Arslan, had encroached as far westward as Phrygia. His movements became rapid, precise, and energetic. The scattered hordes of the enemy felt themselves checked and driven back at every point. Defeat was followed by defeat, until, at the end of the third campaign, they were swept beyond the River Euphrates.

Romanus.

Rombouts
||
Rome.

The fourth campaign, however, in 1071, was ruinous to Romanus. His plans were disconcerted at the outset by the dexterous manœuvres of Alp-Arslan. He was forced to fight at a disadvantage on the banks of the Araxes. There, after struggling during a long autumn day, his troops were completely cut to pieces. He himself, fighting like a lion among the slain bodies of his attendants, was overpowered by numbers, and taken prisoner. It is true that his brave foe treated him generously, and released him under certain conditions. But on returning to his dominions he found that his subjects had rebelled. In vain did he employ force to regain his crown. He was twice defeated, was compelled to surrender, and was at last put to death with most diabolical cruelty. (See Gibbon's *Decline and Fall of the Roman Empire*.)

ROMBOUTS, THEODORE, an eminent Flemish painter,

was born at Antwerp in 1597, and studied first under Abraham Janssens, and then at Rome. His ready invention, correct design, animated expression, and brilliancy of colour, gained for him valuable patronage wherever he went. A nobleman at Rome gave him a commission for twelve pictures from the Old Testament. The Grand Duke of Tuscany employed him to embellish the palace at Florence. The citizens of Antwerp on his return hired him to paint pieces for their churches. His talent, in fact, was so much flattered that he actually entered into competition with the great Peter Paul Rubens, who was then in the full blaze of his fame. Theodore Rombouts, however, died in 1640, before he had convinced the age that he was at all equal to his competitor. One of the best known of his pictures is "The Taking Down from the Cross," in the cathedral at Ghent.

Rome.

R O M E.

THE SITE OF ROME—HISTORY OF THE CITY.

THE city of Rome is situated (*i.e.*, the observatory of the Collegio Romano) in N. Lat. 41. 53. 52., E. Long. 12. 28. 40. It is about 14 miles in a direct line from the coast, and the cross on the summit of St Peter's church may be seen above the hills from the sea. The mean level of the River Tiber, where it flows through Rome, is 20 feet above the level of the Mediterranean. This stream divides the modern, as it did formerly the ancient city, into two unequal parts, the larger portion having been always on the left or eastern bank. The modern city indeed, while it nominally retains and at one point overlaps the limits of the ancient, is chiefly built on a part only of the ancient site,—*i.e.*, on a plain formed by a sweep of the river to the north of the cluster of hills, seven, as they are commonly reputed, in number, which are historically identified with the name of Rome. These hills, which form the most remarkable feature of the locality, present a nearly continuous ridge extending over a large segment of a circle, and embracing one eminence in the centre, more distinctly marked than any of the others, named the Palatine. To the north, the Capitoline, which forms one horn of this ridge, approaches within 300 yards of the river; while to the south, the Aventine falls almost directly into it. These two hills are almost wholly separated from the common ridge, but the Quirinal, the Viminal, the Esquiline, and the Cælian present a continuous elevation of nearly uniform altitude, and are distinguished from each other only by their interior outline. On the east and south they melt insensibly with a common slope into the Campagna.¹ The Pincian, included at a later period in the city, and not counted among the seven hills, is another offshoot from this plateau to the north; and they are confronted on the opposite side of the Tiber by the Janiculan, from which the best general view of Rome may be taken, and by the Vatican. These hills are spurs of the loftier range of Monte Mario.

The calculations of the height of these hills which pretend to exactness give various and apparently conflicting results. The Janiculan, which is considerably the highest, is said to reach 260 feet near the Villa Spada; while the Vatican hardly exceeds 100. On the left bank the hills attain a nearly equal level of 150 or 160 feet. But the site of the Villa Negroni, at the back of the Esquiline, is said to be 200 feet above the level of the Tiber. As early as

the second century the Romans remarked that the summits of the hills had been considerably raised by the accretion of debris from the ancient buildings. But this accretion must be now much greater in the valleys, from the quantity of soil continually washed into them by the rains. The level of the lower parts of Rome may now be estimated generally at 15 feet higher than it was in the second or third century, and that of the Forum at considerably more. Vast masses of debris must have been wafted also into the Tiber; but so great is the scour of that rapid and often violent stream, that its bed seems not to have been raised more than two or three feet at most. Of this fact we are enabled to judge from the remains of the piers of some of the ancient bridges, and from the arch of the Cloaca Maxima, where it enters the river. Hence, though the waters often rise formidably in their deep channel, and sometimes overflow their banks, the modern city is not liable to the terrible inundations which in ancient times repeatedly carried devastation to the foot of the Pincian and the Quirinal.

The stratum of soil on which Rome immediately rests is chiefly a tertiary marine deposit; but it is not strictly correct to infer, as is sometimes done, that the spot was once occupied by an arm of the sea running up from the Mediterranean. At the period when the site of Rome was submerged beneath the waters of the ocean the relations of land and sea in these regions must have been wholly different from the present. The hills of Rome are of later origin, and have been thrust up from the surface of the marine deposit by submarine volcanic action. The base of these hills is generally a red volcanic tufa, known as "tufa lithoide," of which a great part of the ancient and modern city has been built. It was after the extrusion of these hills, according to the views of the geologists, that the surface of the Campagna was raised from the bed of the sea, and fresh-water lakes or marshes formed upon it. Again, a still later series of igneous revolutions thrust up the Alban and other volcanic hills, the craters of which are now conspicuous in the basins of Albano, Nemi, and others. Among these hills masses of fresh-water deposits are found. From the volcanic action which caused these latter changes were formed the beds of peperino, as well as of pozzolana and tufa granolare, used extensively for mortar in the buildings of the city. The primitive legend of the monster Cacus, who breathed forth fire in his cave in the Aventine, seems to indicate an early observation of the igneous for-

¹ Brocchi and Dr Arnold compare the first three of these hills, with the Pincian farther N.W., to the back of a man's hand, the fingers representing the hills, slightly forked out from one another, but connected with a common surface sloping in the opposite direction at the back, the knuckles forming, as it were, the watershed. Adopting this image, we would liken the Cælian, which is less closely connected, to the thumb; it is the right hand that must be thus compared. (See Arnold's *Rome*, i. 51, note.)

History. History
 matation of the Roman hills. Warm springs and gaseous emanations still occur within the limits of the city, and are said to have been once more widely distributed than at present.

Earliest occupation of the site of Rome. It was the observation of Cicero that Rome was admirably adapted for human habitation, from the healthiness of its situation in the midst of an unhealthy tract of country.

This is in a great measure true at the present day, some parts of the city being still remarkably exempt from the malaria common to the Campagna generally, which, however, seems to have encroached upon the site of the city itself far more than in ancient times. Partly, however, for its healthiness, but still more, it may be presumed, from its strength, as a tract of rocky hills in the midst of an extensive plain, this spot seems to have attracted settlers from a very early antiquity. To the traditions regarding these early settlements current among the Romans themselves at a later period we can only allude in passing.

The Capitoline and Janiculan are represented as the first of the summits then occupied, the one by Saturn, the other by Janus, who gave their names to the strongholds erected upon them respectively. The appellation of Janiculan survives to the present day. That of Saturnia was early lost in the name Tarpeian, supposed to be an Etruscan word for "rock," and this again gave way to the more common designation of Capitoline, now transformed into Campidoglio. The original settlement of the Palatine was ascribed to Evander, a fugitive from Arcadia, and the name of the hill itself, which has remained unchanged through all the revolutions which have passed over the site, was derived by the Roman antiquarians from the founder's son Pallas.

A more specific and circumstantial notice of the early city, though not perhaps really more historical, is that of the settlement of Romulus. This, according to the legend, was also upon the Palatine; and the stronghold here erected was said to have been surrounded by a wall running along, not the crest, but the foot of this hill, pierced by three gates, after the fashion of the cities of Etruria. A narrow belt of ground within and without this wall, under the name of *pomærium*, was kept free from buildings, and formed the limit within which the "auspices" could be taken, and the most important religious and political acts be performed. The limits of this original city are accurately traced by Tacitus, and nearly correspond, as far as we can follow them, with the trapezoidal area of the Palatine Hill, the four sides of which, measuring along the crest, vary from four to five hundred yards in length.

The Palatine and Aventine are separated by a hollow called the Vallis Murcia, through which flows a little stream named by the ancients the *Aqua Crabra*, now Marrana. Here, outside the walls, Romulus placed his circus, called afterwards Maximus, an oblong inclosure for games of skill, speed, and strength, originally of turf, afterwards fitted with wooden galleries, and lastly with seats of stone and marble. It was 600 yards in length, and was ultimately capable of holding 260,000 spectators. The stream which now creeps through this area must either have been arched over, or carried by an artificial channel on one side of it.

While the Palatine was thus occupied by the tribe of

Latins, Etruscans, or mixed races, to whom we give the name of Romans, the Quirinal, and possibly the Viminal and Esquiline, were held by a Sabine people. The Capitoline seems to have been an object of contention between them, but the Roman tradition represents these hills as originally in possession of the Romans. The reported result of the conflict may be presumed to be historical: the two hostile tribes coalesced together, divided the disputed site between them, and occupied the intervening hollow, under the name of the Forum Romanum, as a common place of meeting.

Of the foundation of cities on the Cælian and Aventine different accounts are given. The Aventine at least seems to have been assigned to an outlying tribe, politically dependent on the Romans, but not admitted to full citizenship with them. We also find this hill used as the place of meeting of the great Latin confederacy, under the patronage of the goddess Diana, whose temple stood throughout the period of Roman history on its summit. This edifice is supposed, but on very slight grounds, to have overlooked the Circus, and faced the Palatine; its exact site may in that case be nearly indicated by the existing church of S. Prisca. The temple of Romulus, under the name of Quirinus, was said to have been erected by the Sabine Numa upon the Quirinal, which then assumed that name, having been previously denominated Agonus. The fortification of the Janiculan is attributed to the fourth king, Ancus Martius, who is also said to have constructed the Mamertine prison, on the N.E. face of the Capitoline.

It was not, according to the Roman authors, till the reign of Servius Tullius that the hills of Rome were united in a single city, and included in a common line of fortifications.¹ This original circumvallation seems to have presented in some places a strong rampart of stone, traces of which are supposed to have been discovered quite recently on the slope of the Aventine, and possibly elsewhere. The rear of the Quirinal and Esquiline was defended by an earthen mound, known as the Agger Servii, and of this also some vestiges may still be detected. The heights of the Tarpeian Hill, which is generally precipitous, were left perhaps to the protection of their natural strength; and we are expressly told that the stream of the Tiber was considered a sufficient defence for the city, where it reached the river-bank. The Janiculan was probably at first an unconnected outpost, communication between the Transtiberine suburb and the city being maintained by a wooden bridge, the Sublician, placed under the care of the pontiffs, who thence derived their name (*i.e.*, bridge-makers), and repaired solely with wood down to the latest period of the empire. The actual position of this celebrated bridge is still a matter of dispute. It is generally supposed, indeed, to have stood immediately under the Aventine, where some stone piers are still visible at low water. There is great difficulty, however, in reconciling the authorities with this position, and besides that the locality seems not sufficiently central, nor to correspond with the lines of traffic on either side of the river, there is an obvious inconsistency in identifying the primitive wooden bridge with existing piers of stone.²

¹ The seven hills were those on the left bank, viz., the Capitoline, Palatine, Aventine, Quirinal, Viminal, Esquiline, and Cælian. The Janiculan was not included among them; and the several heights of the Esquiline, the Mons Cæpius and Oppius, and others, were all merged in one common appellation.

² The story of Horatius Cocles, as told both by Livy and Dionysius, seems very clearly to imply that the bridge led directly into the city. On the other hand, the account of the death of C. Gracchus in Val. Maximus and Aurelius Victor is relied on to show that it reached the left bank *outside* the walls, and the *porta trigemina* under the Aventine. These latter passages seem, however, to admit of another interpretation; at all events, Livy and Dionysius are to be preferred to the inferior writers their successors. The easy access this bridge gave to the open city might be the reason for placing it under the care of the priests and the sanction of religion,—*i.e.*, in the power of the patrician caste; and its construction in wood was to be maintained in order that it might be readily broken down at a moment's notice.

History.

Among the citadels which originally crowned the summits of most, perhaps, of these hills, it was natural that one, when all the hills were united together, should assume the pre-eminence, and become the proper citadel, or *Arx*, of Rome. The Tarpeian Hill rises in two summits, that to the N.E. being about 30 feet higher than the other to the S.W., with a small level space, known to the topographers by the name of the *Intermontium*, between them. One of these summits was already occupied by the fortress of Rome, the other was crowned by the Tarquins with the national temple which received the name of Capitolum. The precincts of this temple formed a square of about 200 feet each way, surrounded by porticoes, in the centre of which was placed, under a common roof, the triple shrine of Jupiter, Juno, and Minerva. The importance of this building, as the focus of the national rites, caused the whole hill to assume the name of Capitoline, the term Tarpeian becoming specifically restricted to the S.W. summit, or more strictly to that portion of it which presented a precipitous cliff, over which political offenders were thrown. But, strange to say, the critics are utterly disagreed as to which summit was surmounted by the *Arx* and which by the Capitol. The remains of ancient literature afford us perhaps no decisive passage on the subject, though the constant application of the epithet Tarpeian to the Capitol can hardly in fairness be explained away as merely archaic or poetical phraseology. It is not intended to enter into a discussion of the question here. It will be sufficient to say that the earliest writers on Roman antiquities, following the tradition of the middle ages, assumed that the Capitol stood on the S.W. summit; that this view was first impugned by some Italian writers in the seventeenth century, the most eminent of whom was Nardini, but they seem to have been mainly influenced by a wish to identify the Capitol with the existing church of Araceli; and possibly by a crude idea that the N.E., as the loftiest summit, was the fittest site for the most important temple in the Roman world. This view, however, was accepted with little examination, and generally prevailed among the learned, till a knot of German antiquarians, among whom Niebuhr was the most conspicuous, subjected the question to a critical investigation, and carried the tide of opinion back to the earlier theory. The native antiquarians, the school of Nibby and Canina, never indeed allowed themselves to be convinced on a point which became almost a national question, and within the last few years they have received an accession of strength from the defection to their side of the German *Æmilus* Braun, carrying with him an English writer of great authority, Mr Dyer. The Italian view now reigns triumphantly in Rome, and most of our countrymen who examine the question under the guidance of local antiquaries are naturally led to adopt it. It has been stereotyped in the minds of English travellers by the compiler of Murray's *Hand-Book*. The present writer, however, still professes himself a firm adherent of the ancient theory.¹

A monument of very great antiquity, popularly ascribed to the period of the Tarquins, and still existing in the Cloaca Maxima, or large subterranean drain, which has been traced from the river as far as the upper part of the Velabrum, a course of about 800 feet. It is said to have been constructed to carry off the waters which accumulated in the hollow between the Palatine and the Capitoline hills, together with the contents of the various sewers directed into it from other parts of the city. The network of ancient sewers beneath the streets of Rome seems to have been com-

plicated and extensive; a few of them have been discovered here and there, but there has been no attempt to make out a regular plan of them. The great Cloaca is an arched channel, vaulted with immense blocks of peperino, and 10 or 12 feet in width. It is high enough to admit one of the small waggons in use among the ancients, and Agrippa, who made a cleansing of it in the time of Augustus, went up it in a boat. The solidity and durability of this extraordinary work are deservedly admired; but an attempt has been recently made to throw suspicion on the great antiquity claimed for it, on the ground that the principle of the arch was certainly not adopted by the Romans when they tunnelled under the Alban Hills, at a much later period. Such an objection will not generally be deemed conclusive.²

One other remnant of the so-called kingly period still existing is the Mamertine prison above mentioned. It consists of two chambers, one above the other, with a hole in the floor of the upper one through which prisoners were let down into the cell below. History records the confinement of Jugurtha, Sejanus, Vercingetorix, and the Catilinarian conspirators in this dungeon: an ancient ecclesiastical tradition asserts that St Peter was also imprisoned here. The upper chamber has accordingly been fitted up as an oratory dedicated to the apostles; and a church has also been erected above it.

After the period of the Etruscans, or, as Niebuhr seems to hint, the pre-Etruscan Pelasgians, passed away, we have no more monuments of gigantic masonry to point out until we arrive at the historic era of Rome. A century, or perhaps more than one century, intervened from the date of the Cloaca and the Servian walls, and we find the city occupied by a race of degenerate mortals, who built their houses, and probably even their temples, merely of wood or baked mud, and thatched them with straw and shingles. The Forum was still a swamp, the cliffs of the Palatine and Capitoline were still fringed with briars and brushwood, when the Gauls swept away the ancient city in one great conflagration. Roman antiquarians might pretend, indeed, some centuries later, to point out the Ruminal fig-tree, the hut of Romulus, the temple of Vesta, and other monuments of a primitive age; but the genuineness of these alleged antiquities was belied by the admitted records of its history, as well as by its intrinsic improbability. The first topographical notice of the republican period on which we can rely is the reference of Livy and Pliny to the enormous substruction of the Capitoline, by which the hill itself was encased and supported, of which some trifling vestiges only can be traced under the north-east angle at the present day. But after the fire of the Gauls, the city, we are told, was generally rebuilt in a hasty and irregular manner, without regard even to the old lines of the streets, or of the sewers beneath them. The lanes which choked the plains and hollows were tortuous and narrow, with lofty houses obstructing the light and air; while the hills were almost entirely occupied by the temples, or by the mansions and gardens of the nobles. The names of a good many of the streets or alleys of the lower city are recorded; but there is hardly a single one that is known to have run over the summit of any of the hills—a significant indication that the great mass of the population was now confined, and indeed continued always to be confined, to the valleys. But indeed, in all Rome there was at this time but one street that deserves the name of an avenue, and offered a common thoroughfare for men, horses, and vehicles. This was the line along

History.

¹ It may be presumed that the early Roman history represents at least a genuine tradition, when it supposes the Tarpeian Hill to have been occupied by a fortress before the erection of the temple. It would be preposterous to imagine that the fortress was placed on the lower summit, commanded by another within half-bowshot, at a time when either might have been chosen. It would follow that the temple was built on the lower summit, i.e., the S.W.

² This is the argument of Mr Duppa, as cited by Lord Broughton in his *Italy*, vol. ii., p. 116.

History. which the procession of the triumphs passed; and it was for this and other sacred ceremonies that its width and straight direction were preserved. Entering the city at the Porta Triumphalis, near the S.W. extremity of the Capitoline, the victorious general was conducted across the Velabrum into the Circus Maximus, and so, following perhaps exactly the line of the ancient pomerium, along the valley which separates the Palatine from the Cælian. At the spot now marked by the arch of Constantine, his route made another angle to the left, climbed the gentle slope of the Velia, at the top of which he came directly in sight of the Arx and the Capitol. From hence he descended, keeping the right side of the Forum, to the foot of the Capitoline, which he ascended, making another bend to the left, by the Clivus Capitolinus, till he reached the temple of Jupiter. This road was dignified with the name of the Sacra Via. The Appian Way, which branched off from it, and issued from the city at the Porta Capena, was paved in 312 B.C., and the Flaminian in 220; but it was not till 174 that this care was extended to the streets in the city itself, and to the Clivus Capitolinus. Wherever the accretion of the soil has been removed in the line of the Sacred Way, an ancient pavement, consisting of large angular blocks of basaltic lava, has been found, still in admirable preservation.

Of all the localities of Rome at this period, the Forum alone admits of any specific topographical account. This open space, appropriated to the meetings of the Roman people, lay, as has been already indicated, at the foot of the Capitoline, and reached to the slope of the Velia, embracing the area of the modern Campo Vaccino. The Italian antiquaries have generally given it a lateral extension, between the Capitoline and Palatine, in the direction of the Velabrum; but at all events, they must confess that at a later period it was confined on this side by the Basilica Julia. This oblong space, such as we consider it, narrowing as it approached the Velia, was inclosed north and south by the lines of the Sacred and the New Way. Along these lines stood rows of open wooden booths, fronted by stone pillars; the southern row was interrupted by the house of Numa, the temple of Vesta, and possibly that of Castor and Pollux. An altar near the middle of this area marked the site of the Curtian Pool, which in early times had been a mere swamp; and three sacred trees, a vine, a fig, and an olive, were carefully preserved and renewed hard by, still showing that the spot had been formerly a jungle. The Forum was already decorated with some statues of illustrious citizens. The Comitium, an open platform raised a few steps above the Forum, was the meeting-place of the patricians, and was adorned with their curia. Upon it, and opposite to the curia, stood the rostra, the pulpit from which the orators addressed them. The Comitium may best be placed at the N.W. angle of the Forum. C. Gracchus was the first to turn, in his public harangues, from the patricians on the Comitium to the commons in the Forum below.

While the houses of the chief nobles were generally placed on the Palatine, the Cælian, or in a street called the Carinæ, on the slope of the Esquiline, the dwellings of the poor plebeians were crowded for the most part about the principal seats of traffic—the Velabrum on the one side of the Forum, and the Suburra on the other. The mansions, however, of the nobles were also frequently surrounded by the cabins of their clients, resting against their walls, so as to form a single block of building with them. A single house, standing by itself, was called a *domus*; a cluster of dwellings, such as has been just described, received the designation of an *insula*; but the little cabins which went to form the aggregate *insula* were often loosely denominated *insulae* themselves. It was not till after the reduction of the Grecian settlements in Italy, and afterwards

History. of Greece proper, that the Romans began to decorate their city with handsome architectural monuments; and these, it may be supposed, were constructed by Grecian artists, and were simply reproductions, or at least adaptations, of the Greek style. The models generally followed were the florid edifices of the Corinthian order. The most interesting of the temples of the republican period is that Concord, erected by Opimius after the slaughter of C. Gracchus. It stood immediately beneath the Intermonium, facing the Forum, and became in the last century of the republic the most usual place of meeting for the Senate. It was here that Cicero pronounced the first and last of his speeches against Catiline. Some portion of the pavement of this temple has been discovered on the spot; and the word *Concordia*, engraved upon one of the stones, sufficiently serves to identify it.

The public amusements of the Romans were consecrated to religion; and, next to the temples, we may refer to the theatres of the city. The first scenic representations at Rome were derived, not from the Greeks, but from the Etruscans, and the first theatres were constructed before the introduction of Grecian models. The Romans, indeed, had not the same facility as the Athenians for excavating their theatres out of the solid rock; it was not, therefore, till they had advanced to a high pitch of luxury and extravagance that they undertook to erect edifices of stone capacious enough to receive a large portion of the citizens. The first permanent theatre in stone was that of the great Pompeius, which was placed in the Campus Martius, the common resort of the people for purposes of entertainment. It was connected with porticoes and groves, and was combined with a temple, to which the seats of the theatre formed, it is said, a magnificent ascent. The consul Flaminius built a second circus, also in the Campus Martius, below the Capitoline. In this quarter stood also the *septa*, or polling-booths, of the Roman people, when they assembled in their military organization, by classes, to elect the magistrates of the republic; and here also, in the temple of Bellona, their generals were wont to meet the Senate on their return from foreign service, for the citizens of Rome were not suffered to enter the city under arms. During the last century of the republic the erection of basilicas, or halls for public business, and of private palaces, as well as of temples, went on with increasing magnificence, particularly in the neighbourhood of the Forum. The mansions of C. Octavius, of Æmilius Scaurus, of Crassus the orator, and of Catulus, the prince of the Senate, are specified among the finest of their day; but these were speedily eclipsed by those of Crassus the Rich, and of Lepidus (consul B.C. 78), and others. The house of this last magnate was adorned with a profusion of Numidian marble, and was esteemed the most splendid of its day in Rome; but only thirty-five years later, according to Pliny, it was outshone by no less than a hundred aristocratic mansions. The gardens of Lucullus and Sallust may be mentioned among the chief monuments of advancing luxury. The latter stood on the Pincian Hill, near the Porta Salaria, and continued to hold a high place among the ornaments of the city in the period of the emperors.

Among the most remarkable features of Roman architecture were the aqueducts, which supplied the city with water from many distant sources. Two of these were constructed under the republic,—the Aqua Appia by Appius Cæcus in 312 B.C., and the Anio Vetus, as it was called, B.C. 273, by Curius Dentatus. The first of these was led from a spot on the road to Præneste, 7 or 8 miles from the city, to the Salinæ, outside the Porta Trigemina, under the Aventine; but the water was conveyed in leaden pipes to the Porta Capena, and the twelve arches on which it was carried into the city seem to have extended only 60 paces. The second began beyond Tibur, and was not less

History.

than 43 miles in length; but this also was built on arches only 221 paces, where it entered the city at the back of the Esquiline. Such were the humble beginnings of a series of works which became at a later period some of the noblest embellishments of the city and neighbourhood.

The tribune Saturninus was blockaded in the Capitoline in the year 100 B.C.; but he was reduced to surrender by cutting the pipes which supplied the citadel, and no injury was done to the buildings. The Capitoline temple was less fortunate in the wars of Marius and Sulla, when it fell a prey to the flames, together with some adjacent buildings. Sulla plundered the unfinished Olympieum at Athens to decorate the restored edifice; and Catulus, who was charged with the task of completing it, had the honour of inscribing his name on the entablature. He added to the splendour of its architectural features, though he was forbidden to make any change in its ground-plan or proportions. Hence, though conspicuous from its position, and the centre of religious interest to the Roman people, the Capitol was neither spacious nor lofty, and we never find it extolled for the grandeur of its dimensions. Catulus rebuilt also the Tabularium, or public record office, in front of the Intermonium, between the Arx and the temple; and his name, which he inscribed upon it, has actually been discovered among its ruins in modern times.

The first
imperial
period,
B.C. 59,—
A.D. 64.

We may date the first imperial period of the city from Julius Cæsar, who commenced a great revolution in its external appearance. The Julian basilica on the right, and the Æmilian on the left, defined the future limits of the area, which must now be distinctively entitled the Forum Romanum. For Cæsar, perceiving that the population and business of the city had outgrown the accommodation provided by the Forum of the early republic, undertook to extend it with characteristic boldness and energy. The Julian Forum, which he laid out with surrounding porticoes, and a temple of Venus in the centre, to the north of the Roman, was the first of a series of works of a similar character with which succeeding emperors filled the level space at the foot of the Viminal and Quirinal. To make room for these open places in the heart of the city great numbers of the inhabitants, even though the population must have been reduced by the civil wars, were undoubtedly displaced; and from this time, perhaps, dates the first encroachment of suburban habitations on the public domain of the Campus Martius. Cæsar, indeed, designed a great extension of the Campus by turning the stream of the Tiber; but this and other projected changes were intercepted by his death. On the spot where the dictator's body was consumed—in front, that is, of the temple of Vesta in the Forum—a small chapel was erected to his divinity, which was afterwards embellished and enlarged. The spot was probably a little in advance of the modern church of St Francesca. The reign of Augustus, who succeeded him, and consolidated the empire on a peaceful foundation, forms an important epoch in the history of the city. In the first place, this emperor undertook a general restoration of the sacred buildings, which had fallen into a lamentable state of decay; but he also founded several temples of his own, together with other public edifices. Of these, the most important were the temple of Mars Ultor, which was placed in the centre of a new Forum to the north of the Julian; the temple and library of Apollo on the Palatine; the portico and library of Octavia, and theatre of Marcellus, at the entrance of the Campus Martius. Augustus constructed also a basin for mimic sea-fights and other amusements on the right bank of the Tiber, below the bridges, and a magnificent mausoleum for his family, near the modern Ripetta. But the efforts of Augustus himself were rivalled by some of his wealthiest nobles. Statilius Taurus erected a theatre in the

History.

Campus Martius, and Agrippa constructed several magnificent edifices in the same quarter, embracing baths, fountains, porticoes, and a hall for the payment of the troops, called the Diribitorium, with a roof of wider span than any other in the city. The Pantheon, generally supposed to have been a temple, but the real design of which has not been satisfactorily explained, still remains as the greatest existing monument of the Augustan city.

A tolerably vivid picture of Rome at this period is presented to us in the contemporary description of Strabo, of which we can afford room for a portion only:—"It may be said that the ancient Romans neglected the beauty of their city, being intent upon greater and more important objects; but later generations, and particularly the Romans of our own day, have attended to this point as well, and filled the city with many beautiful monuments. Pompeius Julius Cæsar, and Augustus, as well as the children, friends, wife, and sister of the last, have bestowed an almost excessive care and expense in providing these objects. The Campus Martius has been their special care, the natural beauties of which have been enhanced by their designs. This plan is of surprising extent, affording unlimited room not only for the chariot-races and other equestrian games, but also for the multitudes who exercise themselves with the ball or hoop, or in wrestling. The neighbouring buildings, the perpetual verdure of the grass, the hills which crown the opposite banks of the river, and produce a kind of scenic effect, all combine to form a spectacle from which it is difficult to tear oneself. Adjoining this plain is another (the Campus Flaminius), and many porticoes and sacred groves, three theatres, an amphitheatre, and temples, so rich and so close to one another, that they might appear to exhibit the rest of the city as a mere supplement. Hence this place is considered the most honourable and sacred of all, and has been appropriated to the monuments of the most distinguished men and women. The most remarkable of these is that called the Mausoleum, a vast mound near the river, raised upon a lofty base of white stone, and covered to its summit with evergreen trees. On the top is a bronze statue of Augustus; while under the mound are the tombs of himself, his relatives, and friends, and at the back of it a large grove, affording delightful promenades. In the middle of the Campus is an inclosed space where the body of Augustus was burnt, also constructed of white stone, surrounded with an iron rail, and planted in the interior with poplar trees. Then, if we proceed to the ancient Forum, and survey the numerous basilicas, porticoes, and temples which surround it, and view the Capitol and its works, as well as those on the Palatine and in the portico of Livia, we might easily be led to forget all other cities."¹

The regulation of Augustus, recorded by this writer, forbidding any houses to be constructed in future of more than 70 feet in height, may serve to remind us that, while the numerous public edifices of this period were systematically erected in the style of Greece, with long columnar façades, strong horizontal lines, and generally of low elevation, the private houses in the older parts of the city still retained their native character, and were tall and narrow, with projecting upper-works, and sometimes with lofty gables. The subsequent career of building in Rome was marked by the gradual displacement of the Italian by Grecian features. Augustus could boast, towards the end of his reign, though with considerable exaggeration, that he had found Rome of brick and had left it of marble: no doubt the old Italian materials of wood and brick were displaced also from year to year by masses of solid masonry which befitted a style of architecture fashioned on that of Athens or Corinth. It was not, however, till the time of Nero, when the great fire, presently to be de-

¹ Strabo, lib. v., translated in Mr Dyer's art. "Roma," Smith's *Dictionary of Classical Geography*.

History. scribed, swept away the larger part of the ancient city, that full scope was afforded for the development of this revolution in taste. Before proceeding to this epoch, we must notice the new division of the city by Augustus into fourteen regions. The four Servian quarters, which occupied the space within the old walls, were now re-distributed into six; but the walls themselves had been long neglected as lines of defence; they had been passed in almost every direction by suburban buildings, and had become obliterated, if not actually demolished, in many places. It does not seem that Augustus scrupulously preserved the old limitation. At all events, he added as many as ten new regions, including the Transtiberine, making fourteen in all, in which he embraced, we may suppose, all the continuous buildings which had grown up round the city, together with some considerable open spaces which it might be convenient to comprehend in one municipal system. It seems that the principal addition of private habitations lay in the direction of the Cælian and the lower Aventine; but the public edifices which now thronged the Campus Martius were also included in the new city, as were also the extensive range of private parks and gardens which skirted it on the north and east from the Pincian Hill to the Esquiline.

The house which Augustus first occupied on the Palatine was the modest mansion of a noble but not illustrious family. When this was consumed by fire he was encouraged by the citizens to enlarge and embellish it. He connected it at the same time with the official residence of the chief pontiff, attached to the temple of Vesta. The original *palace*, as it now came to be called, of the Cæsars occupied the north-west angle of the Palatine Hill. The chief architectural works of the next emperors were still further enlargements of the imperial residence. Tiberius extended it along the west side of the hill. Caligula made considerable additions, and seems to have connected it by open colonnades with other distant buildings. He threw a bridge, possibly of wood, over the Velabrum, to unite it with the temple of Jupiter on the Capitoline. The conceptions of Nero were still more extravagant. After commencing a temple to Claudius on the Cælian, he suspended or pulled down his work, in order to erect on the spot a wing to his palace; and he connected the house of Mæcenas, which had become imperial property, on the Esquiline, with the Palatine, by means of a colonnade, called the *Domus Transitoria*. These works, however, while yet unfinished, were interrupted by the great fire of Rome, the most important event in the history of the city, in the year 64 of our era. The conflagration commenced in the region of the Porta Capena, near the south-east angle of the Palatine, and was carried by the wind in two directions, following the course of the valleys between the Palatine and Cælian on the one hand, and the Palatine and Aventine on the other. It was not arrested till these two streams of fire had met again in the Forum or the Velabrum. Thus they completely encircled the Palatine, and swept at the same time the base of most of the other hills. They were not yet entirely extinguished when a second conflagration burst out in the Via Lata, N.W. of the Capitoline, and the wind having veered to the opposite direction, some portions of the city which had hitherto escaped fell now a sacrifice to its fury. Of the fourteen regions, four, it is said, were wholly consumed, and seven others more or less injured: three only escaped unhurt. Generally the lower parts of the city, the old plebeian quarters, suffered more than the elevations. The buildings on the Capitoline were uninjured; those on the Palatine only partially damaged; but the old monuments of the republic in the Suburra, the Forum, the Velabrum, were swept entirely away. Space and opportunity were now presented for the re-construction of the city in the fashionable style of Greece, and the very

eagerness with which Nero improved the occasion in the taste of the day, lent a colour to the imputation current against him, of having actually kindled the flames, or at least of having forbidden them to be extinguished.

With the aid of his architects, Severus and Celer, Nero undertook to rebuild Rome after the manner of the great oriental capitals. Antioch, indeed, and Alexandria, as well as the chief cities of European Greece proper, occupied areas for the most part level, and it was impossible to carry out on the varied surface of the seven hills the uniform plan of rectangular streets and places which characterised the architecture of the East. But the avenues of the restored city were now widened and straightened as far as was practicable; the great blocks of houses were generally surrounded by colonnades; the height of the private buildings was diminished; and the basements at least, even of the plebeian cabins, were constructed of stone. The old inhabitants complained, we are told, of the loss of their lofty houses and narrow alleys, which at least afforded shade from the sun and shelter against the winds. They were right perhaps in alleging that the architecture of Egypt and Syria was not suited to the variable climate of Rome. The restoration of the city was carried on with great vigour, and seems to have been nearly completed during the four remaining years of Nero's reign. The emperor repaired and completed his palace also, which occupied the heights of the Palatine, Esquiline, and Cælian, connected together by a vast series of colonnades. The principal entrance seems to have been placed near the site of the Colosseum, erected, as we shall see, a few years later, and named from the colossal statue of Nero in the atrium of the palace. This enormous edifice was not less remarkable for its decorations within and without than for its size, and received from thence the designation of the Golden House. Another of Nero's architectural works was the circus he constructed for his private amusement on the slope of the Vatican, the scene of the cruel martyrdom of the Christians, and possibly the spot on which the church of St Peter's now partly stands.

The civil wars which followed on the death of this tyrant are memorable in the history of the city, from the burning of the Capitol, the narrative of which clearly shows that the Arx had become wholly untenable, and was held of no account for the defence of the hill. Vespasian undertook the restoration of the temple, and was allowed to raise its elevation, but not to enlarge its foundations. The restoration was hardly finished when the temple was again destroyed or damaged by an accidental fire, and the repairs of Domitian seem to have been still more magnificent. The gilding of the roof is said alone to have cost the incredible sum of 12,000 talents, or nearly three millions sterling. The embellishment of the city by the Flavian emperors and their next successors was conducted on a more magnificent scale than ever. Vespasian destroyed the greater part of the Golden House, restricting the imperial palace once more to the Palatine Hill, and transferring to public uses the areas thus recovered from it. One part of the site he devoted to a temple of Claudius on the Cælian, some remains of which are supposed now to exist, from which we may estimate the extent of ground it occupied at not less than one of the squares of London. He constructed a new forum at the foot of the Esquiline, which received its name from the temple of Peace in its centre; above all, he converted the site of Nero's fish-ponds into an arena for his vast amphitheatre, which is known by the name of the Colosseum. Titus transformed a portion of the palace on the brow of the Esquiline into public baths of unprecedented extent and splendour. Domitian erected the triumphal arch, which still exists, in honour of his brother. This prince commenced also a new forum, to connect that of Peace with the older constructions of Julius and Augustus,

The culminating period of the city, A.D. 64-271.

History.

and adorned it with a temple of Minerva, but the work was completed by Nerva. The equestrian statue of Domitian in the Roman Forum has been described by Statius in lines interesting to the topographer, from the aid they give him in determining the sites of various buildings in that quarter,—of the basilicas, for instance, of Julius and Æmilius, of the temples of Vespasian and of Concord under the Capitol, of Castor and Pollux and of Vesta at the foot of the Palatine.

The long period of peace and prosperity which followed was signalized by the erection of a series of magnificent buildings. Trajan completed the imperial forums by opening a new area beyond the Julian and Augustan, cutting through the low ridge which joined the Capitoline and Quirinal, to get a level space for his extensive works. This Place also was decorated with a temple, and its site is defined for us by the column still standing in its centre, which was surmounted by a statue of the emperor. The principal works of Hadrian, besides the completion of Trajan's forum and temple, were the temple of Venus and Rome, with two cells back to back, the largest of all the sacred edifices of the city, on the eastern slope of the Velia, and the colossal mausoleum erected for his own sepulchre, now known as the castle of St Angelo, on the other side of the Tiber. The Mole of Hadrian, as this building was popularly designated, was connected with the Campus Martius, now almost wholly occupied with buildings, by the Pons Ælius, still existing.

The fashion of erecting commemorative columns, first set, at least on a large scale, by Trajan, was followed by both the Antonines. The column of Pius was indeed of much smaller dimensions. It was found in fragments lying on the ground early in the last century, and an unsuccessful attempt was made to raise it. The base has been since removed to the garden of the Vatican. The column of Aurelius still stands, and forms one of the most conspicuous objects in the centre of the modern city. Under Commodus the city suffered again from fire, but the particulars of the disaster are not known. Severus built the Septizonium, a large edifice raised on seven ranges of columns, in imitation perhaps of the mausoleums of Augustus and Hadrian. This building is frequently mentioned in the history of Rome in the middle ages, but its site has not been satisfactorily determined. The triumphal arch of Severus, still standing at the foot of the Capitoline, is the noblest of the ancient monuments of its kind now existing. The Antonine baths, which exceeded in extent those already mentioned of Titus, filled a large space beyond the Porta Capena, and seem to show that the population was not densely located at this time in that quarter. The erection of this work is ascribed to Caracalla: probably it was finished by Alexander Severus. The series of aqueducts introduced into the city, already eight in number, was completed by the Aqua Alexandrina of this latter emperor, by which these baths are supposed to have been supplied. Alexander constructed also a new circus in the Campus Martius, the limits of which are precisely defined by the existing Piazza Navona. The city had arrived at the height of its splendour, extent, and population, when it was finally encircled with a continuous line of fortification by the policy of the Emperor Aurelian.

History.

The walls with which Aurelian surrounded Rome were meant as a defence against the attacks, now first apprehended, of the barbarians, and were so drawn as to embrace all the continuous buildings pertaining to the city. They comprehended pretty exactly the whole of the fourteen regions of Augustus, with the addition of the camp of the prætorians, which had lain originally beyond their limits. On the left bank of the river they corresponded very closely with the line of walls now existing; on the right they included the Janiculan Hill, but did not extend to the Vatican. No certain vestiges, however, of this fortification can now be discovered. A space, indeed, of about 40 feet at the slope of the Pincian Hill, remarkable for the inclination of the wall from the perpendicular, presents a specimen of *opus reticulatum*, a species of brick-work belonging, it is said, to the period of the early Cæsars. It would seem, therefore, that at this point at least Aurelian connected his work with some building already in existence. We have, however, no other traces of construction which can be referred with confidence to any very ancient date. Even in the time of Honorius these walls had fallen into decay, and required considerable repairs; an operation which was repeated, as we shall see, by Belisarius, and again by Narses.

The actual circuit of the walls of Rome has been very variously stated. Some of the ancient authorities on the subject have been misunderstood, but others are manifestly in error. The best measurements have been made by the simple process of walking round them. The Servian *enceinte*, as far as it can be traced, has thus been found to extend to about 8 miles, that of Aurelian to $12\frac{1}{4}$.¹ This agrees very nearly with the statement of Pliny, that the *mœnia* of Rome had a circuit of 13 m. p. The word *mœnia* has been taken for the walls; and as the walls of Pliny's time were the so-called Servian, it has been thought that for xiii. we should read viii.² *Mœnia*, however, properly implies not walls, but continuous edifices, and was used no doubt by the author to indicate the extent of the regions of Augustus, comprehending the actual city of his day.

This conclusion is important, as it furnishes us with the best data we possess for determining the population of Rome. There are, indeed, a variety of proofs that the suburbs of the city were never either extensive or populous, derived from the paucity of remains beyond the walls, from the practice of lining the roads for miles with sepulchral monuments, from the absence of bridges across the Tiber either above or below the walls, and from the frequent mention of country villages, lanes, and retired woods at but a short distance from the gates. We may conclude, then, that the mass of the population was strictly confined to the limits comprised within the walls of Aurelian.

Although, however, these walls are above 12 miles in circuit, about the same as the outer boulevards of Paris, it must be observed that they do not inclose a regular figure, and the area they embrace is far less than it would be if the circumference, as at Paris or ancient Athens, approached a circle or ellipse.³ We have seen that, in the time of Augustus, a large proportion of the area was very thinly inhabited; and even in later times indications are not

¹ Lord Broughton's *Italy*, i., p. 308, note. The author adds, however, that in trying the distance with a pedometer, he found it "considerably less."

² This is the solution adopted by Dureau de la Malle in his *Econ. Pol. des Romains*, i. 345, after D'Anville.

³ The area of Rome has been accurately measured at 3263 acres. We may compare this with the areas of some modern cities, as given in the *Quarterly Review*, vol. xcix., p. 445:—

	Acres.	Population.	Average Density.
1. West London.....	2547	199,885	75
2. Central London.....	1938	393,256	203
3. Liverpool (Central).....	1830	255,055	131
4. Calcutta (excluding the suburbs).....	4796	413,182	86
5. Florence.....	1297	95,927	74
6. Frankfort-on-Main.....	1212	66,244	50
7. Paris.....	8026	1,050,000	130

History. wanting that great spaces within the city were still occupied by gardens and pleasure-grounds, while the extent of the public buildings seems to have constantly increased.¹ The emperors appear to have experienced no difficulty in clearing the ground for their enormous constructions. On the whole, Rome in the Augustan age cannot have stood on more ground than the city of the present day, nor in the time of Aurelian did it occupy a greater space than Naples; and these Italian cities present in many respects the fittest objects to compare with it. When we add that, while repeated fires were thinning the density of habitation, new regulations were introduced for reducing the height of houses; that Trajan fixed the limit at 60 feet, while in London they rise very generally to 70 or 80, and in modern Rome and Naples still higher;—we shall be content perhaps with a very moderate estimate of the population of the ancient city. Into other data, at best uncertain, for fixing it, we cannot here enter; but, judging from the extent of the area, and the character and density of the buildings, we shall hardly believe that it ever approached to the number of one million.

Desertion of the emperors, and attacks of the barbarians. From the time of M. Aurelius, the Roman world was visited by a succession of pestilences, which, it may be supposed, would fall most heavily on the areas of densest population. It seems probable, however, that whatever loss Rome sustained from this cause during the century which followed would be compensated by the crowding into it of the distressed and impoverished people from the towns and country round. We cannot infer that the numbers of the urban population actually diminished along with the undoubted decline of the empire generally in the third century.

The first great blow that was struck at the numbers of the city was the building of Constantinople. Several of the noblest and wealthiest families then quitted the Tiber for the Bosphorus, and carried with them their troops of clients and families of slaves. The servile population had now ceased to draw recruits from successful frontier wars, and the decay of general affluence must have rendered the breeding and maintenance of this class unprofitable. The construction, however, of splendid edifices still continued after the age of the Severi, though we may guess, from the example of the arch of Constantine, that older buildings were often pillaged to decorate the new. Aurelian erected the temple of the Sun on the Quirinal, the substructions of which are still seen in the gardens of the Colonna palace; the arches of Gallienus and Constantine exist at the present day; the baths of Diocletian were equal in extent and splendour to those of Titus or Caracalla; Maxentius and Constantine erected the great Basilican, the remains of which are among the most conspicuous monuments of Roman antiquity. The walls, it is said, were completed by Probus.

But with these works the additions to the splendour of the ancient city terminate. When Constantius visited Rome he was struck with admiration at its architectural magnificence, and despairing of leaving any monument of himself which should vie with those of his predecessors, was satisfied with offering, as his humble tribute, an obelisk erected in the Circus Maximus. Two centuries later, a noble column, still standing, was raised to the Emperor

History. Phocas in the Forum; but this, it is supposed, was taken from some earlier edifice. Honorius is extolled by the poet Claudian for breathing new life into the ancient city, but his merits seem to have been really confined to some partial repairs of the walls, which we cannot suppose to have fallen into general decay in little more than a hundred years. His minister, Stilicho, set the first example of pillage, in carrying off the gilded plates on the doors of the Capitoline temple. The first assault of the barbarians quickly followed. Alaric entered Rome in 410 by the Salarian Gate, and gave the nearest parts of the city to the flames. Procopius, writing a century and half later, ascribes the destruction of the house of Sallust, such as he witnessed it in his own day, to this disaster. The extent indeed of the damage may not have been great. The Goths remained only six days in Rome, and could not, had they been inclined, have demolished or injured many of the buildings in that short time.

The second sack of Rome was that by Genseric and the Vandals in 455. The Gothic historian Jornandes, who had denied the imputation of barbaric violence applied to his own countrymen, speaks of the *desolation* inflicted by the rival conqueror. The Vandals occupied the city fourteen days; but they employed themselves too diligently in collecting its treasures to spend time in destroying its massive edifices. The golden candlesticks and table of the Holy of Holies, taken from Jerusalem by Titus, are specified among the spoils of Genseric. When these objects were recovered by Belisarius, they were sent as precious trophies to the Christian capital of the empire. The Vandals carried off one-half of the gilt tiles on the roof of the Capitol; and a vessel laden with gold and silver statues was lost on its way to Africa. In 472 Rome was sacked a third time by Ricimer; but the object of this adventurer was a political revolution, and he was animated by no hostility to the people or city. It is not probable that he inflicted any great amount of damage, and indeed he too died within forty days.

Thus far we cannot suppose that Rome had suffered any material damage in her external appearance, nor such as might not have been speedily effaced had she retained spirit and resources for repairing the loss. To some extent, indeed, both of these were supplied by Theodoric, who succeeded to the supreme power in Rome in the year 493. Cassiodorus mentions by name several of the chief monuments of the city as existing at this epoch in their ancient splendour, and considerable sums were now set apart for the repair of those which time or violence had injured. For this purpose also, marble was imported from Greece by the successors of Theodoric, Amalasuntha and Deodatus. At this period the public games might still be witnessed in the Circus Maximus, and the Claudian aqueduct was in play. Such indeed was the case with the aqueducts generally, which were first broken down, as we are expressly told, in the attack of Vitiges (A.D. 537), when the country round Rome was devastated by the Goths. To resist this attack, Belisarius, who then held the city for the Greek emperor, repaired the walls, and fortified the Mole of Hadrian. In the course of the siege the defenders hurled many statues from the walls of this edifice upon the heads of the assailants. But the sack of Totila, which followed in 546, was

It will be seen that, computing the area of Rome at 3263 acres, it would contain, if peopled on the scale

Of No. 1, a population of 274,224	Of No. 4, a population of 280,618
" 2, " 662,389	" 5, " 259,536
" 3, " 379,487	" 6, " 159,150
Of No. 7, a population of 424,190	

The population of modern Rome, it may be added, is now about 180,000; that of Naples 450,000.

¹ Besides the numerous large edifices, theatres, circuses, &c., already specified, we are informed that Rome possessed 424 temples, most of them with external areas and sacred groves attached; 265 squares or open places, and that Agrippa alone erected 170 baths for the use of the people. See these and many other details in *Dureau de la Malle*, i. 350, &c.

History.

marked by the burning of some portions of the city, especially that beyond the Tiber. This conqueror overthrew also a third part of the walls. The city is said to have been deserted by its inhabitants, and the barbarian threatened to turn its site into pasture ground. It is still affirmed, however, that he was diverted from the execution of his threats against the buildings and monuments of Rome by the remonstrances of Belisarius, who, on the retreat of the Goths, once more repaired the walls, and repulsed another attack. The city, indeed, was subsequently surrendered to Totila by treachery; but the invader now established himself there, not as an enemy, but a sovereign, and caused no further injury. After his death it reverted once more to the rulers of Constantinople, after having been taken and retaken five times in the course of twenty years, but with more loss perhaps to the harassed population than to the buildings themselves. With Totila the damage inflicted by the barbarians may be said to terminate. The Lombards devastated the Campagna in 578 and 593, but did no injury to the city. As late as 754 the walls were assaulted by the German Astolphus, and the buildings which lay near them may have suffered from his violence; and we thus reach the era of Charlemagne, and the general recognition of Papal Rome as the centre of mediæval civilization.

Effects of the establishment of Christianity.

During the period of five centuries, at which we have glanced in the last section, while Rome was subjected to the effects of imperial neglect on the one hand, and of barbarian crime on the other, a third cause of decay was also in operation, which contributed no doubt more than either of these to change the face of the city, and obliterate its ancient topography. This was the establishment of Christianity, or, to speak more precisely, the transition from the old religion to the new.

Constantine first allowed the Christians to make use of some public halls for their worship. We cannot indeed specify any such case with certainty; but the application of the term *basilica* to five of the larger and eight smaller churches in Rome, and the evident derivation of the style of Roman ecclesiastical architecture, sufficiently attest the fact. Though the internal decorations, especially the statues, of these pagan edifices, would be destroyed on their application to the religious service of the Christians, we may believe that the practice of conversion was on the whole favourable to the preservation of this class of structures externally. But with the temples the case was different. It is impossible but that, in the decline of paganism, these sacred buildings must have suffered from neglect, even before the churches of Christianity rose to supplant them. Neither Constantine nor his immediate successor ventured to close them. Theodosius, who destroyed the temples at Alexandria, still spared those of the pagan metropolis. But the violence of the Christians grew with their strength. In 399 the edict of Honorius suspended all the temple services; and the clause which forbade any outrages to be committed on the buildings themselves seems to show, not only that such were to be apprehended, but that they had been already offered. Augustine boasts in one place that all the statues in the Roman temples had been demolished, but he speaks elsewhere of temples and sacred groves being appropriated to Christian worship and sanctified thereby; and we must suspect Jerome of his usual exaggeration where he exults in the general ruin which, as he asserts, had fallen upon the sacred places of the heathens. At all events, there is no more brilliant description of the pagan shrines of Rome than that of Claudian, himself a pagan, at the very epoch to which we are now referring. At last, in 426, the younger Theodosius issued an edict for their destruction, and this edict is generally supposed to have been carried out pretty completely. It is said that from this era we meet with no reference to the temples in the imperial legislation; but this

History.

indeed was hardly to have been expected when the temples had ceased to be public property or objects of public interest. It is not strictly true that from henceforth there is no mention of them in the narrative of political events. Procopius in the sixth century alludes to the temple of Peace as then existing, with other similar monuments, and particularly describes the form, the dimensions, and the material of the temple of Janus. The populace, he says, Christians though they nominally were, attempted to open the gates of this temple as a protection against an advancing enemy; a trait of superstition which shows that they still retained a lurking respect for the ideas of antiquity; and would have revolted against any indiscriminate attack upon their monuments and emblems. If, however, these venerable edifices escaped a general proscription and demolition, they fell for the most part by a more lingering process, being despoiled from time to time by the cupidity or caprice of the private owners into whose hands they came. Thus in the reign of Justinian, a Roman matron, the proprietor of a ruined temple on the Quirinal, presented eight of its columns to the emperor for the decoration of S. Sophia. Vast numbers of columns, friezes, and entablatures, were thus transferred to Christian churches. The application of the temples themselves to ecclesiastical uses was more rare, and is believed to have begun rather later. The Pantheon had escaped destruction or serious mutilation down to the seventh century; it was converted into a church in the year 604, in which year the gilded tiles of the temple of Venus and Roma were also transferred to the roof of St Peter's basilica. We know, however, of four or five only of the ancient temples which were equally fortunate with the Pantheon,—those, namely, which were dedicated to SS. Cosmas and Damianus; to St Stephen, St Hadrian, and that of Vesta or Romulus, which has assumed the name of St Theodore. On the other hand, we read of not less than fifty-six churches erected on the sites of temples either previously destroyed or actually pulled down for the purpose. The destruction of the theatres, baths, and circuses, together with other places of public resort, in which the magnificence of the ancient city had most conspicuously displayed itself, must be ascribed more directly than even that of the temples to the change of religion, sentiments, and manners. Against the social institutions to which these buildings were devoted the early Christian preachers had most sedulously inveighed; the converts were instructed to shun them, as the strongholds of the idolatry, cruelty, and sensuality which disgraced the heathen world. It was long indeed before the Roman populace, even when Christian in name, could be effectually weaned from their fascinations: the games of the circus did not, it is said, finally cease till 496, and the baths were not perhaps wholly deserted till the overthrow of the aqueducts which supplied them. But as early as the tenth century there were three churches standing within the area of the baths of Alexander, which must have been previously deserted and in ruins. The immediate causes of the destruction of these monuments must be looked for in those natural agencies to which we shall next refer, and which we shall find to have been really far more effectual in their operation than either the fury of the barbarians or the fanaticism of the Christians.

The popular charges against Pope Gregory the Great, of having urged the destruction of temples, the demolition of statues, and the burning of libraries, have been chiefly derived from the declamatory assertions of John of Salisbury, a writer of the twelfth century. Gregory himself, we may believe, would have disclaimed the praises of his fanatical panegyrist. He has left us in memorable words his own mournful impression of the decay and ruin of the great city around him, which he ascribes to the operation of tempests, earthquakes, and inundations. Such agencies,

Decay of the city from natural causes.

History. as we learn, had been always more or less in activity on the spot, but in better times the injury they inflicted was speedily repaired by the energy of a vigorous and increasing population: at this period there was neither strength nor spirit to retrieve the accumulating disasters. Pestilence and famine had repeatedly succeeded to the calamities of war; the remnant of the citizens had been driven more than once in terror from their dwellings, and many no doubt had abandoned them for ever. At the second siege of Toul there was so much vacant soil within the city as would have sufficed to maintain both the inhabitants and the garrison. Sufferings and apprehensions had blunted every sentiment of national pride or interest. The Romans had become ignorant of their own history, or at least indifferent to its monuments; they were wholly insensible to the grandeur and beauty of their works of art; they left their noblest statues to be buried in the gradual accretion of soil, as in the baths of Antoninus and Titus; while the names and uses of their most illustrious edifices sank into oblivion around them.

Against the agencies above enumerated a people so listless could not contend. The rains swept the soil from the hills into the valleys; the inundations undermined the buildings; the earthquakes overthrew them. A rank vegetation grew up among the ruins, and embedded them in its accumulating debris. There is evidence, from certain appearances in the walls, that even when Honorius repaired them the soil had already risen in some places to several feet above the original level. In modern times excavations on the hills, but still more in the lower parts of the city, and especially in the Forum, have exhibited a rise of level of 10, 15, or even 20 feet. The process of accretion is thus described by Lord Broughton:—"Such open spots as were decorated by single monuments were likely to be first overwhelmed by the deposit left by the water and collected round those monuments. On this account the forums, and even the Palatine, though on an eminence, being crowded with structures, appear to have been buried deeper than the other quarters under the deposit of the river and the materials of the crumbling edifices. The latter accumulation must be taken into account when it is recollected that the broken pottery of the old city has at some unknown period been sufficient to form a mount of 150 paces high and 500 paces in length. The population was too languid to dig away the obstruction, and employed their remaining strength in transporting the smaller materials to the more modern and secure quarter of the town."¹ The failure of the supply of water from the aqueducts would help to drive the dwindling population to the banks of the river; and in the eighth and ninth centuries, when the number of inhabitants had fallen perhaps to its lowest point, a large proportion of the area within the walls was occupied with fields and vineyards, the people crowded together under the western slope of the Capitoline, and in the nearest portions of the Campus Martius, where the oldest parts of the modern city are at this day to be found.

History of the city in the middle ages.

The city of the Cæsars had sunk to its lowest degradation about the end of the eighth century; its old habitations had been destroyed, even the course of most of its streets obliterated; the remains of antiquity were confined to the bare walls of palaces and temples, and a few other monuments of unusual strength and solidity. Of these remains a list is given by a topographer of the next age, according to the division, still it seems remembered, of the fourteen

History. regions. It includes the baths of Alexander, Commodus, Trajan, Sallust, Diocletian, and Constantine; temples of Jupiter and Minerva; the Roman Forum and that of Trajan; the three circuses; the arches of Severus, Titus, Gratian, Theodosius, and Valentinian; the Flavian and prætorian amphitheatres; the Capitol, the Septizonium, the palace of Nero, and another, pretending to be that of Pontius Pilate; the theatres of Pompey and Marcellus; the Trajan and Antonine columns; a Nymphæum; an obelisk; several remains of aqueducts and porticoes; together with various specimens of ancient sculpture.² These monuments, it will be observed, still for the most part exist; their continued preservation will be presently accounted for; but the demolition of the ancient city had already advanced at this period almost to the point at which it has now arrived, a thousand years later. A change, however, now occurs in the history of Rome. The spiritual importance which begins to attach to her as the centre of Christendom, and the spot from whence the chief of the revived empire is content to derive his authority, inspires her government with a renewed sense of dignity. The Popes, now the acknowledged masters of the venerable city, attempted in every interval of domestic tranquillity to repair the most vital injuries she had suffered. The Aqua Virgo was made again to convey water to the dwellings about the Pantheon, and the Claudia to those which encircled the Lateran. A new town was rising under the protection of St Peter's, which Pope Leo VI. fortified in 846, and gave it the name of the Civitas Leonina, now the Borgo. Rome had become a cluster of little towns, one of which grew up around each of her principal sanctuaries; and from this time her records teem with notices of the building of new churches, and even the restoration of old ones. The Papal city had itself become an antiquity.

The exemption, however, which Rome now enjoyed from foreign assault encouraged the citizens to dissensions among themselves. The strongest monuments of the old city still standing were seized by the barons and converted into fortresses. Even the monasteries sought to protect themselves by similar means. Thus the convent of S. Gregory on the Cælian had its outposts in the Septizonium and the arch of Constantine; while other religious houses made use of the columns of Trajan and Antonine for bell-fries. In the twelfth century the noble family of the Frangipani had possession of many ancient buildings, such as the Colosseum, the Circus Maximus, the Septizonium, the arches of Titus and Janus; the Orsini occupied about the same time the mole of Hadrian and the theatre of Pompeius; the Colonna the mausoleum of Augustus and the baths of Constantine; the Savelli maintained themselves in the theatre of Marcellus and the tomb of Cæcilia Metella; the Corsi had fortified the Capitol, and were in possession of the basilica of S. Paul. The Pantheon was defended as a fortress for the Pope.³ We may suppose that the defiant attitude assumed by the holders of these places of strength provoked mutual hostilities; but they were preserved at least from natural decay by the pains taken to fortify them. We can trace, however, some of the damage inflicted upon them in the struggle between the Popes and Emperors, and we may guess at more. Rome was attacked more than once by the emperor Henry IV. In the siege of 1082 the portico of St Peter's suffered injury; in the following year that of Hadrian's mole, or castle of S. Angelo, was destroyed.⁴ The assaults were generally directed

¹ Lord Broughton's *Italy*, i. 373.

² Bunsen's *Rom.* i. 246; Lord Broughton's *Italy*, i. 387.

³ The modern name of this monument is derived from a chapel once erected on its summit by Pope Gregory the Great at the close of the sixth century, and dedicated to the archangel Michael, who was said to have appeared on the spot and protected the city from a pestilence. The name of S. Angelo, however, does not seem to have been applied till several centuries later. The mole was first fortified by John XII. about 960, again in 1378, and finally in 1644. It is now used as a state prison. All the upper part is modern.

History.

against the Transtiberine portion of the city, and in 1084 the Borgo was overthrown. At the same time the long colonnade which connected St Paul's-beyond-the-walls with the city was demolished. Thus far the injury inflicted had lighted chiefly on objects comparatively modern; but the emperor now penetrated the walls, and made a furious attack on the Capitol, which caused the ruin of many ancient remains. The outrages of the imperialists, however, were far exceeded by those of the Normans and Saracens, who recovered the city for Pope Gregory VII. under Robert Guiscard. These savage allies burnt their way from the Flaminian Gate to the Antonine column, and they assaulted with barbarian violence both the Capitol and the Colosseum, and laid waste the area of the city from thence to the Lateran. The greater part indeed of this space was at this time uninhabited, and even uncultivated. The remains of the several borgos were thus separated by desert tracts; and William of Malmesbury, in writing of this lamentable period, could describe Rome as "quite a small city." At the end of this century, under Innocent III., it is said to have contained only 35,000 inhabitants.

In the thirteenth century the violence of the nobles was brought in some degree under the control of the municipal government, and the senator Brancalcione caused the demolition of 140 baronial "towers." These were perhaps for the most part turrets of brick erected on the summit of the ancient monuments, but their destruction extended in many cases, as we are specially assured, to the monuments themselves; the extent, however, of the demolition has probably been exaggerated,—at least the check it inflicted was incomplete and transient. We continue to hear, again and again, of the feudal castles in Rome: as many as forty-four existed, it is said, at a much later period in a single borgo.

The removal of the Popes to Avignon in the fourteenth century tended on the whole to the preservation of the ancient remains. It was a period of stagnation, with less of violence on the one hand, and less of improvement and embellishment on the other, which were almost equally fatal to monuments of merely antiquarian interest. The lamentations of Petrarch over the desolation of Rome are generally taken as a sign of its advancing ruin. Perhaps they should rather be regarded as a favourable symptom. They exhibit the first indication of an interest in antiquity, and an anxiety to preserve what was perishing. The abortive attempts of Rienzi were not ineffectual for the great end he had in view, to revive among his countrymen the love of their city and pride in their historic recollections. But in the middle of the century the venerated spot was visited with an inundation and an earthquake of more than usual violence, in which some of the ancient as well as more modern monuments were overthrown. The continued absence of the Popes, as Lord Broughton remarks, might have been fatal to the city, and reduced it to a solitude; "but such a solitude," he adds, "would have protected many a fragment, and preserved the ruins at least for the eyes of a more inquisitive generation." The return of the Popes, and the new population which followed in their train, introduced a new series of injuries, in the conversion of the old materials to other objects. "The Colonna and the Orsini, the people and the church, fought again for the Capitol and the towers; the fortress of the Popes, the refitted mole of Hadrian, repeatedly bombarded the town;" but the injuries thus inflicted on the imperial remains were less serious than the pillage to which they were to be again subjected by the Papal re-constructors and beautifiers.

The return of the Popes from Avignon was soon succeeded by the great western schism, which suspended the restoration of the city for forty years; but the era of its re-construction in the general form it now presents may be

dated from the pontificate of Martin V. (1417). This was the most flourishing period of the Papal power, when its revenues were most abundant, and its authority throughout Europe uncontested. The last revolt of the Romans was suppressed in 1434 by Eugenius IV., and the work of building and restoring was now carried on rapidly and without interruption for many years. A great many of the churches of Rome date their origin from this century, and perhaps a still larger proportion of its palaces, erected for the most part by the Popes themselves, or by the families they founded. The monuments of imperial Rome still existing, and especially the enormous Colosseum, supplied inexhaustible quarries of travertine to the builders. Nicolas V. has been called the Augustus of modern Rome; but he stripped the ancient edifices of their marble to burn into lime, and left only the brick. So rapidly did the work of demolition proceed that Pius II. was obliged to interfere with a bull in 1462 to arrest it. But the interdict seems to have been little regarded, and this Pope is himself accused of building the palace of St Mark with materials taken from the Colosseum. In 1474 Sixtus IV. destroyed what remained of the stone piers of the supposed Sublician bridge to make cannon balls. Alexander VI. constructed his gallery from the Vatican to the castle of St Angelo with the fragments of a pyramid destroyed for the purpose. Pius III. plundered the temple of Antoninus and Faustina, the arch of Titus, the forum of Trajan, and the theatre of Marcellus; and built the Farnese palace with stone from the Colosseum. Sixtus V. removed some works of art from the Septizonium to decorate St Peter's. "The stupendous vaults of the Diocletian thermæ were converted into churches; the walls of those of Constantine were adjusted into the Rospigliosi palace; the Alexandrine thermæ supplied with columns the repairs of the Pantheon; a circus was gradually cleared away for the opening of the Piazza Navona; the marble of a temple on the Quirinal was cut into the 124 steps which ascend to the church of Araceli."¹ The fountain of Trevi and the Barberini palace were constructed by Urban VIII. with materials taken from the Colosseum; he also stripped the porch of the Pantheon of some sheets of bronze, which, strange to say, had so long escaped the spoilers of the city. These last and other acts of barbarism were perpetrated in the middle of the seventeenth century; and finally, Alexander VII. destroyed the arch of M. Aurelius about 1660, as an obstruction to the street called the Corso. "Those who peruse the topographers from Blondus to Nardini will assign to the latter half of the fifteenth century, and the succeeding 150 years, a greater activity of destruction than to those immediately preceding ages in which we have no authentic writers to tell us what was left or what was lost."²

The laying out of the plan of the city as it now exists dates from the pontificate of Sixtus IV. (1471-1484). A peculiar feature of modern Rome, as distinguished from other cities, is the combination it presents of long and straight avenues with clusters of the narrowest and most tortuous alleys. We see before us in this respect a repetition of Rome as it was rebuilt after the fire of Nero. From the Capitoline (Campidoglio), the Quirinal, and the centre of the old Campus Martius respectively, three streets, the Corso, the Babuino, and the Scrofa, converge upon the Porta del Popolo, near to the site of the old Flaminian Gate. The first of these runs partly, possibly indeed altogether, in the line of the Flaminian Way, and it is evident that they must have all been driven through the habitations, long deserted perhaps, of an earlier generation, and that many ancient remains must have been sacrificed to them. In the same manner, we are informed, the remnant of Nerva's forum was removed

History.
The rise of the modern city to the middle of the 17th century.¹ Lord Broughton, *Italy*, i. 421.² *Ibid.*, i. 423.

History.

to make way for the Via Alessandrina; and other antiquities were demolished to effect a communication between the forum of Trajan and St Maria Maggiore. During almost the whole of the period now before us, the modern church of St Peter's was rising in its incomparable grandeur (1450-1626). Before the secession to Avignon, the Popes had inhabited the Lateran. On their return, they took up their residence in the Vatican, chiefly on account of its proximity to the friendly shelter of St Angelo. From that time they continued to enlarge and beautify this palace, till its length has extended to 1151 and its breadth to 767 feet, and it contains by exact computation 4422 rooms.¹ The square of palaces which occupies the centre of the Campidoglio was built by Paul III. (1534-1549), from the designs of Michael Angelo, and is ascended by a stair on the northern slope of the hill, the side which in ancient times was regarded as inaccessible. The Popes have another residence on the Quirinal, in a palace commenced by Gregory XIII. in 1574, and enlarged by several succeeding pontiffs down to Urban VIII.

By the middle of the seventeenth century Papal Rome had reached perhaps its full extent, and enjoyed a splendour which it has hardly since maintained. Though not free from the ravages of fire and inundation, once only during the period of its restoration it suffered a great disaster from martial violence. In 1527 it was stormed by the constable Bourbon, and surrendered to a lawless soldiery for the space of nine months. Churches and palaces were pillaged, and the paintings and frescoes which had begun to decorate their walls were subjected to considerable damage. Nevertheless, the outcry of the sufferers, who declared that the troops of Charles V. inflicted more devastation than the Goths, is no doubt exaggerated. They plundered, but they do not seem to have destroyed. At all events, the condition of Rome was now very different from what it had been in the fifth or sixth century. The spirit of the people and their rulers was vigorous and elastic; their resources were overflowing; and whatever injury they might occasionally suffer from the hands of man or from natural causes they easily retrieved and obliterated. Had Charles V., says Donatus, returned to Rome in the pontificate of Urban VIII. (1623-1644), he would not have recognised the city he had seen from the top of the Pantheon.²

Petrarch and Rienzi in the fourteenth, and Poggio in the next century, pleaded for the ruins of ancient Rome, and raised at least a momentary enthusiasm in their behalf. The revival of classical learning gave force and permanence to the feeling they had awakened. The sixteenth century witnessed first its development in the classical and almost pagan tastes of Leo X. and other chiefs of the Papacy, by whom the first steps were taken in collecting statues and works of art, and uncovering the foundations of imperial Rome. About 1520, Raphael, who had witnessed the discovery of the remains on the Esquiline, and had himself copied the arabesques in the chambers of the palace of Nero, could venture to draw a plan of ancient Rome from his own investigations and conjectures; but the great painter's zeal as an antiquarian met with little encouragement. Some of Leo's successors affected to condemn the devotion of the classicists to the monuments of a godless superstition; and though Paul III. (1534) is favourably known for his enforcement of the edict against their destruction, as well as for the erection of the noble Piazza del Campidoglio from the designs of Michael Angelo, Sixtus V. (1585) distinguished himself on the other side by removing "the heathen statues on the towers of the

Capitol," by which we may understand perhaps the marbles there collected by the taste of his predecessors.³

This Pope deserves honourable mention, however, for his repairs of the Trajan and Antonine columns, and for the species of consecration he bestowed on them by crowning them with statues of St Peter and St Paul respectively. He sought perhaps to preserve the Colosseum from further spoliation by establishing a manufactory in it, an experiment which was repeated by Clement XI. a century later; but in both cases the scheme proved abortive. It was not till 1750 that the building was consecrated by Benedict XIV. to the memory of the Christian martyrs who had perished in the arena. The arch of Constantine had been restored by Clement XII. in 1733, on the ground of its connection with the triumph of the Christian faith. It would seem that some excuse of this kind was necessary to plead the cause of heathen antiquity against the interest or fanaticism of the populace. In 1817 Lord Broughton might remark, perhaps with bitter truth, that "the frequent repairs of the Pantheon, those of the Antonine and Trajan columns, the erection of the obelisks, the restoration of the Cestian pyramid, and the late protection of the Flavian amphitheatre, with that of the arch of Constantine, seem to compose the sum of all the merits of all the Popes, as far as respects the stable fabrics of antiquity." "The taste and magnificence of the Popes must be sought and will be found," he adds, "in the museum of the Capitol and the Vatican,"—the first commenced by Clement XII. (1730), the latter designed and executed by Clement XIV. and Pius VI., from whom it derives the name of Museo Pio-Clementino. "It was reserved," he continues, "for the conquerors who plundered those noble repositories to recompense Rome for her losses by clearing away the offals and dirt which had accumulated for ages round the buried temples at the foot of the Capitol and under the windows of the Senate-house, by cleansing the base and propping the porches of the Colosseum, by removing the soil in front of the temple of Peace [the basilica of Maxentius], by re-opening the baths of Titus, and, finally, by excavating the forum of Trajan." In 1858 the same author has added in a note—"There is no doubt that in that short period (1810-1814) more was planned and executed by the French administration than by all the Popes and other successive masters of the Eternal City from the fall of the empire to the beginning of the present century. But it would be unjust not to acknowledge that recent Popes have not forgotten their duties in this respect. Gregory XVI. in particular, whose political policy has been denounced as cruel and unjust, cannot be said to have neglected the arts of peace." Of late years the greatest pains have been taken to strengthen and preserve the Colosseum and other antiquities. The bases of several temples, arches, and columns, especially in the Forum, have been laid open, and the original pavement of the Sacred Way uncovered through a portion of its course. Pius VII. established the Museo Chiaramonti and Braccio Nuovo for ancient sculptures in the Vatican; and Gregory XVI. the Etruscan museum in the Vatican, as well as a museum of Christian antiquities in the Lateran. Under Pius IX. the rows of tombs on both sides of the Appian and other ancient roads have been uncovered, and a new class of objects of the highest antiquarian interest brought to light. The same pontiff, now reigning, has evinced a laudable zeal in promoting the exploration of the catacombs; and the promised work of the Cavaliere di Rossi, in which the subject will be critically discussed after the investigation is

Statistics. completed, may be expected to settle at last the questions so long debated about their use and origin. (C. M.)

STATISTICS OF ROME.

Basilicas.

It has been said that perhaps no city in the world abounds with such a number of churches as Rome, or with fewer handsome ones as respects their architecture. Seven of the earliest churches of Rome are still called Basilicas, and enjoy a metropolitan rank. Four of them are within the walls,—St Peter's, St John Lateran, Santa Maria Maggiore, Sante Croce in Gierusalemme; and three outside the walls,—S. Paolo, S. Sebastiano, and S. Lorenzo.

St Peter's.

Foremost among them all is St Peter's, which Gibbon styles "the most glorious structure that has ever been applied to the use of religion." It occupies the site of a Basilica built by Constantine in 306; but has nothing except the name in common with the ancient style of buildings. Of the present church the foundation was laid by Julius II. in 1506, and the building was dedicated by Urban VIII. in 1626; its erection having been spread over the reigns of twenty Popes, and carried on by twelve different architects, the most celebrated of whom were Bramante, who planned the building in the form of a Greek cross with a hexastyle portico, and a cupola in the centre, and erected the piers and arches that support the dome; Raphael, who changed the plan from a Greek to a Latin cross; Michael Angelo, who returned to the former, and designed the dome; Giacomo della Porta, who completed the dome; and Maderno, who returned to the Latin cross plan, and added the *façade*. Of all the parts of the building, the work of the last architect is the most open to criticism; for the front, as seen from the piazza, is so prominent as almost to hide the dome; whereas, had Bramante and Michael Angelo's plan of a Greek cross, and a *façade* like that of the Pantheon, been followed, the whole dome would have been seen from the piazza. The situation, too, of the building is singularly unfortunate, in a hollow surrounded on three sides with hills; so that the exterior view does not show the church to advantage. But the interior is unrivalled for grandeur and beauty; its immense size is not perceived on account of the exquisite proportions of the whole, and the colossal dimensions of the statues in the niches and the mosaics on the dome.

The stupendous dome, viewed in its design, its altitude, or even its decoration, is altogether unrivalled, and has justly been pronounced the triumph of modern architecture. The ascent to the top of the church is so gradual as to be accessible to persons on horseback; from thence the dome is reached by a succession of ingeniously-contrived staircases. From the top an extensive prospect may be obtained of the beautiful amphitheatre of hills which incloses the Campagna on all but the western side; the summits of the loftier Apennines behind, wreathed with snow; the Tiber in its sinuous windings through the district; in the distance the blue waters of the Mediterranean gleaming in the sunbeams; and, far beneath, Rome, with her churches, her palaces, her dark and distant ruins, the rich verdure, and golden fruit of the orange gardens of her convents, contrasting with the deep shade of their mournful cypresses. Beneath the dome stands the high altar, under a canopy of solid bronze, covered with the richest ornaments. The monuments are for the most part unworthy of the church; but to an English visitor there is a singular interest in Canova's monument of the last of the infatuated and unfortunate race of Stuart. The principal dimensions of St Peter's are as follows:—Length in the interior, 613 feet; breadth of the nave and aisles, including the pilasters that divide them, 197½ feet; height of the nave, 152 feet; length of the transepts, 446½ feet; diameter of the dome, including the walls, 195 feet, or nearly 2 feet more than that of the Pan-

theon; diameter of the dome in the interior, 139 feet, or 3 feet less than that of the Pantheon; height from the pavement to the base of the lantern, 405 feet; to the summit of the cross outside, 448 feet. Thus the whole of St Paul's cathedral in London might stand within the shell of St Peter's, and yet leave 46½ feet at either end, 25 feet all round the cupola, and 64 feet above the dome. The semicircular colonnades on each side of the piazza in front of the church, form, along with the covered galleries that extend from them to the portico, a magnificent approach to St Peter's.

The basilica of St John Lateran is another most interesting church, and as it is considered the "mother of all churches in the city and the world," its chapter takes precedence even of that of St Peter's. It stands at the east of the Cælian Hill, on the site of the house of Plautius Lateranus, a senator put to death by Nero, but has been so frequently restored and altered as to retain little of its original form. In a portico to the north of this church stands the Scala Santa, twenty-eight marble steps, said to have belonged to the palace of Pontius Pilate, and protected by planks of wood from the attrition caused by the knees of the devout who ascend. This church was the place where the five general councils, known in history under the name of Lateran councils, were held in 1123, 1139, 1179, 1215, and 1512.

The basilica of Santa Maria Maggiore, more than any other in Rome, preserves the simple character of the ancient buildings, and has one of the finest interiors in this style.

The old basilica of St Paul *fuori le mura*, founded by Constantine, and rebuilt by Theodosius and Honorius, contained 138 pillars of the rarest marble and granite, the spoils of some of the noblest edifices of antiquity. In 1823 this church was destroyed by fire, but it has since been rebuilt in a style of even greater magnificence than before, and open to public worship, and dedicated by Pius IX., in 1854.

The church of St Clement, on the slope of the Esquiline, has the reputation of occupying the site of the house of Clement, the companion of Paul. The churches of the Jesuits and of St Ignatius are distinguished for their riches, and the immense number of ornaments which they contain. The church of Santa Maria sopra Minerva, built on the site of Pompey's temple of Minerva, contains the celebrated "Christ" of Michael Angelo, and in the church of St Pietro in Vincoli is the famous statue of Moses by the same artist. Many of the churches of Rome are adorned with fine paintings by the greatest masters, but their beauty and colouring has generally suffered much from time, neglect, dirt, and damp. In the church of Santa Maria della Pace are the four "Sybils" of Raphael, and the church of St Augustine contains his inimitable fresco of "Isaiah." A number of admirable paintings in fresco by Domenichino adorn a chapel in the church of San Luigi de Francesi. The church of the Capuchins possesses Guido's celebrated painting of the "Archangel Michael trampling upon Satan." Domenichino's "Ecstasy of St Francis," and a cartoon by Francesco Beretta representing St Peter walking upon the waves also adorn this church. Daniel da Volterra's "Deposition from the Cross," which Poussin pronounced to be the third picture in the world, enriches the church of the SS. Trinità de Monti. The house of Claud Lorraine stood beside this church; on the opposite side of the way was that of Nicholas Poussin, and close by it a house once inhabited by Salvator Rosa. The church of San Andrea della Valle is built upon the spot where the curia of Pompey once stood, in which Cæsar fell. It contains some fine paintings in fresco by Domenichino, representing the Four Evangelists. In the church of San' Onofrio the remains of Tasso repose.

There are in Rome 54 parishes and 364 churches, 186 convents, and numerous benevolent institutions.

Nothing strikes a stranger with more admiration on his arrival in Rome than the immense number of fountains

Statistics. which pour forth on every side an inexhaustible supply of the finest water. They exhibit great variety in their composition. Some of them are beautiful; one or two grand; but they are all, generally speaking, deficient in simplicity, and several of them, such as the renowned fountain of Trevi, are completely overloaded with mythological sculpture.

Palaces. Rome has more palaces, or noblemen's houses, than any other city in the world. Of these, no fewer than seventy-five are of a superior kind, uniting in their external appearance something of the fortress, the prison, and the palace. Many of the families to which these buildings once belonged have sunk into poverty, and their residences are now turned into ecclesiastical colleges or hotels, or let to foreign ambassadors or consuls. In the others which have escaped this fate the lower storey is sometimes let for shops, sometimes retained for stables, coach-houses, and servants' rooms. The second storey is generally a picture gallery, consisting of a suite of rooms opening into one another, and richly adorned with marble columns and painted ceilings. The owner of the building and of these precious works of art often lives in the third or highest storey, and generously throws open the gallery to artists and to all who choose to give two or three paoli to the servants. The exterior of these palaces is in general grand and magnificent in architecture; but in the interior, notwithstanding the magnitude of the apartments and the magnificence of the decorations, they are, generally speaking, uncomfortable dwellings, and most of them are deficient in cleanliness and order. The immense palaces of the Doria, the Colonna, and the Borghese, are still occupied only by their own families and dependants. The Doria palace contains the largest collection of paintings in Rome, among which are found some of the finest specimens of the ancient masters. The gallery of the Colonna palace, which is by far the grandest hall in the city, once contained a number of celebrated paintings, but the finest have been sold. The palace garden, which hangs on the steep side of the Quirinal Hill, contains the picturesque remains of a magnificent ancient edifice, the name of which is unknown. The palace of the Barberini family formerly contained that celebrated museum of ancient sculpture, vases, gems, medals, &c., which was so long the wonder and admiration of Europe, but it is now sold and dispersed. The famous Portland vase was brought from this museum. There are still some interesting pictures, among which the famous "Cenci" by Guido Reni. The palace of the Borghese once contained a fine museum of sculpture, and it still possesses one of the best collections of paintings in Rome. In the Palazzo Massimi is the famous "Discobolus," found in the grounds of the Villa Palombari on the Esquiline Hill. The Palazzo Spada contains the celebrated statue of Pompey, at the foot of which Cæsar fell. In the palace of the Braschi once stood the beautiful colossal statue of Antinous, which was dug up on the site of the ancient Gabii, and has been removed to the Lateran museum. The Palazzo Nuovo di Torlonia, the residence of Torlonia the Roman banker, who has purchased the title and estate of the Duca di Bracciano, is fitted up with all the magnificence that wealth can command. The gallery is adorned with Canova's colossal group of "Hercules and Lycas." The Farnese palace contains the far-famed gallery painted in fresco by Annibal Caracci. In the gallery of the Sciarra palace are Raphael's "Player on the Fiddle," Lionardo da Vinci's "Vanity and Modesty," and other masterpieces.

The Vatican. The Vatican has long been celebrated for its unrivalled splendour and magnificence. Its ceilings richly painted in fresco; its pictured pavements of ancient mosaic; its magnificent gates of bronze; its polished columns of ancient porphyry, the splendid spoils of the ruins of imperial Rome; its endless accumulation of Grecian marble, Egyptian gra-

nites, and oriental alabasters; its bewildering extent and prodigality of magnificence; but, above all, its amazing treasures of sculpture, far surpass even the gorgeous dreams of eastern magnificence. In common with all the other collections of the fine arts in Rome, the Vatican suffered materially from the rapacity of the French, but on the downfall of Bonaparte the stolen treasures were restored to their rightful owners. The Vatican contains a museum filled with the most splendid specimens of ancient sculpture: the tapestry chambers hung with tapestry woven in the looms of Flanders, and copied from the cartoons of Raphael; a picture gallery, filled with the masterpieces of painting; "the Cameie" and "Loggie" of Raphael, painted in fresco by himself and his pupils; the Sistina and Paolina chapels, painted in fresco by Michael Angelo; and the library, the halls and galleries of which alone are more than 1300 feet in length. The view from the balcony in front of the windows gave the name of *Belvedere* to an octagon court of this museum, surrounded by porticos and cabinets, in which is the matchless statue of Apollo Belvedere, pronounced by universal consent to be the finest statue in the world. It was found near Antium, in the ruins of a Roman villa, supposed to have originally belonged to Nero. The name of its artist is unknown. Here, also, are the Belvedere "Antinous," "Perseus," and the "Two Boxers," by Canova, and the celebrated group of the "Laocoon," which Pliny states to have been executed by Agesander the Rhodian, and Athenodorus and Polydorus, who are believed to have been his sons. This wonderful masterpiece was found in the palace of Titus, on the very spot where it is described by Pliny to have stood; and every successive generation that has passed since it was found has gazed with admiration on its matchless sublimity. The Vatican also contains the two finest paintings in the world,—the "Transfiguration" by Raphael, and Domenichino's "Communion of St Jerome." The library contains a splendid collection of books, and is peculiarly rich in rare and valuable manuscripts. But a minute account of the immense treasures of art accumulated in this magnificent building would occupy too much of our space. Another of the Pope's palaces, the Lateran, was converted into an hospital in 1693, and into a museum in 1843.

The museum of the Capitol contains a very extensive collection of specimens of ancient sculpture. **Museum of the Capitol.** The finest works in it are the famous statue called the "Dying Gladiator," found at Antium in the same spot with the "Apollo Belvedere," and the "Fighting Gladiator;" the two Furietti "Centaur;" the group of "Cupid and Psyche;" the noble seated statue of Agrippina, the wife of Germanicus; the "Camillus;" the bronze urn which bears the name of Mithridates; the four doves, a mosaic, which must be either the original or a copy of the famous mosaic of Sosus, in the temple of Pergamus, described by Pliny; the "Venus" of the Capitol; and the celebrated bronze wolf, with the Roman twins, supposed to be that alluded to by Cicero as having been struck by lightning. The Capitol contains also a museum of painting, but it is of comparatively inferior interest. The academy of St Luke, in the Forum, contains Raphael's famous picture of "St Luke painting the Virgin's portrait." Rome contains eleven public libraries, some of which are excellent. In the Augustine convent there is one, called the *Angelica*, containing upwards of 90,000 vols. and 3000 MSS.; and the *Minerva*, adjoining the Dominican convent of Sta. Maria sopra Minerva, contains 120,000 vols. and 4500 MSS. They are open daily to the public.

There are a great many villas in the immediate vicinity of Rome, and even within its walls. **Villas.** The gardens of the Villa Borghese, which were by far the most beautiful pleasure-grounds at Rome, were almost wholly ruined during the revolution of 1848. The villa, with its works of art, however, was preserved. The Villa Ludovisi, within the walls of the city, is nearly two miles in circuit. It contains

Romford
||
Romilly.

an invaluable collection of celebrated pieces of ancient statuary, of which no copies are known to exist. The magnificent Villa Medici, on the Pincian Hill, is now converted into the French academy, where a number of young artists of promise are supported at the charge of the French government, with the view of enabling them to enjoy the advantages of a few years' study at Rome. The Villa Albani is enriched with the most precious collection of ancient sculpture that any private cabinet ever contained. The finest specimens of this collection are the famous "Apollo Sauroctonos," the most beautiful bronze statue now left in the world, and which, in the judgment of Winckelmann, is the original of Praxiteles, described by Pliny; the statue of Minerva, which is pronounced by Winckelmann to be the only monument now existing at Rome of the sublime age of art that lasted from the age of Phidias to that of Praxiteles; and the far-famed relieve of Antinous, which, says the same critic, "after the 'Apollo' and 'Laocoon,' is perhaps the most beautiful monument of antiquity which time has transmitted to us."

Castle of
St. Angelo.

The castle of St. Angelo, "the mole which Hadrian rear'd on high," was originally called "Moles Hadriani," from the name of its founder, who destined it to hold his remains for ever. It is a circular building, and was formerly reckoned very strong; it has stood many sieges, but as a fortress it is wholly untenable against modern tactics. It has been so often taken and retaken, repaired and altered, that but little of the original structure now remains, except the walls. It communicates with the Vatican by a long covered gallery, made by Pope Alexander VI. to afford him a way of escape from the just fury of his subjects. The castle of St. Angelo is now used as a place of confinement for prisoners sentenced to the galleys. The upper part of it also serves as a state prison for criminals of rank, and those who fall under the suspicion and displeasure of the Pope.

ROMFORD, a market-town of England, in the county of Essex, on the left bank of the Bourne or Rom, which is crossed by a bridge, 12 miles E.N.E. of London. It is generally well built, and consists of one principal street, long and wide, having a market-house and town-hall near its centre. The old parish church, which was a beautiful specimen of the early English and Norman architecture, has been replaced by a modern building, to which many of its ancient monuments have been transferred. There are also Wesleyan, Independent, and Baptist churches; national, infant, and other schools; a literary institution, work-house, and savings-bank. Agricultural tools are manufactured here, and many of the inhabitants are employed in farming and market-gardening. There is a considerable trade; and the place is noted for its markets for corn and cattle, as well as for its ale. Romford is a place of great antiquity, and stands at or near the site of the ancient Roman Durolitum. Pop. (1851) 3791.

ROMILLY, SIR SAMUEL, one of the most enlightened and virtuous public men whom England has ever possessed, was, as his family-name indicates, the descendant of a French family. He was the son of a jeweller in London, and was born there on the 1st of March 1757. The education of this child, destined in time to occupy so distinguished a place, was conducted for some time with even less care than might have been expected from the station held by his family. But heartily disliking his father's business, he was at length allowed to change it for professional employments, though as yet in an inferior department. At the age of sixteen he was articled to one of the six clerks in Chancery; and in the easy mechanical duties of his master's chambers, relieved by the zealous prosecution of his studies both in English and Latin, passed several years of his life. He then resolved on coming to the bar, a step which, he informs us, all his friends, with one exception, considered as highly imprudent. One circumstance which helped to

Romilly.

The city of Rome is divided into fourteen quarters or *rioni*, twelve on the left and two on the right bank of the river. These accidentally correspond in number, but not at all in size or situation, with the regions of Augustus. The municipal government is in the hands of a senator appointed by the Pope, and eight conservators and forty councillors, elected by their own body, along with two delegates from each of the *rioni*. All hold office for six years, with the privilege of re-election; and one-half of the conservators and councillors go out every three years. One-half of the body is taken from the nobility and landowners, the other from the middle classes. The police of the city, however, is not under their jurisdiction, but under that of the director-general of police, who is a member of the ministry, subordinate to the minister of the interior and secretary of state. There are no important manufactures in the city. Catgut, perfumes, artificial flowers, silk, leather, cloth, and other articles, are indeed made; but Rome is more celebrated for its mosaics and cameos. There are many artists, engravers, and copyists of ancient works of art in the city.

The population, which at its greatest height, in the second or third century, we have not been able to estimate so high as a million, amounted, according to the census of 1858, to 179,950. "It has been nearly stationary," adds the author of Murray's *Hand-Book*, "for the last ten years; the highest point it ever reached in modern times being 180,200 in 1846. It was 153,000 in 1800, from which it decreased gradually until 1813, when it was only 117,900." Gibbon estimated it in his own time, but we know not from what precise data, at 170,000. It may be remarked that the buildings of the modern city seem to occupy fully one-half of the Aurelian area, and are probably more closely packed, as well as loftier, than those of the empire.

determine Romilly was very interesting; the purchase of a seat in the office in which he had been articled would have cost a sum which he knew it would be inconvenient for his father to advance. He had completed his twenty-first year when he entered himself at Gray's Inn, becoming at the same time a pupil of an able equity-draftsman. General reading both in English and Latin, translation habitually practised from the latter language into the former, the composition of a few political essays for newspapers, and occasional attendance on the houses of Parliament, now alternated with a closeness of application to legal study which, after a time, injured his health, and compelled him to retire, first to Bath, and afterwards to the Continent. At Geneva he became acquainted with some of the men who were then beginning to attract notice in that city; and among acquaintances thus made the most valuable was that of Dumont. After visiting some of the nearest scenery of the Leman Lake, and of Savoy, Romilly proceeded to Paris, where he met D'Alembert, Diderot, and other eminent men. On the last day of Easter term 1783 he was called to the bar. For some years afterwards he obtained an increasing employment in the drawing of chancery pleadings; but during this time, as he says himself, he had hardly once occasion to open his lips in court. In the spring of 1784 he went upon the midland circuit, which he continued to frequent until, even as admitted in his own modest Memoir, he was decidedly its leader. Long before he left the circuit, he had attained a distinguished position in the eyes of those who were qualified to appreciate him, not merely as a lawyer, but as a statesman. In 1784 he became acquainted with Mirabeau, who was then in London, and of whose character he appears to have formed an exceedingly just estimate. Mirabeau was the medium through which Romilly became known to Lord Lansdowne, and thus to the leaders of that political party of which he had throughout been an honest and warm

Romilly. adherent. To that nobleman he was recommended both by the hearty praises of Mirabeau and by a pamphlet he had written, called *A Fragment on the Constitutional Power and Duties of Juries*. Lord Lansdowne, directing Romilly's attention to a recent sanguinary tract on Criminal Punishments, induced him to write an answer, which was published anonymously under the title of *Observations on a late Publication entitled 'Thoughts on Executive Justice.'* In the meantime he continued vigorously to prosecute in private the inquiries into the reform of the laws, especially the criminal laws, of which he had thus begun to announce publicly the parts.

In the vacation of 1788 he paid a third visit to Paris. Introductions from England, and other circumstances, brought Romilly and his fellow-traveller Dumont into intercourse, upon this occasion, with many men distinguished then, and with others still more celebrated in the bloody struggle that was about to ensue. Mirabeau at this time translated into French, and published, observations made by Romilly on the hospital and prison of Bicêtre. This pamphlet had the honour to be suppressed by the police of Paris, but in the original English was afterwards printed by the author himself in an obscure London periodical. In July 1789 Romilly wrote a pamphlet which was afterwards published, *Thoughts on the Probable Influence of the French Revolution on Great Britain*. But the lively interest he took in the events which emerged in Paris, while he was engaged in composing these remarks, led him back to that city in August of that year; and he now saw, both in public and private, many of the persons who had become most distinguished in the National Assembly. Dumont's observations upon the eventful summer of 1789 in France were translated into English by Romilly, and, with the addition of some observations by himself on England, were published in 1792, receiving the title of *Groenvelt's Letters*. Many of Romilly's opinions on the progress of the French revolution are contained in his published correspondence with Dumont, Madame Gautier, Dugald Stewart, and others, and in a diary which he kept during a journey to Paris in the autumn of 1802. While Romilly was thus advancing to the highest rank in his profession, and had gained the confidence and admiration of some of the best statesmen in England, his domestic position underwent a most beneficial change, the immediate cause of which was a visit paid to Lord Lansdowne. His marriage with the eldest daughter of Mr Garbett of Knill Court in Herefordshire took place in January 1798, when he had nearly completed his forty-first year.

He continued to be chiefly occupied in the discharge of his duties as a leader of the Chancery bar for several years, after which he united with these the other avocations that have given to his name so distinguished a place in the list of British satesmen. In the autumn of 1805 he had received from the Prince of Wales the offer of a seat in Parliament, which he declined upon grounds strongly marking his sturdy independence of character.

In February 1806 he was appointed solicitor-general under the government of Mr Fox and Lord Grenville, with neither of whom had he previously any connection. He was obliged, much against his will, to accept the honour of knighthood, and was elected to represent the borough of Queenborough, accepting this seat, without scruple, from the government. In March 1807 the Whigs were overthrown, and Parliament was dissolved. In the new Parliament he was returned for Horsham, on the Duke of Norfolk's interest, and he subsequently purchased the representation of Wareham. Defeated in an attempt to represent Bristol in 1812, he was returned for the borough of Arundel by the Duke of Norfolk. This seat Romilly held till the dissolution in 1818, when he accepted a requisition from the electors of Westminster, upon which he had the satis-

faction of a triumph after a severe contest. The results to which this great victory was expected to have led were unfortunately never realized. Lady Romilly, to whom he was very greatly attached, died on the 29th October 1818, and the shock occasioned by that event so preyed upon his health that he put an end to his life on the 2d of November 1818, in his sixty-second year.

The public character of Sir Samuel Romilly would be best drawn by a few warm and vigorous strokes, all of which, with no exception worth noticing, would convey images of distinguished excellence. These traits would exhibit his manly and ratiocinative oratory, lighted up into eloquence by the fervour of his moral sense, that antique spirit of mental independence which bowed to the demands of no man and of no party, not even his own, unless his conscience told him that those demands were just. And these virtues of the statesman and the jurisconsult, which, by their stern majesty, commanded from those that viewed them at a distance an awe not altogether unmingled with fear, were tempered in private life by the warmest and kindest feeling, by the most felicitous union of public labours with personal accomplishments. His second son, the Right Hon. Sir John Romilly, was made Master of the Rolls, in March 1851. (See *Memoirs of Sir Samuel Romilly*, written by himself, 3 vols., London, 1840.)

ROMNEY, GEORGE, an eminent English artist, was the son of a cabinetmaker, and was born near Dalton in Lancashire in 1734. Although placed at the age of eleven in his father's shop, he soon began most vigorously to develop his genius for painting. His fellow-workmen were his models; the deals which he planed were his canvas; the living world around him was his school. In course of time his progress became so marked that his father was induced to apprentice him to a portrait-painter of the name of Steele at Kendal. There he applied himself sedulously to discover the secrets of colouring. A marriage which he contracted at the age of twenty-one only gave a stimulus to his ardour. He laboured for six years in painting the likenesses of the country squires of Westmoreland. Then, villainously deserting his wife and two children, he set out in 1762 to seek his fortune in London, and took up his abode in Dove Court, near the Mansion-House. It was not long before the manliness and poetic dignity of Romney's style began to ensure success. The Society of Arts awarded him a prize for his "Death of King Edmund." Other historical pictures followed, which were said by his admirers to rival the old Italian masters. He was also in the meantime receiving numerous commissions for portraits. His emoluments from that branch of his vocation became so considerable that he was enabled to spend about two years at Rome in studying Raphael and Michael Angelo. Nor did he fail, on his return to London in 1775, to take a higher place in his profession. He set up his studio in a spacious house in Cavendish Square. Many of the noble and the distinguished became his sitters. It even began to be said that he was dividing the rich province of portraiture with Sir Joshua. Scarcely less than thirteen hours a day sufficed to meet all his engagements; scarcely less than L.3000 or L.4000 was realized in a year. Romney, as he grew older, became more and more engrossed with ideal painting. His active imagination found its subjects in many fields of literature,—in Shakspeare, in Milton, in classical mythology, and in the sacred Scriptures. The greater part of those designs he left unfinished on the canvas, to litter his studio and every spare corner of his house. Romney's nerves became unstrung, and his mind became unhinged. He imagined that the dwelling in Cavendish Square was too small for the execution of his great projected works. Nothing would satisfy him but to build a large whimsical pile on Hampstead Hill. The removal thither in 1797 only exasperated his disease. His

Ronda.

nervous uneasiness had become so great in 1799 that he suddenly left London by the coach, and hastened northward to Kendal to seek the sympathy and kindness of his faithful and much-enduring wife. There he gradually pined away until death put an end to his suffering in 1802.

The celebrated Flaxman gives the following account of some of Romney's best ideal pictures:—"Titania with her Indian Votaress" was arch and spightly; "Milton dictating to his Daughters," solemn and interesting. Several pictures of wood-nymphs and bacchants charmed by their rural beauty, innocence, and simplicity." (See Cunningham's *Lives of British Painters*, &c.)

ROMNEY, New, a cinque port, market-town, and decayed borough of England, in the county of Kent, in the middle of Romney Marsh, a wide, level tract of pasture-land, defended from the sea by an embankment, 31 miles S.E. by S. of Maidstone. There is a magnificent Norman church of the twelfth century, with a lofty and handsome square tower; also Wesleyan and Baptist places of worship, a market-house, town-hall, hospital, and assembly-room. Though now a mile and a half from the sea, it was once a considerable seaport. The borough was disfranchised by the Reform Act of 1832. Pop. (1851) 1053.

ROMORANTIN, a town of France, capital of an arrondissement, in the department of Loire-et-Cher, on the right bank of the Sauldre, an affluent of the Loire, 24 miles S.E. of Blois. It was once a very ill-built place, but has recently been much improved: the streets have been widened and straightened, and many new houses built. There are here an old castle, prison, courts of law, and a theatre. Cloth, leather, parchment, and other articles are made, and form the staple of an active trade. Romorantin was besieged in 1356; and cannons were used then, some say for the first time. Pop. (1856) 7863.

ROMSEY, or RUMSEY, a market-town and municipal borough of England, Hampshire, on the left bank of the Anton or Test, here crossed by a bridge, 10 miles S.W. of Winchester, and 73 S.W. of London. It consists principally of a broad street, crossed by another at right angles; and its most notable building is the parish church, which, from its cruciform plan, has something of a cathedral appearance. It is said to be a part of the abbey founded by the Saxon king Edward the Elder in the tenth century, and is interesting to the antiquary for its architecture and monuments. The other places of worship belong to Methodists, Independents, Baptists, and Sandemanians. There are several schools, a town-hall, audit-house, jail, alms-houses, &c. The manufactories include saw-mills, corn and paper mills, tanneries, breweries, &c.; and there is some trade in corn, timber, and coal. Pop. of the town (1851) 2080.

ROMULUS. See ROMAN HISTORY.

RONALDSHAY. See ORKNEY.

RONCIGLIONE, a town of the Papal States, in the delegation and 12 miles S.S.E. of Viterbo, occupies a romantic position on a rocky precipice overhanging a deep, wooded ravine, on the edge of the Campagna di Roma. Many of the streets and buildings are handsome; and there is a ruined Gothic castle and several ancient palaces, which are deserted and falling into decay. There are, however, flourishing iron-works and paper-mills. Pop. 4600.

RONDA, a town of Spain, Andalucia, in the province and 40 miles W. of Granada, and 48 N.N.E. of Gibraltar. It stands on a rock nearly surrounded by the Guadalvin, which flows through a deep chasm, separating the old from the new town, and spanned by two bridges, an old and a new, the latter 300 feet in length, crossing the chasm 600 feet above the water. Several cascades are formed by the stream, dashing out of the dark cleft through which it flowed, and sparkling with foam in the light of the sun. At the foot of the cliffs is a curious grotto, hewn out of the rock for the Moors by Christian slaves in 1342. At the

edge of the precipice is a rose-garnished *alameda*, or public walk, commanding a wide and beautiful prospect. The old part of the town has a Moorish aspect, with narrow, steep, and crooked lanes, and several old Moorish towers and other buildings; but the new town contains many broad, handsome streets and squares. The fine stone bull arena (Plaza de Torros) is one of the largest in Spain, and can contain 10,000 spectators. Besides churches and convents, there are among the public buildings a town-hall, an ill-arranged prison, and a large, old castle that protects the whole town. The last, however, is not now of any importance, and it was much injured by the French in 1812, when they occupied the town. Ronda is the seat of much traffic in leather, saddlery, and horses. It is a very gay place: an annual fair is held, and much smuggling is carried on. The climate is salubrious and favourable to longevity. Pop. 15,943.

RÖNNE, a town of Denmark, capital of the island of Bornholm, stands on its west coast, and has a fortified harbour, active trade, manufactures of clocks, and numerous potteries. Here are also a grammar school and an hospital. Many of the inhabitants are sailors or fishermen. Pop. 4000.

RONNEBURG, a town of Saxe-Altenburg, in the circle and 14 miles S.W. of Altenburg, stands on a height, and is walled and defended by two forts. It has a palace, Latin school, woollen factories, dye-works, and some trade in corn and wool. In the vicinity there are mineral baths. Pop. 5978.

RONSARD, PIERRE DE, a French poet, was born at the castle of Poissonnière in Vendômois in 1524. He was descended of a noble family, and was educated at Paris in the college of Navarre. Academical pursuits not suiting his genius, he left college, and became page to the Duke of Orleans, who resigned him to James Stuart, King of Scots. Ronsard continued in Scotland with the Scottish king upwards of two years, and afterwards went to France, where he was employed by the Duke of Orleans in several negotiations. He accompanied Lazare Baif to the Diet of Spire. Having from the conversation of this learned man imbibed a passion for the belles-lettres, he studied the Greek language with Baif's son under Daurat. It is reported of Ronsard that his practice was to study till two o'clock in the morning, and when he went to bed, to awaken Baif, who resumed his place. The Muses possessed in his eyes an infinity of charms; and he cultivated them with such success that he acquired the appellation of the "Prince of Poets" of his time. Henry II., Francis II., Charles IX., and Henry III. loaded him with favours. Having gained the first prize of the Jeux Floraux, they thought the reward promised below the merit of the work and the reputation of the poet. The city of Toulouse caused a Minerva of massy silver of considerable value to be made and sent to him. This present was accompanied with a decree, declaring him "The French Poet," by way of distinction. Ronsard afterwards made a present of his Minerva to Henry II., and this monarch appeared as much elated with this mark of the poet's esteem for him as the poet himself could have been had he received the present from his sovereign. Mary, the beautiful and unfortunate Queen of Scots, who was equally sensible of his merit with the Toulonese, gave him a rich set of table-plate.

He wrote hymns, odes, a poem called the *Franciade*, eclogues, epigrams, sonnets, &c. In his odes he takes bombast for poetic raptures. He wishes to imitate Pindar; and by labouring too much for lofty expressions, he loses himself in a cloud of words. He is obscure and harsh to the last degree; faults which he might easily have avoided by studying the works of Marot. But what could be expected from a man who had so little taste that he called Marot's works, "a dunghill, from which rich grains of gold, by industrious working, might be picked." He has, however, some pieces not destitute of real merit; and there

Rönn
||
Ronsard.

Roof. are perhaps few effusions of the French muse more truly poetical than his *Four Seasons of the Year*, where a most fertile imagination displays all its riches. Ronsard, though it is doubtful whether he ever was in orders, held several benefices. He died at Saint-Cosme-les-Tours, December 27, 1585, aged sixty-one years. He appeared more ridiculous as a man than as a poet; he was particularly vain, and his immoderate indulgence in pleasure served to hasten his old age. In his fiftieth year he was weak and valetudinary, and subject to attacks of the gout. He retained his wit, his vivacity, and his readiness at poetic composition to the

last. Ronsard's poems have been published in folio, in quarto, and in 10 volumes duodecimo, in 1567. The *Œuvres Choisies de Ronsard* were published at Paris in 1840.

Ronsdorf
||
Roof.

RONSDORF, a town of Prussia, in the province of the Rhine, and government of Düsseldorf, on the slope of a hill on the Morsbach, 17 miles E. of Düsseldorf. It has manufactures of cutlery, silk, linen, cotton, and woollen fabrics, ribands, &c. The town owes its origin to a religious sect in the eighteenth century. Pop. 7302.

ROOD, a piece of land equal to 40 square perches, or the fourth part of an acre.

ROOF.

Definition. **ROOF**, the covering of any building by which its inhabitants and contents are protected from the injuries and inclemencies of the weather. So essential is it, that the word is frequently used for the house itself. To "come under the roof" is a Hebrew phrase; and the word "tectum" had the same meaning among the Romans. It is derived from the Anglo-Saxon *hrof*, who thought so much of its importance, that they called the carpenter *hrof-wyrhta*, or the "roof-worker."

Varieties of covering. Roofs may be considered as to their covering, and the framing which carries such covering. The former is either of metal, as lead, copper, zinc, corrugated or galvanized iron, &c.; or of tile, either Italian, pan or Flemish tile, plain tile, &c.; or of slate, and sometimes of stone. The Greek temples were covered with long thin pieces of marble sunk or worked hollow by the mason, so that the wet could not run back under the next, and consequently these roofs shot off the water easily, and were very flat. Both in ancient and modern times, in all countries, the poorer classes of roofs are covered or thatched with straw, reed, heather, or some similar material. In most hot climates, and also in many parts of Italy, the roofs are flat, and covered with a sort of concrete or cement, which is carried on joists like a floor; the object being to form a sort of terrace to walk on early in the morning or late in the evening, to enjoy the cool air, which can only be felt in elevated situations.

Pitch. The elevation of a roof, which governs the angle its rafters make with the horizon, is called its pitch. On this subject there has been a great deal of controversy. Some have considered, as they find the farther we go south the flatter the roofs are, that the pitch must be governed by climate; and most elaborate calculations have been made of certain angles at which it is proposed that roofs should be constructed in various latitudes. But it should be remembered that in hot climates the rains come all at once; in such floods our roofs could not resist; and it would be poor economy, because for months together there were no rain, if, when it does come, the house should be daily drenched. Others have considered the whole a mere matter of taste, and the pitch is chosen as we wish more or less of a roof to be seen. The Greeks made their roofs very flat, and placed large antefixes along the eaves, so that the roof could not be seen from below except from a great distance. (See the restored view of the Parthenon, *ARCHITECTURE*, Plate L.) The angle is about 16°, the pitch or height at the apex being about a seventh of the width. Roman roofs average about 22°, or a fifth pitch. That the mediæval builders had no rule, is shown from the extreme variety of the height of roofs in their different edifices. In the Lombardic cathedral of Pisa, erected 1063 (*ARCHITECTURE*, Plate LXX.), the roof is about 27°, or nearly quarter pitch. The Norman roofs are seldom more than 40°, or less than half pitch; while in the early English period they suddenly sprung up to whole pitch,—i.e., the height equal to the entire width (see Beverley Minster, *ARCHITECTURE*, Plate LXVIII, fig. 1), being an angle of about 64°. They then

gradually were less in height till the perpendicular period, when many roofs were nearly flat; that of Henry the Seventh chapel, for example, being but about 16°, or as flat as a Greek roof. Now, that this variety was matter of taste,—we had almost said caprice,—is evidenced by this fact: these examples are all covered with lead (which might have been laid quite flat, and yet have been perfectly sound), and all have a stone groined roof below them, which has nothing whatever to do with the upper covering, and which, after all, is the real roof or cover which protects the building from the weather. Much has been said of the propriety of always showing the roof of a building, and the Gothic architects have been eulogised for so doing. The facts stated above, however, prove this was not always the case. We cannot, however, justify the going out of the way to conceal a roof by false attics, stilted balustrades, &c.; and the screen wall at St Paul's at London must always be considered a defect in that fine building. Still, a wide expanse of plain roof is as ugly in itself as a bare wall; and we cannot approve of such roofs as some of the modern imitations of early English work are, where the wall is so low that we could touch the eaves with a walking-stick, and there is three or four times as much roof as wall. The roof of a house has not inaptly been likened to a man's hat. There is no need to try and hide or disguise it if you are obliged to wear it; and if the weather is warm, and you do not require it, it would be folly to wear one without a crown. If on board ship, you would wear as low a hat as possible to avoid striking it against the beams; but, above all, it should bear some reasonable proportion to the height of a man, as the roof should to the wall. It would be absurd to wear a hat as tall as the man himself.

After all, although much latitude must be given to taste, it is probable the pitch of a roof mainly depends on the material with which it is covered. The largest number of buildings are erected with a view to utility and strict economy, and without any regard to æsthetics. Everybody knows that if slates or tiles are laid at too flat a pitch, the wind will drive the rain up under them, and the roof will leak; and everybody also knows that if the same covering be taken off and re-laid to a steeper pitch, the roof will be sound. Practice teaches what is the safe minimum pitch. Let us suppose it to be quarter pitch, and for considerations of taste we make it three-quarter pitch. Now, it is quite clear we waste not only the rafters and covering, but our whole roof must be constructed of stronger timbers, and our walls also must be thicker and stronger, inasmuch as they have more weight to bear. We therefore pay dear in more ways than one for our liking for high-pitched roofs.

Although it happens that both Greek, Roman, and Italian roofs are flatter than ours, and the climate is warmer, the same material used in our climates would answer perfectly well. An inspection of the elaborate plate 97, in the *Architettura Antica Greca* of the celebrated Canina will show this; and the frequent failure in our climate of Italian

Pitch dependent on materials used.

Roof.

tiles (which are exactly like the ancient Roman) arises from the fact, that the tegole and imbrici only have been used, our builders being ignorant of the use of the mattoni, which in Italy are a very essential part of the soundness of those roofs. In one respect climate must be considered, and that is, where there are long winters, and the snow is likely to lie on them; in this case they should be sharper in pitch, and stronger in framing.

Pitch required for different materials.

If covered with lead or other metals, roofs may be made nearly flat, with only so much fall, in fact, as to prevent the water flowing back under the drips. (See BUILDING, PLUMBERS' WORK, &c.) Italian tiles, to be sound, should have a fifth pitch, or 22°. Slates with extra lap may be laid at quarter pitch, about 27°, if it be necessary the roof should be flat; a third pitch (34°) is rather too much: the mean between a third and fourth (31°) is a good rule. Pantiles should be laid rather sharper still, and plain tiles from about 35° to 40°; but of course very much will depend on the gauge they are laid to, or the length of the part of the slate or tile which overlaps the other, as the larger this lap is, the less likely the rain is to drive under. Thatched roofs should be somewhat sharper in pitch than plain tiles.

Qualities of various roof coverings.

Lead or copper, in an economical point of view, are the best materials for roofs. They may be laid nearly flat, and so save all the framing and roof timbers; and the metal, should it be worn into holes, is nearly as valuable as when first laid down; the only objection is, that the first expense is so great. Zinc, though very cheap and light, and though it can be laid flat, is apt to go into holes with the action of acids. Slating is both light and very cheap, and will lie at a flat pitch; and consequently requires much lighter walls and timbers than tiles. It will not decay with the weather. It is apt to break under the feet; and if not very well done will lift with heavy winds. Each slate should be nailed with two copper nails, as iron rusts and breaks them. (See BUILDING, SLATING, &c.) Pan-tiles are dearer than slates, but not much heavier; they also break if trodden on, and the snow will drift under if the pointing comes out. Plain tiles are very durable, but they require a steep pitch, and are very heavy: thus in two ways distressing the walls and the roof timbers.

Weight of different roof coverings.

This also depends on the gauge; but the following may be taken as the ordinary average:—

A square (100 feet superficial, or 11 yards superficial nearly) of zinc will weigh about...	1 cwt.
A square of lead, according to thickness, from...	5 to 7 "
A square of slating from.....	5½ to 7½ "
A square of pan-tiling.....	7½ "
A square of plain tiling.....	14 to 16 "

All roofs, till very lately, except some which have been arched or domed, were framed with timber; no other material being known at that time which possessed such lengths with such qualities of tension. Later years, however, and more extended requirements, have developed the advantages of the use of iron. As everything must depend on the soundness of both design and execution of framing, whether in wood or iron, it is proposed to divide this subject, one of the most important in architecture, into the following sections:—

I. *Theory of Roof* will comprehend the whole of the scientific part of the celebrated essay of Professor Robison, which was originally written for this work, and which is acknowledged to be the best yet given to the public.

II. *Causes of Failure of Roofs*, given in terms that are intelligible to those unacquainted with the higher branches of mathematical analysis.

III. *Mediæval Roofs*.

IV. *Account of Roofs of great span (à grande portée).*

—1. Those trussed with straight timbers (*en bois plat*).

2. Those trussed with curved timbers—*a*, With timbers side by side, breaking joint (*système en planches*

de champ); *b*, Those bent in thickness (*courbes sur leur plat*).

V. *Roofs constructed of Iron*.

Roof.

The late Professor Robison's Theory of Roof.

We shall attempt in this article to give an account of the Purpose of leading principles of this art, in a manner so familiar and this article. palpable, that any person who knows the common properties of the lever, and the composition of motion, shall so far understand them as to be able, on every occasion, so to dispose his materials, with respect to the strains to which they are to be exposed, that he shall always know the effective strain on every piece, and shall, in most cases, be able to make the disposition such as to derive the greatest possible advantage from the materials which he employs.

It is evident that the whole must depend on the principles which regulate the strength of the materials, relative to the manner in which this strength is exerted, and the manner in which the strain is laid on the piece of matter. With respect to the first, this is not the proper place for considering it, and we must refer the reader to the article **STRENGTH OF MATERIALS IN MECHANICS**. We shall just borrow from that article two or three propositions suited to our purpose.

The force with which the materials of our edifices, roofs, floors, machines, and framings of every kind, resist being broken or crushed, or pulled asunder, is immediately or ultimately the cohesion of their particles. When a weight hangs by a rope, it tends either immediately to break all the fibres, overcoming the cohesion amongst the particles of each, or it tends to pull one parcel of them from amongst the rest, with which they are joined. This union of the fibres is brought about by some kind of gluten, or by twisting, which causes them to bind each other so hard that any one will break rather than come out, so much is it withheld by friction. The ultimate resistance is therefore the cohesion of the fibre; and the force or strength of all fibrous materials, such as timber, is exerted in much the same manner. The fibres are either broken or pulled out from among the rest. Metals, stone, glass, and the like, resist being pulled asunder by the simple cohesion of their parts.

The force which is necessary for breaking a rope or wire is a proper measure of its strength. In like manner, the force necessary for tearing directly asunder any rod of wood or metal, breaking all its fibres, or tearing them from amongst each other, is a proper measure of the united strength of all these fibres; and it is the simplest strain to which they can be exposed, being just equal to the sum of the forces necessary for breaking or disengaging each fibre. And, if the body is not of a fibrous structure, which is the case with metals, stones, glass, and many other substances, this force is still equal to the simple sum of the cohesive forces of each particle which is separated by the fracture. Let us distinguish this mode of exertion of the cohesion of the body by the name of its *absolute strength*.

When solid bodies are, on the contrary, exposed to great compression, they can resist only a certain degree. A piece of clay or lead will be squeezed out; a piece of freestone will be crushed to powder; a beam of wood will be crippled, swelling out in the middle, and its fibres lose their mutual cohesion, after which it is easily crushed by the load. A notion may be formed of the manner in which these strains are resisted, by conceiving a cylindrical pipe filled with small shot, well shaken together, so that each sphericle is lying in the closest manner possible, that is, in contact with six others in the same vertical plane, this being the position in which the shot will take the least room. Thus each touches the rest in six points. Now suppose them all united, in these six points only, by some cement. This assemblage will stick together and form a

Roof. cylindrical pillar, which may be taken out of its mould. Now suppose this pillar standing upright, and loaded above. The supports arising from the cement act obliquely, and the load tends either to force them asunder laterally, or to make them slide on each other: either of these things happening, the whole is crushed to pieces. The resistance of fibrous materials to such a strain is a little more intricate, but may be explained in a way very similar.

A piece of matter of any kind may also be destroyed by wrenching or twisting it. We can easily form a notion of its resistance to this kind of strain by considering what would happen to the cylinder of small shot if treated in this way.

And, lastly, a beam, or a bar of metal, or piece of stone or other matter, may be broken transversely. This will happen to a rafter or joist supported at the ends when overloaded, or to a beam having one end stuck fast in a wall and a load laid on its projecting part. This is the strain to which materials are most commonly exposed in roofs; and, unfortunately, it is the strain which they are the least able to bear; or rather it is the manner of application which causes an external force to excite the greatest possible immediate strain on the particles. It is against this that the carpenter must chiefly guard, avoiding it when in his power, and in every case diminishing it as much as possible. It is necessary to give the reader a clear notion of the great weakness of materials in relation to this transverse strain. But we shall do nothing more, referring him to the articles STRAIN, and STRESS, and STRENGTH.

Let ABCD (fig. 1) represent the side of a beam projecting horizontally from a wall in which it is firmly fixed, and let it be loaded with a weight W appended to its extremity. This tends to break it; and the least reflection will convince any person, that if the beam is equally strong throughout, it will break in the line CD, even with the surface of the wall. It will open at D, while C will serve as a sort of joint, round which it will turn. The cross section through the line CD is for this reason called the *section of fracture*; and the horizontal line drawn through C on its under surface is called the *axis of fracture*. The fracture is made by tearing asunder the fibres, such as DE or FG. Let us suppose a real joint at C, and that the beam is really sawed through along CD, and that in place of its natural fibres, threads are substituted all over the section of fracture. The weight now tends to break these threads, and it is our business to find the force necessary for this purpose.

It is evident that DCA may be considered as a bended lever, of which C is the fulcrum. If f be the force which will just balance the cohesion of a thread when hung on it so that the smallest addition will break it, we may find the weight which will be sufficient for this purpose when hung on at A, by saying, $AC : CD :: f : \phi$, and ϕ will be the weight which will just break the thread, by hanging ϕ by

the point A. This gives us $\phi = f \times \frac{CD}{CA}$. If the weight be hung on at a , the force just sufficient for breaking the same thread will be $= f \times \frac{CD}{Ca}$. In like manner, the force ϕ , which must be hung on at A in order to break an equally

strong or an equally resisting fibre at F, must be $= f \times \frac{CF}{CA}$.

And so on of all the rest.

If we suppose all the fibres to exert equal resistances at the instant of fracture, we know, from the simplest elements of mechanics, that the resistance of all the particles in the line CD, each acting equally in its own place, is the same as if all the individual resistances were united in the middle point g . Now this total resistance is the resistance or strength f of each particle, multiplied by the number of particles. This number may be expressed by the line CD, because we have no reason to suppose that they are at unequal distances. Therefore, in comparing different sections together, the number of particles in each are as the sections themselves. Therefore DC may represent the number of particles in the line DC. Let us call this line the depth of the beam, and express it by the symbol d . And since we are at present treating of roofs whose rafters and other parts are commonly of uniform breadth, let us call AH or BI the breadth of the beam, and express it by b , and let CA be called its length l . We may now express the strength of the whole line CD by $f \times d$, and we may suppose it all concentrated in the middle point g . Its mechanical energy, therefore, by which it resists the energy of the weight w , applied at the distance l , is $f \times CD \times Cg$, whilst the momentum of w is $w \times CA$. We must therefore have $f \times CD \times Cg = w \times CA$, or $fd \times \frac{1}{2}d = wl$, and $fd : w :: l : \frac{1}{2}d$, or $fd : w :: 2l : d$. That is, twice the length of the beam is to its depth as the absolute strength of one of its vertical planes to its relative strength, or its power of resisting this transverse fracture.

It is evident, that what has been now demonstrated of the resistance exerted in the line CD, is equally true of every line parallel to CD in the thickness or breadth of the beam. The absolute strength of the whole section of fracture is represented by fdb , and we still have $2l : d :: fdb : w$; or twice the length of the beam is to its depth as the absolute strength to the relative strength. Suppose the beam twelve feet long and one foot deep; then whatever be its absolute strength, the twenty-fourth part of this will break it if hung at its extremity.

But even this is too favourable a statement. All the fibres are supposed to act alike in the instant of fracture. But this is not true. At the instant that the fibre at D breaks, it is stretched to the utmost, and is exerting its whole force. But at this instant the fibre at g is not so much stretched, and it is not then exerting its utmost force. If we suppose the extension of the fibres to be as their distance from C, and the actual exertion of each to be as their extensions, it may easily be shown (see STRENGTH and STRAIN), that the whole resistance is the same as if the full force of all the fibres were united at a point r distant from C by one third of CD. In this case we must say, that the absolute strength is to the relative strength as three times the length to the depth; so that the beam is weaker than by the former statement in the proportion of two to three.

Even this is more strength than experiment justifies, and we can see an evident reason for it. When the beam is strained, not only are the upper fibres stretched, but the lower fibres are compressed. This is very distinctly seen, if we attempt to break a piece of cork cut into the shape of a beam. This being the case, C is not the centre of fracture. There is some point c which lies between the fibres which are stretched and those that are compressed. This fibre is neither stretched nor squeezed, and this point is the real centre of fracture; and the lever by which a fibre D resists, is not DC, but a shorter one Dc, and the energy of the whole resistances must be less than by the second statement. Till we know the proportion between the dilatibility and compressibility of the parts, and the relation

Fig. 1.

Roof. between the dilatations of the fibres and the resistances which they exert in this state of dilatation, we cannot positively say where the point is situated, nor what is the sum of the actual resistances, or the point where their action may be supposed concentrated. The firmer woods, such as oak and chestnut, may be supposed to be but slightly compressible; we know that willow and other soft woods are very compressible. These last must therefore be weaker; for it is evident, that the fibres which are in a state of compression do not resist the fracture. It is well known, that a beam of willow may be cut through from C to *g* without weakening it in the least, if the cut be filled up by a wedge of hard wood stuck in.

We can only say, that very sound oak and red fir have the centre of effort so situated, that the absolute strength is to the relative strength in a proportion of not less than that of three and a half times the length of the beam to its depth. A square inch of sound oak will carry about 8000 pounds. If this bar be firmly fixed in a wall, and project twelve inches, and be loaded at the extremity with 200 pounds, it will be broken. It will just bear 190, its relative strength being $\frac{1}{40}$ of its absolute strength; and this is the case only with the finest pieces, so placed that their annual plates or layers are in a vertical position. A larger log is not so strong transversely, because its plates lie in various directions round the heart.

Practical inferences. These observations are enough to give us a distinct notion of the vast diminution of the strength of timber when the strain is across it; and we see the justice of the maxim which we inculcated, that the carpenter, in framing roofs, should avoid as much as possible the exposing his timbers to transverse strains. But this cannot be avoided in all cases. Nay, the ultimate strain arising from the very nature of a roof is transverse. The rafters must carry their own weight, and this tends to break them across. An oak beam a foot deep will not carry its own weight if it project more than sixty feet. Besides this, the rafters must carry the lead, tiling, or slates. We must therefore consider this transverse strain a little more particularly, so as to know what strain will be laid on any part by an unavoidable load, imposed either at that part or at any other.

Effect when beams are supported at the ends and loaded in the middle. We have hitherto supposed, that the beam had one of its ends fixed in a wall, and that it was loaded at the other end. This is not an usual arrangement, and was taken merely as affording a simple application of the mechanical principles. It is much more usual to have the beam supported at the ends, and loaded in the middle. Let the beam FE^gH (fig. 2) rest on the props E and G, and be loaded at its middle point C with a weight W. It is required to determine the strain at the section CD. It is plain that the beam will receive the same support, and suffer the same strain, if, instead of the blocks E and G, we substitute the ropes Ff, Hh, going over the pulleys f and g, and loaded with proper weights *e* and *g*. The weight *e* is equal to the support given by the block E; and *g* is equal to the support given by G. The sum of *e* and *g* is equal to W; and on whatever point W is hung, the weights *e* and *g* are to W in the proportion of DG and DE to GE. Now, in this state of things, it appears that the strain on the section CD arises immediately from the upward action of the ropes Ff and Hh, or the upward pressures of the blocks E and G; and that the office of the weight W is to oblige the beam to oppose this strain. Things are in the same state in respect of strain as if a block were substituted at D for the weight W, and the weights *e* and *g* were

Fig. 2.

hung on at E and G, only the directions will be opposite. The beam tends to break in the section CD, because the ropes pull it upwards at E and G, whilst a weight W holds it down at C. It tends to open at D, and C becomes the centre of fracture. The strain therefore is the same as if the half ED were fixed in the wall, and a weight equal to *g*, that is, to the half of W, were hung on at G.

Hence we conclude, that a beam supported at both ends, but not fixed there, and loaded in the middle, will carry four times as much weight as it can carry at its extremity, when the other extremity is fast in a wall.

The strain occasioned at any point L by a weight W, hung on at any other point D, is $= W \times \frac{DE}{EG} \times LG$. For

EG is to ED as W to the pressure occasioned at G. This would be balanced by some weight *g* acting over the pulley h; and this tends to break the beam at L, by acting

on the lever GL. The pressure at G is $W \times \frac{DE}{EG}$, and therefore the strain at L is $W \times \frac{DE}{EG} \times LG$.

In like manner, the strain occasioned at the point D by the weight W hung on there, is $W \times \frac{DE}{EG} \times DG$; which is therefore equal to $\frac{1}{2} W$ when D is the middle point.

Hence we see that the general strain on the beam arising from one weight, is proportional to the rectangle of the parts of the beam (for $\frac{W \times DE \times DG}{EG}$ is as $DE \times DG$), and is greatest when the load is laid on the middle of the beam.

We also see, that the strain at I, by a load at D, is equal to the strain at D by the same load at L. And the strain at L from a load at D is to the strain by the same load at L as DE to LE. These are all very obvious corollaries, and they sufficiently inform us concerning the strains which are produced on any part of the timber by a load laid on any other part.

If we now suppose the beam to be fixed at the two ends, that is, firmly framed or held down by blocks at I and K, placed beyond E and G, or framed into posts, it will carry twice as much as when its ends were free. For suppose it sawn through at CD, the weight W hung on there will be just sufficient to break it at E and G. Now restore the connection of the section CD, it will require another weight W to break it there at the same time.

Therefore, when a rafter, or any piece of timber, is firmly connected with three fixed points, G, E, I, it will bear a greater load between any two of them than if its connection with the remote point were removed; and if it be fastened in four points, G, E, I, K, it will be twice as strong in the middle part as without the two remote connections.

One is apt to expect from this that the joist of a floor will be much strengthened by being firmly built in the wall. It is a little strengthened; but the hold which can thus be given to it is much too short to be of any sensible service, and it tends greatly to shatter the wall, because, when it is bent down by a load, it forces up the wall with a momentum of a long lever. Judicious builders therefore take care not to bind the joists tight in the wall. But when the joists of adjoining rooms lie in the same direction, it is a great advantage to make them of one piece. They are then twice as strong as when made in two lengths.

It is easy to deduce from these premises the strain on any point which arises from the weight of the beam itself, or from any load which is uniformly diffused over the whole or any part. We may always consider the whole of the

Roof.

Roof. weight which is thus uniformly diffused over any part as united in the middle point of that part; and if the load is not uniformly diffused, we may still suppose it united at its centre of gravity. Thus, to know the strain at D arising from the weight of the whole beam, we may suppose the whole weight accumulated in its middle point D. Also the strain at L, arising from the weight of the part ED, is the same as if this weight were accumulated in the middle point d of ED; and it is the same as if half the weight of ED were hung on at D. For the real strain at L is the upward pressure at G, acting by the lever GL. Now, calling the weight of the part DE e , this upward pressure will be $\frac{e \times dE}{EG}$, or $\frac{\frac{1}{2}e \times DE}{EG}$.

Therefore the strain on the middle of a beam, arising from its own weight, or from any uniform load, is the weight of the beam or its load $\times \frac{ED}{EG} \times DG$; that is, half the weight of the beam or load multiplied or acting by the lever DG; for $\frac{ED}{EG}$ is $\frac{1}{2}$.

Also the strain at L, arising from the weight of the beam, or the uniform load, is $\frac{1}{2}$ the weight of the beam or load acting by the lever LG. It is therefore proportional to LG, and is greatest of all at D. Therefore a beam of uniform strength throughout, uniformly loaded, will break in the middle.

Relation between the weight or strains and the relative strength.

It is of importance to know the relation between the strains arising from the weights of the beams, or from any uniformly diffused load, and the relative strength. We have

already seen, that the relative strength is $\int \frac{dbd}{ml}$, where m is a number to be discovered by experiment for every different species of materials. Leaving out every circumstance but what depends on the dimensions of the beam, viz. d , b , and l , we see that the relative strength is in the proportion of $\frac{d^2b}{l}$, that is, as the breadth and the square of the depth directly, and the length inversely.

Now, to consider, first, the strain arising from the weight of the beam itself, it is evident that this weight increases in the same proportion with the depth, the breadth, and the length of the beam. Therefore its power of resisting this strain must be as its depth directly, and the square of its length inversely. To consider this in a more popular manner, it is plain that the increase of breadth makes no change in the power of resisting the actual strain, because the load and the absolute strength increase in the same proportion with the breadth. But, by increasing the depth, we increase the resisting section in the same proportion, and therefore the number of resisting fibres and the absolute strength; but we also increase the weight in the same proportion. This makes a compensation, and the relative strength is yet the same. But, by increasing the depth, we have not only increased the absolute strength, but also its mechanical energy. For the resistance to fracture is the same as if the full strength of each fibre was exerted at the point which we called the centre of effort; and we showed that the distance of this from the under side of the beam was a certain portion (a half, a third, a fourth, &c.) of the whole depth of the beam. This distance is the arm of the lever, by which the cohesion of the wood may be supposed to act. Therefore this arm of the lever, and consequently the energy of the resistance, increases in the proportion of the depth of the beam, and this remains uncompensated by any increase of the strain. On the whole, therefore, the power of the beam to sustain its own weight increases in the proportion of its depth. But, on the other

VOL. XIX.

hand, the power of withstanding a given strain applied at its extremity, or to any aliquot part of its length, is diminished as the length increases, or is inversely as the length; and the strain arising from the weight of the beam also increases as the length. Therefore the power of resisting the strain actually exerted on it by the weight of the beam is inversely as the square of the length. On the whole, therefore, the power of a beam to carry its own weight varies in the proportion of its depth directly and the square of its length inversely.

As this strain is frequently a considerable part of the whole, it is proper to consider it apart, and then to reckon only on what remains for the support of any extraneous load.

In the next place, the power of a beam to carry any load which is uniformly diffused over its length, must be inversely as the square of the length; for the power of withstanding any strain applied to an aliquot part of the length (which is the case here, because the load may be conceived as accumulated at its centre of gravity, the middle point of the beam) is inversely as the length; and the actual strain is as the length, and therefore its momentum is as the square of the length. Therefore the power of a beam to carry a weight uniformly diffused over it, is inversely as the square of the length.

It is here understood, that the uniform load is of some determined quantity for every foot of the length, so that a beam of double length carries a double load.

We have hitherto supposed that the forces which tend to break a beam transversely are acting in a direction perpendicular to the beam. This is always the case in level floors loaded in any manner; but in roofs, the action of the load tending to break the rafters is oblique, because gravity always acts in vertical lines. It may also frequently happen, that a beam is strained by a force acting obliquely. This modification of the strain is easily discussed. Suppose that the external force, which is measured by the weight W in fig. 1, acts in the direction Aw' instead of AW . Draw Ca' perpendicular to Aw . Then the momentum of this external force is not to be measured by $W \times AC$, but by $W \times a'C$. The strain therefore by which the fibres in the section of fracture DC are torn asunder, is diminished in the proportion of CA to Ca' , that is, in the proportion of radius to the sine of the angle CAa' , which the beam makes with the direction of the external force.

To apply this to our purpose in the most familiar manner, let AB (fig. 3) be an oblique rafter of a building, loaded with a weight W suspended to any point C , and thereby occasioning a strain in some part D . We have already seen, that the immediate cause of the strain on D is the re-action of the support which is given to the point B . The rafter may at present be considered as a lever, supported at A , and pulled down by the line CW . This occasions a pressure on B , and the support acts in the opposite direction to the action of the lever, that is, in the direction Bb , perpendicular to BA . This tends to break the beam in every part. The pressure exerted at B is $\frac{W \times AE}{AB}$, AE being a horizontal line. There-

Fig. 3.

fore the strain at D will be $\frac{W \times AE}{AB} \times BD$. Had the beam been lying horizontally, the strain at D , from the weight W suspended at C , would have been $\frac{W \times AC}{AB} \times BD$.

Root.

It is therefore diminished in the proportion of AC to AE, that is, in the proportion of radius to the cosine of the elevation, or in the proportion of the secant of elevation to the radius.

It is evident, that this law of diminution of the strain is the same whether the strain arises from a load on any part of the rafter, or from the weight of the rafter itself, or from any load uniformly diffused over its length, provided only that these loads act in vertical lines.

Strength of roofs having different elevations compared.

We can now compare the strength of roofs which have different elevations. Supposing the width of the building to be given, and that the weight of a square yard of covering is also given. Then, because the load on the rafter will increase in the same proportion with its length, the load on the slant-side BA of the roof will be to the load of a similar covering on the half AF of the flat roof, of the same width, as AB to AF. But the transverse action of any load on AB, by which it tends to break it, is to that of the same load on AF as AF to AB. The transverse strain therefore is the same on both, the increase of real load on AB being compensated by the obliquity of its action. But the strengths of beams to resist equal strains, applied to similar points, or uniformly diffused over them, are inversely as their lengths, because the momentum or energy of the strain is proportional to the length. Therefore the power of AB to withstand the strain to which it is really exposed, is to the power of AF to resist its strain as AF to AB. If, therefore, a rafter AG of a certain scantling is just able to carry the roofing laid on it, a rafter AB of the same scantling, but more elevated, will be too weak in the proportion of AG to AB. Therefore steeper roofs require stouter rafters, in order that they may be equally able to carry a roofing of equal weight per square yard. To be equally strong, they must be made broader, or placed nearer to each other, in the proportion of their greater length, or they must be made deeper in the subduplicate proportion of their length. The following easy construction will enable the artist not familiar with computation to proportion the depth of the rafter to the slope of the roof.

Let the horizontal line af (fig. 4) be the proper depth of a beam whose length is half the width of the building; that is, such as would make it fit for carrying the intended tiling laid on a flat roof. Draw the vertical line fb , and the line ab having the elevation of the rafter; make ag equal to af , and describe the semicircle bdg ; draw ad perpendicular to ab , then ad is the required depth. The demonstration is evident.

Fig. 4.

We have now treated in sufficient detail what relates to the chief strain on the component parts of a roof, namely, what tends to break them transversely; and we have enlarged more on the subject than what the present occasion indispensably required, because the propositions which we have demonstrated are equally applicable to all framings of carpentry, and are even of greater moment in many cases, particularly in the construction of machines. These consist of levers in various forms, which are strained transversely; and similar strains frequently occur in many of the supporting and connecting parts. We shall give, in another article, an account of the experiments which have been made by different naturalists, in order to ascertain the absolute strength of some of the materials which are most generally framed together in buildings and engines. The house-carpenter will derive from them absolute numbers, which he can apply to his particular purposes by means of the propositions which we have now established.

We proceed, in the next place, to consider the other

strains to which the parts of roofs are exposed, in consequence of the support which they mutually give each other, and the pressures, or *thrusts*, as they are called in the language of the house-carpenter, which they exert on each other, and on the walls or piers of the building.

Let a beam or piece of timber AB (fig. 5) be suspended by two lines AC, BD; or let it be supported by two props AE, BF, which are perfectly moveable round their remote extremities E, F, or let it rest on the two polished planes KAH, LBM. Moreover, let G be the centre of gravity of the beam, and let GN be a line through the centre of gravity perpendicular to the horizon. The beam will not be in equilibrium unless the vertical line GN either passes through P, the point in which the directions of the

Effect of other strains, &c.

Fig. 5.

Fig. 6.

two lines AC, BD, or the directions of the two props EA, FB, or the perpendiculars to the two planes KAH, LBM intersect each other, or is parallel to these directions. For the supports given by the lines or props are unquestionably exerted in the direction of their lengths, and it is well known in mechanics that the supports given by planes are exerted in a direction perpendicular to those planes in the points of contact; and we know that the weight of the beam acts in the same manner as if it were all accumulated in its centre of gravity G, and that it acts in the direction GN perpendicular to the horizon. Moreover, when a body is in equilibrium between three forces, they are acting in one plane, and their directions are either parallel or they pass through one point.

The support given to the beam is therefore the same as if it were suspended by two lines which are attached to the single point P. We may also infer, that the points of suspension C, D, the points of support E, F, the points of contact A, B, and the centre of gravity G, are all in one vertical plane.

When this position of the beam is disturbed by any external force, there must either be a motion of the points A and B round the centres of suspension C and D, or of the props round these points of support E and F, or a sliding of the ends of the beam along the polished planes KAH and LBM; and in consequence of these motions the centre of gravity G will go out of its place, and the vertical line GN will no longer pass through the point where the directions of the supports intersect each other. If the centre of gravity rises by this motion, the body will have a tendency to recover its former position, and it will require force to keep it away from it. In this case the equilibrium may be said to be *stable*, or the body to have *stability*. But if the centre of gravity descends when the body is moved from the position of equilibrium, it will tend to move still farther; and so far will it be from recovering its former position, that it will now fall. This equilibrium may be called a *tottering equilibrium*. These accidents depend on the situations of the points A, B, C, D, E, F; and they may be determined by considering the subject geometrically. It does not much interest us at present; it is rarely that the equilibrium of suspension is tottering, or that of props is stable. It is evident, that if the beam were suspended by lines from the point P, it would have stability, for it would swing like a pendulum round P, and therefore would always tend towards the position of equilibrium. The intersection of the lines of support would still be at P, and the vertical line

Roof.

drawn through the centre of gravity, when in any other situation, would be on that side of P towards which this centre has been moved. Therefore, by the rules of pendulous bodies, it tends to come back. This would be more remarkably the case if the points of suspension C and D were on the same side of the point P with the points of attachment A and B; for in this case the new point of intersection of the lines of support would shift to the opposite side, and be still further from the vertical line through the new position of the centre of gravity. But if the points of suspension and of attachment are on opposite sides of P, the new point of intersection may shift to the same side with the centre of gravity, and lie beyond the vertical line. In this case the equilibrium is tottering. It is easy to perceive, too, that if the equilibrium of suspension from the points C and D be stable, the equilibrium on the props AE and BF must be tottering. It is not necessary for our present purpose to engage more particularly in this discussion.

It is plain that, with respect to the mere momentary equilibrium, there is no difference in the support by threads, props, or planes, and we may substitute the one for the other. We shall find this substitution extremely useful, because we easily conceive distinct notions of the support of a body by strings.

Observe farther, that if the whole figure be inverted, and strings be substituted for props, and props for strings, the equilibrium will still obtain. For by comparing fig. 5 with fig. 6, we see that the vertical line through the centre of gravity will pass through the intersection of the two strings or props; and this is all that is necessary for the equilibrium; only it must be observed in the substitution of props for threads, and of threads for props, that if it be done without inverting the whole figure, a stable equilibrium becomes a tottering one, and *vice versa*.

Examples.

This is a most useful proposition, especially to the unlettered artisan, and enables him to make a practical use of problems which the greatest mechanical geniuses have found it no easy task to solve. An instance will show the extent and utility of it. Suppose it were required to make a mansard or kirk roof whose width is AB (fig. 7), and consisting of the four equal rafters AC, CD, DE, EB. There can be no doubt but that its best form is that which will put all the parts in equilibrio, so that no ties or stays may be necessary for opposing the unbalanced thrust of any part of it. Make a chain *acdeb* (fig. 8) of four equal pieces, loosely connected by pin-joints, round which the parts are perfectly moveable. Suspend this from two pins *a, b*, fixed in a horizontal line. This chain or festoon will arrange itself in such a form that its parts are in equilibrio. Then we know that if the figure be inverted, it will compose the frame or truss of a kirk-roof *aγδεβ*, which is also in equilibrio, the thrusts of the pieces balancing each other in the same manner that the mutual pulls of the hanging festoon *acdeb* did. If the proportion of the height *df* to the width *ab* is not such as pleases, let the pins *a, b* be placed nearer or more distant, till a proportion between the width and height is obtained which pleases, and then make

Fig. 7.

Fig. 8.

the figure ACDEB, fig. 7, similar to it. It is evident that this proposition will apply in the same manner to the determination of the form of an arch of a bridge; but this is not a proper place for a further discussion.

We are now enabled to compute all the thrusts and other pressures which are exerted by the parts of a roof on each other and on the walls. Let AB (fig. 9) be a beam standing anyhow obliquely, and G its centre of gravity. Let us suppose that the ends of it are supported in any directions AC, BD, by strings, props, or planes. Let these directions meet in the point P of the vertical line PG passing through its centre of gravity. Through G draw lines Ga, Gb parallel to PB, PA. Then

The weight of the beam }
The pressure or thrust at A } is proportional to $\begin{cases} PG \\ Pa \\ Pb. \end{cases}$
And the pressure at B

For when a body is in equilibrio between three forces, these forces are proportional to the sides of a triangle which have their directions.

In like manner, if A g be drawn parallel to P b, we shall have

Weight of the beam }
Thrust on A } proportional to $\begin{cases} Pg \\ PA \\ Ag \end{cases}$
And thrust on B

Or, drawing Bγ parallel to Pa,

Weight of the beam }
Thrust at A } proportional to $\begin{cases} Pγ \\ Bγ \\ PB. \end{cases}$
And thrust at B

It cannot be disputed that, if strength alone be considered, the proper form of a roof is that which puts the whole in equilibrio, so that it would remain in that shape although all the joints were perfectly loose or flexible. If it has any other shape, additional ties or braces are necessary for preserving it, and the parts are unnecessarily strained.

When this equilibrium is obtained, the rafters which compose the roof are all acting on each other in the direction of their lengths; and by this action, combined with their weights, they sustain no strain but that of compression, the strain of all others that they are the most able to resist. We may consider them as so many inflexible lines having their weights accumulated in their centres of gravity. But it will allow an easier investigation of the subject, if we suppose the weights to be at the joints, equal to the real vertical pressures which are exerted on these points.

These are very easily computed; for it is plain, that the weight of the beam AB (fig. 9) is to the part of this weight that is supported at B as AB to AG. Therefore, if W represent the weight of the beam, the vertical pressure at

B will be $W \times \frac{AG}{AB}$, and the vertical pressure at A will be

$W \times \frac{BG}{AB}$. In like manner, the prop BF being considered

as another beam, and f as its centre of gravity and w as its weight, a part of this weight, equal to $w \times \frac{fF}{BF}$, is supported

at B, and the whole vertical pressure at B is $W \times \frac{AG}{AB}$

+ $w \times \frac{fF}{BF}$. And thus we greatly simplify the consideration of the mutual thrusts of roof frames. We need hard-

Fig. 9.

Roof.

Roof.

ly observe, that although these pressures by which the parts of a frame support each other in opposition to the vertical action of gravity, are always exerted in the direction of the pieces, they may be resolved into pressures acting in any other direction which may engage our attention.

All that we propose to deliver on this subject at present may be included in the following proposition.

Let ABCDE (fig. 10) be an assemblage of rafters in a

Fig. 10.

vertical plane, resting on two fixed points A and E in a horizontal line, and perfectly moveable round all the joints A, B, C, D, E; let it be further supposed to be in equilibrio, and let us investigate what adjustment of the different circumstances of weight and inclination of its different parts is necessary for producing this equilibrium.

Let F, G, H, I, be the centres of gravity of the different rafters, and let these letters express the weights of each. Then, by what has been said above, the weight which presses B directly downwards is $F \times \frac{AF}{AB} + G \times \frac{CG}{BC}$.

The weight on C is in like manner $G \times \frac{BG}{BC} + D \times \frac{DH}{CD}$,

and that on D is $H \times \frac{CH}{CD} + I \times \frac{EI}{DE}$.

Let $A\bar{b}c\bar{d}E$ be the figure ABCDE inverted, in the manner already described. It may be conceived as a thread fastened at A and E, and loaded at \bar{b} , \bar{c} , and \bar{d} with the weights which are really pressing on B, C, and D. It will arrange itself into such a form that all will be in equilibrio. We may discover this form by means of this single consideration, that any part \bar{bc} of the thread is equally stretched throughout in the direction of its length. Let us therefore investigate the proportion between the weight β , which we suppose to be pulling the point \bar{b} in the vertical direction $\bar{b}\beta$, to the weight δ , which is pulling down the point \bar{d} in a similar manner. It is evident, that since AE is a horizontal line, and the figures $A\bar{b}c\bar{d}E$ and ABCDE equal and similar, the lines $B\bar{b}$, $C\bar{c}$, $D\bar{d}$, are vertical. Take $\bar{b}\bar{f}$ to represent the weight hanging at \bar{b} . By stretching the threads $\bar{b}A$ and $\bar{b}c$ it is set in opposition to the contractile powers of the threads, acting in the directions $\bar{b}A$ and $\bar{b}c$, and it is in immediate equilibrio with the equivalent of these two contractile forces. Therefore make $\bar{b}g$ equal to $\bar{b}\bar{f}$, and make it the diagonal of a parallelogram $\bar{h}b\bar{g}$. It is evident that $\bar{b}\bar{h}$, $\bar{b}\bar{i}$, are the forces exerted by the threads $\bar{b}A$, $\bar{b}c$. Then, seeing that the thread \bar{bc} is equally stretched in both directions, make $\bar{c}k$ equal to $\bar{b}\bar{i}$; $\bar{c}k$ is the contractile force which is excited at \bar{c} by the weight which is hanging there. Draw $\bar{h}l$ parallel to $\bar{c}\bar{d}$, and $\bar{l}m$ parallel to $\bar{b}c$. The

force $\bar{c}k$ is the equivalent of the contractile forces $\bar{c}h$, $\bar{c}m$, and is therefore equal and opposite to the force of gravity acting at C. In like manner, make $\bar{d}n = \bar{c}m$, and complete the parallelogram $\bar{n}d\bar{p}o$, having the vertical line $\bar{o}d$ for its diagonal. Then $\bar{d}n$ and $\bar{d}p$ are the contractile forces excited at \bar{d} , and the weight hanging there must be equal to $\bar{o}d$.

Therefore, the load at \bar{b} is to the load at \bar{d} as $\bar{b}g$ to $\bar{d}o$. But we have seen that the compressing forces at B, C, D may be substituted for the extending forces at \bar{b} , \bar{c} , \bar{d} . Therefore the weights at B, C, D which produce the compressions, are equal to the weights at \bar{b} , \bar{c} , \bar{d} which produce the extensions. Therefore

$$\bar{b}g : \bar{d}o = F \times \frac{AF}{AB} + G \times \frac{CG}{BC} : H \times \frac{CH}{CD} + I \times \frac{EI}{DE}.$$

Let us inquire what relation there is between this proportion of the loads upon the joints at B and D, and the angles which the rafters make at these joints with each other, and with the horizon or the plumb-lines. Produce AB till it cut the vertical Cc in Q; then draw BR parallel to CD, and BS parallel to DE. The similarity of the figures ABCDE and $A\bar{b}c\bar{d}E$, and the similarity of their position with respect to the horizontal and plumb lines, show, without any further demonstration, that the triangles QCB and $g\bar{b}i$ are similar, and that $QB : BC = g\bar{b} : \bar{b}i = \bar{h}\bar{b} : \bar{i}b$. Therefore QB is to BC as the contractile force exerted by the thread $A\bar{b}$ to that exerted by $\bar{b}c$; and therefore QB is to BC as the compression on BA to the compression on BC.¹ Then, because $\bar{b}i$ is equal to $\bar{c}k$, and the triangles CBR and ckl are similar, $CB : BR = \bar{c}k : kl = \bar{c}k : \bar{c}m$, and CB is to BR as the compression on CB to the compression on CD. And, in like manner, because $\bar{c}m = \bar{d}n$, we have BR to BS as the compression on DC to the compression on DE. Also $BR : RS = \bar{n}d : \bar{d}o$, that is, as the compression on DC to the load on D. Finally, combining all these ratios,

$$\begin{aligned} QC : CB &= g\bar{b} : \bar{b}i = g\bar{b} : \bar{h}\bar{c}, \\ CB : BR &= \bar{h}\bar{c} : kl = \bar{h}\bar{c} : \bar{d}n, \\ BR : BS &= \bar{n}d : no = \bar{d}n : no, \\ BS : RS &= no : do = no : do, \text{ we have finally} \\ QC : RS &= g\bar{b} : od = \text{load at B} : \text{load at D}. \end{aligned}$$

Now

$$\begin{aligned} QC : BC &= \sin. QBC : \sin. BQC = \sin. ABC : \sin. AB\bar{b}, \\ BC : BR &= \sin. BRC : \sin. BCR = \sin. CD\bar{d} : \sin. \bar{d}BC, \\ BR : RS &= \sin. BSR : \sin. RBS = \sin. \bar{d}DE : \sin. CDE. \end{aligned}$$

Therefore

$$QC : RS = \sin. ABC \sin. CD\bar{d} \sin. \bar{d}DE : \sin. CDE \sin. AB\bar{b} \sin. \bar{d}BC.$$

Or

$$QC : RS = \frac{\sin. ABC}{\sin. AB\bar{b} \sin. CB\bar{b}} : \frac{\sin. CDE}{\sin. \bar{d}DC \sin. \bar{d}\bar{D}E}.$$

That is, the loads on the different joints are as the sines of the angles at these joints directly, and as the products of the sines of the angles which the rafters make with the plumb-lines inversely.

Or, the loads are as the sines of the angles of the joints directly, and as the products of the cosines of the angles of elevation of the rafters inversely.

Or, the loads at the joints are as the sines of the angles at the joints, and as the products of the secants of the angles of elevation of the rafters jointly; for the secants of angles are inversely as the cosines.

Draw the horizontal line BT. It is evident, that if this be considered as the radius of a circle, the lines BQ, BC, BR, BS are the secants of the angles which these lines

¹ This proportion might have been shown directly without any use of the inverted figure, or consideration of contractile forces; but the substitution gives distinct notions of the mode of acting, even to persons not much conversant in such disquisitions; and we wish to make it familiar to the mind, because it gives an easy solution of the most complicated problems, and furnishes the practical carpenter, who has little science, with solutions of the most difficult cases by experiment. A festoon, as we called it, may easily be made; and we are certain that the forms into which it will arrange itself are models of perfect frames.

Roof. make with the horizon; and they are also as the thrusts of those rafters to which they are parallel. Therefore, the thrust which any rafter makes in its own direction is as the secant of its elevation.

The horizontal thrust is the same at all the angles. For $iu = kx = m\mu = nv = p\pi$. Therefore both walls are equally pressed out by the weight of the roof. We can find its quantity by comparing it with the load on one of the joints. Thus, $QC : CB = \sin. ABC : \sin. ABb$

$BC : BT = \text{rad.} : \sin. BCT = \text{rad.} : \sin. CBb$.

Therefore, $QC : BT = \text{rad.} \times \sin. ABC : \sin. bBA \times \sin. bBC$.

The length of the beams depends on the weights at the angles.

It deserves remark, that the lengths of the beams do not affect either the proportion of the load at the different joints, or the position of the rafters. This depends merely on the weights at the angles. If a change of length affects the weight, it indeed affects the form also; and this is generally the case. For it seldom happens, indeed it never should happen, that the weight on rafters of longer bearing is not greater. The covering alone increases nearly in the proportion of the length of the rafter.

If the proportion of the weights at B, C, and D is given, as also the position of any two of the lines, the position of all the rest is determined. If the horizontal distances between the angles are all equal, the forces on the different angles are proportional to the verticals drawn on the lines through these angles from the adjoining angle, and the thrusts from the adjoining angles are as the lines which connect them. If the rafters themselves are of equal lengths, the weights at the different angles are as these verticals and as the secants of the angles of elevation of the rafters jointly.

Practical inferences.

This proposition is very fruitful in its practical consequences. It is easy to perceive that it contains the whole theory of the construction of arches; for each stone of an arch may be considered as one of the rafters of this piece of carpentry, since all is kept up by its mere equilibrium. We may have an opportunity in a future article of exhibiting some very elegant and simple solutions of the most difficult cases of this important problem; and we now proceed to make use of the knowledge we have acquired for the construction of roofs.

To determine the best form of a kirb-roof.

We mentioned by the by a problem which is not unfrequent in practice, to determine the best form of a kirb-roof. M. Couplet of the Royal Academy of Paris has given a solution of it in an elaborate memoir in 1726, occupying several lemmas and theorems.

Let AE (fig. 11) be the width, and CF the height; it

Fig. 11.

is required to construct a roof ABCDE, whose rafters AB, BC, CD, DE, are all equal, and which shall be in equilibrium.

Roof.

Draw CE, and bisect it perpendicularly in H by the line DHG, cutting the horizontal line AE in G. About the centre G, with the distance GE, describe the circle EKC. It must pass through C, because CH is equal to HE and the angles at H are equal. Draw HK parallel to FE, cutting the circumference in K; draw CK, cutting GH in D; and join CD, ED. These lines are the rafters of half of the roof required.

We prove this by showing that the loads at the angles C and D are equal; for this is the proportion which results from the equality of the rafters, and the extent of surface of the uniform roofing which they are supposed to support. Therefore produce ED till it meet the vertical FC in N; and having made the side CBA similar to CDE, complete the parallelogram BCDP, and draw DB, which will bisect CP in R, as the horizontal line KH bisects CF in Q. Draw KF, which is evidently parallel to DP. Make CS perpendicular to CF, and equal to FG; and about S, with the radius SF, describe the circle FKW. It must pass through K, because SF is equal to CG, and CQ = QF. Draw WK, WS, and produce BC, cutting ND in O.

The angle WKF at the circumference is one half of the angle WSF at the centre, and is therefore equal to WSC or CGF. It is therefore double of the angle CEF or ECS. But ECS is equal to ECD and DCS, and ECD is one half of NDC, and DCS is one half of DCO or CDP. Therefore the angle WKF is equal to NDP, and WK is parallel to ND, and CF is to CW as CP to CN; and CN is equal to CP. But it has been shown above that CN and CP are as the loads upon D and C. These are therefore equal, and the frame ABCDE is in equilibrio.

A comparison of this solution with that of M. Couplet will show its great advantage in respect of simplicity and perspicuity; and the intelligent reader can easily adapt the construction to any proportion between the rafters AB and BC, which other circumstances, such as garret-rooms, &c. may render convenient. The construction must be

such that NC may be to CP as CD to $\frac{CD + DE}{2}$. What-

ever proportion of AB to BC is assumed, the point D' will be found in the circumference of a semicircle H'D'H', whose centre is in the line CE, and having $AB : BC = CH' : H'E = ch' : h'E$. The rest of the construction is simple.

In buildings which are roofed with slate, tile, or shingles, the circumstance which is most likely to limit the construction is the slope of the upper rafters CB, CD. This must be sufficient to prevent the penetration of rain, and the stripping by the winds. The only circumstance left in our choice in this case is the proportion of the rafters AB and BC. Nothing is easier than making NC to CP in any desired proportion when the angle BCD is given.

We need not repeat that it is always a desirable thing to form a truss for a roof in such a manner that it shall be in equilibrium. When this is done, the whole force of the struts and braces which are added to it is employed in preserving this form, and no part is expended in unnecessary strains. For we must now observe, that the equilibrium of which we have been treating is always of that kind which we call the tottering, and the roof requires stays, braces, or hanging timbers, to give it stiffness, or keep it in shape. We have also said enough to enable any reader acquainted with the most elementary geometry and mechanics, to compute the transverse strains and the thrusts to which the component parts of all roofs are exposed.

It only remains now to show the general maxims by which all roofs must be constructed, and the circumstances for which determine their excellence. In doing this we shall be exceedingly brief, and almost content ourselves with ex-

Roof. hibiting the principal forms, of which the endless variety of roofs are only slight modifications. We shall not trouble the reader with any account of such roofs as receive part of their support from the interior walls, but confine ourselves to the more difficult problem of throwing a roof over a wide building, without any intermediate support; because when such roofs are constructed in the best manner, that is, deriving the greatest possible strength from the materials employed, the best construction of the others is necessarily included. For all such roofs as rest upon the middle walls are roofs of smaller bearing. The only exception deserving notice is the roofs of churches, which have aisles separated from the nave by columns. The roof must rise on these. But if it is of an arched form internally, the horizontal thrusts must be nicely balanced, that they may not push the columns aside.

Simplest notion of a roof. The simplest notion of a roof-frame is, that it consists of two rafters AB and BC (fig. 12), meeting in the ridge.

Fig. 12.

But even this simple form is susceptible of better and worse. We have already seen, that when the weight of a square yard of covering is given, a steeper roof requires stronger rafters, and that when the scantling of the timbers is also given, the relative strength of a rafter is inversely as its length.

Best form of rafters.

But there is now another circumstance to be taken into the account, viz. the support which one rafter leg gives to the other. The best form of a rafter will therefore be that in which the relative strength of the legs, and their mutual support, give the greatest product. Mr Muller, in his *Military Engineer*, gives a determination of the best pitch of a roof, which has considerable ingenuity, and has been copied into many books of military education both in this island and on the continent. Describe on the width AC (fig. 13) the semicircle AFC, and bisect it by the radius FD. Produce the rafter AB to the circumference in E, join EC, and draw the perpendicular EG. Now $AB : AD = AC : AE$, and $AE = \frac{AD \times AC}{AB}$, and AE is inversely

Fig. 13.

as AB, and may therefore represent its strength in relation to the weight actually lying on it. Also the support which CB gives to AB is as CE, because CE is perpendicular to AB. Therefore the form which renders $AE \times EC$ a maximum seems to be that which has the greatest strength. But $AC : AE = EC : EG$, and $EG = \frac{AE \times EC}{AC}$, and is

therefore proportional to $AE \times EC$. Now EG is a maximum when B is in F, and a square pitch is in this respect the strongest. But it is very doubtful whether this construction is deduced from just principles. There is another strain to which the leg AB is exposed, which is not taken into the account. This arises from the curvature which it unavoidably acquires by the transverse pressure of its load. In this state it is pressed in its own direction by the abutment and load of the other leg. The relation be-

tween this strain and the resistance of the piece is not very distinctly known. Euler has given a dissertation on this subject, which is of great importance, because it affects posts and pillars of all kinds; and it is very well known that a post of ten feet long and six inches square will bear with great safety a weight which would crush a post of the same scantling and twenty feet long in a minute; but his determination has not been acquiesced in by the first mathematicians. Now it is in relation to these two strains that the strength of the rafter should be adjusted. The firmness of the support given by the other leg is of no consequence, if its own strength is inferior to the strain. The force which tends to crush the leg AB, by compressing it in its curved state, is to its weight as AB to BD, as is easily seen by the composition of forces; and its incurvation by this force has a relation to it, which is of intricate determination. It is contained in the properties demonstrated by Bernoulli of the elastic curve. This determination also includes the relation between the curvature and the length of the piece. But the whole of this seemingly simple problem is of much more difficult investigation than Mr Muller was aware of; and his rules for the pitch of a roof, and for the sally of a dock-gate, which depends on the same principles, are of no value. He is, however, the first author who attempted to solve either of these problems on mechanical principles susceptible of precise reasoning. Beldor's solutions, in his *Architecture Hydraulique*, are below notice.

Reasons of economy have made carpenters prefer a low pitch; and although this does diminish the support given by the opposite leg faster than it increases the relative strength of the other, it is not of material consequence, because the strength remaining in the opposite leg is still very great; for the supporting leg is acting against compression, in which case it is vastly stronger than the supported leg acting against a transverse strain.

But a roof of this simplicity will not do in most cases. Thrust on the walls. There is no notice taken, in its construction, of the thrust which it exerts on the walls. Now this is the strain which is the most hazardous of all. Our ordinary walls, instead of being able to resist any considerable strain pressing them outwards, require, in general, some ties to keep them on foot. When a person thinks of the thinness and height of the walls of even a strong house, he will be surprised that they are not blown down by any strong puff of wind. A wall three feet thick, and sixty feet high, could not withstand a wind blowing at the rate of thirty feet per second (in which case it acts with a force considerably exceeding two pounds on every square foot), if it were not stiffened by cross walls, joists, and roof, which all help to tie the different parts of the building together.

A carpenter is therefore exceedingly careful to avoid every horizontal thrust, or to oppose them by other forces. And avoided.

this introduces another essential part into the construction of a roof, namely, the tie or beam AC (fig. 14), laid from wall to wall, binding the feet A and C of the rafters together. This is the sole office of the beam; and it should be considered in no other light than as a string to prevent the roof from pushing out the walls. It is indeed used for carrying the ceiling

Fig. 14.

of the apartments under it, and it is even made to support a flooring. But, considered as making part of a roof, it is merely a string; and the strain which it withstands tends to tear its parts asunder. It therefore acts with its whole absolute force, and a very small scantling would suffice if we could contrive to fasten it firmly enough to the foot of the rafter. If it is of oak, we may safely subject it to a strain of three tons for every square inch of its sec-

Roof.

Roof.

tion. And fir will safely bear a strain of two tons for every square inch. But we are obliged to give the tie-beam much larger dimensions, that we may be able to connect it with the foot of the rafter by a mortise and tenon. Iron straps are also frequently added. By attending to this office of the tie-beam, the judicious carpenter is directed to the proper form of the mortise and tenon, and of the strap. We shall consider both of these in a proper place, after we become acquainted with the various strains at the joints of a roof.

These large dimensions of the tie-beam allow us to load it with the ceilings without any risk, and even to lay floors on it with moderation and caution. But when it has a great bearing or span, it is very apt to bend downwards in the middle, or, as the workmen term it, to sway or swag; and it requires a support. The question is, where to find this support. What fixed points can we find with which to connect the middle of the tie-beam? Some ingenious carpenter thought of suspending it from the ridge by a piece of timber BD (fig. 15), called by our carpenters the *king-post*.

Fig. 15.

It must be acknowledged, that there was very great ingenuity in this thought. It was also perfectly just. For the weight of the rafters BA, BC tends to make them fly out at the foot. This is prevented by the tie-beam, and this excites a pressure, by which they tend to compress each other. Suppose them without weight, and that a great weight is laid on the ridge B. This can be supported only by the abutting of the rafters in their own directions AB and CB, and the weight tends to compress them in the opposite directions, and, through their intervention, to stretch the tie-beam. If neither the rafters can be compressed, nor the tie-beam stretched, it is plain that the triangle ABC must retain its shape, and that B becomes a fixed point very proper to be used as a point of suspension. To this point, therefore, is the tie-beam suspended by means of the king-post. A common spectator unacquainted with carpentry views it very differently, and the tie-beam appears to him to carry the roof. The king-post appears a pillar resting on the beam, whereas it is really a string; and an iron rod of one sixteenth of the size would have done just as well. The king-post is sometimes mortised into the tie-beam, and pins put through the joint, which gives it more the look of a pillar with the roof resting on it. This does well enough in many cases. But the best method is to connect them by an iron strap like a stirrup, which is bolted at its upper ends into the king-post, and passes round the tie-beam. In this way a space is commonly left between the end of the king-post and the upper side of the tie-beam. Here the beam plainly appears hanging in the stirrup; and this method allows us to restore the beam to an exact level, when it has sunk by the unavoidable compression or other yielding of the parts. The holes in the sides of the iron strap are made oblong instead of round; and the bolt which is drawn through all is made to taper on the under side; so that driving it farther draws the tie-beam upwards. A notion of this may be formed by looking at fig. 16, which is a section of that post and beam.

Fig. 16.

It requires considerable attention, however, to make this suspension of the tie-beam sufficiently firm. The top of the king-post is cut into the form of the arch-stone of a bridge, and the heads of the rafters are firmly mortised into this projecting part. These projections are called *joggles*, and are formed by working the king-post out of a much larger piece of timber, and cutting off the unnecessary wood from

the two sides; and, lest all this should not be sufficient, it is usual in great works to add an iron plate or strap of three branches, which are bolted into the heads of the king-post and rafters.

The rafters, though not so long as the beam, seem to stand as much in need of something to prevent their bending, for they carry the weight of the covering. This cannot be done by suspension, for we have no fixed points above them. But we have now got a very firm point of support at the foot of the king-post. Braces, or rather *struts*, ED, FD (fig. 17), are put under the middle of the rafters, where they are slightly mortised, and their lower ends are firmly mortised into joggles formed on the foot of the king-post.

Fig. 17.

As these braces are very powerful in their resistance to compression, and the king-post equally so to resist extension, the points E and F may be considered as fixed; and the rafters being thus reduced to half their former length, have now four times their former relative strength.

Roofs do not always consist of two sloping sides meeting in a ridge. They have sometimes a flat on the top, with two sloping sides. They are sometimes formed with a topped double slope, and are called *herb* or *mansarde roofs*. They sometimes have a valley in the middle, and are then called *M roofs*. Such roofs require another piece, which may be called the *truss-beam*, because all such frames are called *trusses*, probably from the French word *trousse*, because such roofs are like portions of plain roofs *troussés* or shortened.

A flat-topped roof is thus constructed. Suppose the three rafters AB, BC, CD (fig. 18), of which AB and CD are equal, and BC horizontal. It is plain that they will be in equilibrium, and the roof have no tendency to go on either side. The tie-beam AD withstands the horizontal thrusts of the whole frame, and the two rafters AB and CD are each pressed in their own directions in consequence of their abutting with the middle rafter or truss-beam BC. It lies between them like the key-stone of an arch. They lean towards it, and it rests on them. The pressure which the truss-beam and its load excites on the two rafters is the very same as if the rafters were produced till they meet in G, and a weight were laid on these equal to that of BC and its load. If therefore the truss-beam is of a scantling sufficient for carrying its own load, and withstanding the compression from the two rafters, the roof will be equally strong, whilst it keeps its shape, as the plain roof AGD, furnished with the king-post and braces. We may conceive this another way. Suppose a plain roof AGD, without braces to support the middle B and C of the rafters. Then let a beam BC be put in between the rafters, abutting upon little notches cut in the rafters. It is evident that this must prevent the rafters from bending downwards, because the points B and C cannot descend, moving round the centres A and D, without shortening the distance BC between them. This cannot be without compressing the beam BC. It is plain that BC may be wedged in, or wedges driven in between its ends B and C and the notches in which it is lodged. These wedges may be driven in till they even force out the rafters GA and GD. Whenever this happens, all the mutual pressure of the heads of these rafters at G is taken away, and the parts GB and GC may be cut away, and the

Fig. 18.

Roof.

roof ABCD will be as strong as the roof AGD furnished with the king-post and braces, because the truss-beam gives a support of the same kind at B and C as the brace would have done.

But this roof ABCD would have no firmness of shape. Any addition of weight on one side would destroy the equilibrium at the angle, would depress that angle, and would cause the opposite one to rise. To give it stiffness, it must either have ties or braces, or something partaking of the nature of both. The usual method of framing is to make the heads of the rafters abut on the joggles of two side-posts BE and CF, whilst the truss-beam, or strut as it is generally termed by the carpenters, is mortised square into the inside of the heads. The lower ends E and F of the side-posts are connected with the tie-beam either by mortises or straps.

This construction gives firmness to the frame; for the angle B cannot descend in consequence of any inequality of pressure, without forcing the other angle C to rise. This it cannot do, being held down by the post CF. And the same construction fortifies the tie-beam, which is now suspended at the points E and F from the points B and C, whose firmness we have just now shown.

They are not so strong as the plain roofs.

But although this roof may be made abundantly strong, it is not quite so strong as the plain roof AGD of the same scantling. The compression which BC must sustain in order to give the same support to the rafters at B and C that was given by braces properly placed, is considerably greater than the compression of the braces. And this strain is an addition to the transverse strain which BC gets from its own load. This form also necessarily exposes the tie-beam to cross strains. If BE is mortised into the tie-beam, then the strain which tends to depress the angle ABC presses on the tie-beam at E transversely, whilst a contrary strain acts on F, pulling it upwards. These strains, however, are small; and this construction is frequently used, being susceptible of sufficient strength, without much increase of the dimensions of the timbers; and it has the great advantage of giving free room in the garrets.

Were it not for this, there is a much more perfect form represented in fig. 19. Here the two posts BE, CF are united below. All transverse action on the tie-beam is now entirely removed. We are almost disposed to say that this is the strongest roof of the same width and slope. For if the iron strap which connects the pieces BE, CF with the tie-beam have a large bolt G through it, confining it to one point of the beam, there are five points, A, B, C, D, G, which cannot change their places, and there is no transverse strain in any of the connections.

When the dimensions of the building are very great, so that the pieces AB, BC, CD, would be thought too weak for withstanding the cross strains, braces may be added as is expressed in fig. 18 by the dotted lines. The reader will observe, that it is not meant to leave the top flat externally; it must be raised a little in the middle, to shoot off the rain. But this must not be done by incurvating the beam BC. This would soon be crushed, and spring upwards. The slopes must be given by pieces of timber added above the strutting-beam.

And thus we have completed a frame of a roof. It consists of these principal members: the rafters, which are immediately loaded with the covering; the tie-beam, which withstands the horizontal thrust by which the roof tends to fly out below and push out the walls; the king-posts, which hang from fixed points and serve to uphold the tie-beam, and also to afford other fixed points on which we may rest the braces which support the middle of the rafters; and,

Members of which the frame of a roof consists.

Fig. 19.

lastly, the truss or strutting-beam, which serves to give mutual abutment to the different parts which are at a distance from each other. The rafters, braces, and trusses are exposed to compression, and must therefore have not only cohesion, but stiffness. For if they bend, the prodigious compressions to which they are subjected would quickly crush them in this bended state. The tie-beams and king-posts, if performing no other office but supporting the roof, do not require stiffness; and their places might be supplied by ropes, or by rods of iron of one-tenth part of the section that even the smallest oak stretcher requires. These members require no greater dimensions than what is necessary for giving sufficient joints, and any more is a needless expense. All roofs, however complicated, consist of these essential parts; and if pieces of timber are to be seen which perform none of these offices, they must be pronounced useless, and they are frequently hurtful, by producing cross strains in some other piece. In a roof properly constructed there should be no such strains. All the timbers, excepting those which immediately carry the covering, should be either pushed or drawn in the direction of their length. And this is the rule by which a roof should always be examined.

These essential parts are susceptible of numberless combinations and varieties. But it is a prudent maxim to make the construction as simple, and consisting of as few parts, as possible. We are the less exposed to the imperfections of workmanship, such as loose joints, &c. Another essential harm arises from many pieces, by the compression and the shrinking of the timber in the cross direction of the fibres. The effect of this is equivalent to the shortening of the piece which abuts on the joint. This alters the proportions of the sides of the triangle on which the shape of the whole depends. Now, in a roof such as fig. 18, there is twice as much of this as in the plain pent-roof, because there are two posts. And when the direction of the abutting pieces is very oblique to the action of the load, a small shrinking permits a great change of shape. Thus, in a roof of what is called pediment pitch, where the rafters make an angle of thirty degrees with the horizon, half an inch compression of the king-post will produce a sagging of an inch, and occasion a great strain on the tie-beam, if the posts are mortised into it.

This method of including a truss within the rafters of a pent-roof is a very considerable addition to the art of carpentry. But to insure its full effect, it should always be executed with abutting rafters under the principal ones, abutting on joggles in the heads of the posts. Without this the strut-beam is hardly of any service.

We would therefore recommend fig. 20 as a proper construction of a trussed roof; and the king-post which is placed in it may be employed to support the upper part of the rafters, and also for preventing the strut-beam from bending in their direction in consequence of its great compression. It will also give a suspension for the great burdens which are sometimes necessary in a theatre. The machinery has no other firm points to which it can be attached; and the portions of the single rafters which carry this king-post are but short, and therefore may be considerably loaded with safety.

We observe in the drawings which we sometimes have of Chinese buildings, that the trussing of roofs is understood by them. Indeed they must be very experienced carpenters. We see wooden buildings run up to a great height, which can be supported only by such trussing. One of these is sketched in fig. 21. There are some very excellent specimens to be seen in the buildings at Deptford, be-

Roof.

Fig. 20.

Root. longing to the victualling-office, commonly called the *Red-house*, which were erected about the year 1788, and we believe are the performance of Mr James Arrow of the Board of Works, one of the most intelligent artists in this kingdom.

Remarks addressed to practical carpenters. Thus have we given an elementary, but a rational or scientific, account of this important part of the art of carpentry. It is such, that any practitioner, with the trouble of a little reflection, may always proceed with confidence, and without resting any part of his practice on the vague notions which habit may have given him of the strength and supports of timbers, and of their manner of acting. That these frequently mislead, is proved by the mutual criticisms which are frequently published by the rivals in the profession. They have frequently sagacity enough, for it seldom can be called science, to point out glaring blunders; and any person who will look at some of the performances of Mr Price, Mr Wyatt, Mr Arrow, and others of acknowledged reputation, will readily see them distinguishable from the works of inferior artists by simplicity alone. A man without principles is apt to consider an intricate construction as ingenious and effectual; and such roofs sometimes fail merely by being ingeniously loaded with timber, but still more frequently by the wrong action of some useless pieces, which produces strains that are transverse to other pieces, or which, by rendering some points too firm, cause them to be deserted by the rest in the general subsiding of the whole. Instances of this kind are pointed out by Price in his *British Carpenter*. Nothing shows the skill of a carpenter more than the distinctness with which he can foresee the changes of shape which must take place in a short time in every roof. A knowledge of this will often correct a construction which the mere mathematician thinks unexceptionable, because he does not reckon on the actual compression which must obtain, and imagines that his triangles, which sustain no cross strains, invariably retain their shape till the pieces break. The sagacity of the experienced carpenter is not, however, enough without science for perfecting the art. But when he knows how much a particular piece will yield to compression in one case, science will then tell him, and nothing but science can do it, what will be the compression of the same piece in another very different case. Thus he learns how far it will now yield, and then he proportions the parts so to each other, that when all have yielded according to their strains, the whole is of the shape he wished to produce, and every joint is in a state of firmness. It is here that we observe the greatest number of improprieties. The iron straps are frequently in positions not suited to the actual strain on them; and they are in a state of violent twist, which both tends strongly to break the straps, and to cripple the pieces which they surround.

In like manner, we frequently see joints or mortises in a state of violent strain on the tenons, or on the heels and shoulders. The joints were perhaps properly shaped for the primitive form of the truss; but by its settling, the bearing of the push is changed. The brace, for example, in a very low-pitched roof, comes to press with the upper part of the shoulder, and, acting as a powerful lever on the tenon, breaks it. In like manner, the lower end of the brace, which at first abutted firmly and squarely on the joggle of the king-post, now presses with one corner in prodigious force, and seldom fails to splinter off on that side. We cannot help recommending a maxim of M. Perronet, the celebrated hydraulic architect of France, as a golden rule, viz. to make all the shoulders of abutting pieces in the form of an arch of a circle, having the opposite end of the piece for its centre. Thus, in fig. 18, if the joggle-point B be of

Fig. 21.

this form, having A for its centre, the sagging of the roof will make no partial bearing at the joint; for in the sagging of the roof the piece AB turns or bends round the centre A, and the counter-pressure of the joggle is still directed to A, as it ought to be. We have just now said *bends* round A. This is too frequently the case, and it is always very difficult to give the tenon and mortise in this place a true and invariable bearing. The rafter pushes in the direction BA, and the beam resists in the direction AD. The abutment should be perpendicular to neither of these, but in an intermediate direction, and it ought also to be of a curved shape. But the carpenters perhaps think that this would weaken the beam too much to give it this shape in the shoulder; they do not even aim at it in the heel of the tenon. The shoulder is commonly even with the surface of the beam. When the bearing therefore is on this shoulder, it causes the foot of the rafter to slide along the beam till the heel of the tenon bears against the outer end of the mortise (See Price's *British Carpenter*, plate C, fig. 1K). This abutment is perpendicular to the beam in Price's book; but it is more generally pointed a little outwards below, to make it more secure against starting. The consequence of this construction is, that when the roof settles, the shoulder comes to bear at the inner end of the mortise, and it rises at the outer, and the tenon, taking hold of the wood beyond it, either tears it out or is itself broken. This joint therefore is seldom trusted to the strength of the mortise and tenon, and is usually secured by an iron strap, which lies obliquely to the beam, to which it is bolted by a large bolt quite through, and then embraces the outside of the rafter foot. This strap is very frequently not made sufficiently oblique, and we have seen some made almost square with the beam. When this is the case, it not only keeps the foot of the rafter from flying out, but it binds it down. In this case, the rafter acts as a powerful lever, whose fulcrum is in the inner angle of the shoulder, and then the strap never fails to cripple the rafter at the point. All this can be prevented only by making the strap very long and very oblique, and by making its outer end (the stirrup part) square with its length, and making a notch in the rafter foot to receive it. It cannot now cripple the rafter, for it will rise along with it, turning round the bolt at its inner end. We have been thus particular on this joint, because it is here that the ultimate strain of the whole roof is exerted, and its situation will not allow the excavation necessary for making it a good mortise and tenon.

Similar attention must be paid to some other straps, such as those which embrace the middle of the rafter, and connect it with the post or truss below it. We must attend to the change of shape produced by the sagging of the roof, and place the strap in such a manner as to yield to it by turning round its bolt, but so as not to become loose, and far less to make a fulcrum for any thing acting as a lever. The strains arising from such actions, in framings of carpentry which change their shape by sagging, are enormous, and nothing can resist them.

We shall close this part of the subject with a simple method, by which any carpenter, without mathematical science, may calculate with sufficient precision the strains or thrusts which are produced on any point of his work, whatever be the obliquity of the pieces.

Let it be required to find the horizontal thrust acting on the tie-beam AD of fig. 18. This will be the same as if the weight of the whole roof were laid at G on the two rafters GA and GD. Draw the vertical line GII. Then, having calculated the weight of the whole roof that is supported by this single frame ABCD, including the weight of the pieces AB, BC, CD, BE, CF themselves, take the number of pounds, tons, &c. which expresses it from any scale of equal parts, and set it from G to II. Draw HK,

Roof. HL parallel to GD, GA, and draw the line KL, which will be horizontal when the two sides of the roof have the same slope. Then ML measured on the same scale will give the horizontal thrust, by which the strength of the tie-beam is to be regulated. GL will give the thrust which tends to crush the rafters, and LM will also give the force which tends to crush the strut-beam BC.

In like manner, to find the strain of the king-post BD of fig. 17, consider that each brace is pressed by half the weight of the roofing laid on BA or BC, and this pressure, or at least its hurtful effect, is diminished in the proportion of BA to DA, because the action of gravity is vertical, and the effect which we want to counteract by the braces is in a direction Ee perpendicular to BA or BC. But as this is to be resisted by the brace fE acting in the direction fE, we must draw fe perpendicular to Ee, and suppose the strain augmented in the proportion of Ee to Ef.

Having thus obtained in tons, pounds, or other measures, the strains which must be balanced at f by the cohesion of the king-post, take this measure from the scale of equal parts, and set it off in the directions of the braces to G and H, and complete the parallelogram GfHK; and fK measured on the same scale will be the strain on the king-post.

Strength of the truss. The artist may then examine the strength of his truss upon this principle, that every square inch of oak will bear at an average 7000 pounds compressing or stretching it, and may be safely loaded with 3500 for any length of time; and that a square inch of fir will in like manner securely bear 2500. And, because straps are used to resist some of these strains, a square inch of well-wrought tough iron may be safely strained by 50,000 pounds. But the artist will always recollect, that we cannot have the same confidence in iron as in timber. The faults of this last are much more easily perceived; and when the timber is too weak, it gives us warning of its failure by yielding sensibly before it breaks. This is not the case with iron; and much of its service depends on the honesty of the blacksmith.

Sketch of some trussed roofs, &c. In this way may any design of a roof be examined. We shall here give the reader a sketch of two or three trussed roofs, which have been executed in the chief varieties of circumstances which occur in common practice.

Fig. 22 is the roof of St Paul's Church, Covent Garden,

Fig. 22.

London, the work of Inigo Jones. Its construction is singular. The roof extends to a considerable distance beyond the building, and the ends of the tie-beams support the Tuscan cornice, appearing like the mutules of the Doric order. Such a roof could not rest on the tie-beam. Inigo Jones has therefore supported it by a truss below it; and the height has allowed him to make this extremely strong with very little timber. It is accounted the highest roof of its width in London. But this was not difficult, by reason of the great height which its extreme width allowed him to employ without hurting the beauty of it by too high a pitch. The supports, however, are disposed with judgment.¹

Roof. Fig. 23 is a kirk or mansarde roof by Price, and supposed to be of large dimensions, having braces to carry the middle of the rafters. It will serve exceedingly well for a church having pillars. The middle part of the tie-beam being taken away, the strains are very well balanced, so that there is no risk of its pushing aside the pillar on which it rests.

Fig. 23.

Fig. 24 is the celebrated roof of the Theatre of the Uni-

Fig. 24.

versity of Oxford, by Sir Christopher Wren. The span between the walls is 75 feet. This is accounted a very ingenious, and is a singular performance. The middle part of it is almost unchangeable in its form; but from this circumstance it does not distribute the horizontal thrust with the same regularity as the usual construction. The horizontal thrust on the tie-beam is about twice the weight of the roof, and is withstood by an iron strap below the beam, which stretches the whole width of the building in the form of a rope, making part of the ornament of the ceiling.

In all the roofs which we have considered hitherto, the thrust is discharged entirely from the walls by the tie-beam. But this cannot always be done. We frequently want great elevation within, and arched ceilings. In such cases, it is a much more difficult matter to keep the walls free of all pressure outwards, and there are few buildings where it is completely done. Yet this is the greatest fault of a roof. We shall just point out the methods which may be most successfully adopted.

We have said that a tie-beam just performs the office of a string. We have said the same of the king-post. Now suppose two rafters AB, BC (fig. 25), moveable about the point B, and resting on the top of the walls. If the line BD be suspended from B, and the two lines DA, DC be fastened to the feet of the rafters, and if these lines be incapable of extension, it is plain that all thrust is removed from the walls as effectually as by a common tie-beam; and by shortening BD to Bd, we gain a greater inside height, and more room for an arched ceiling. Now if we substitute a king-post BD (fig. 26), and two stretchers or hammer-beams DA, DC for the other strings, and connect them firmly by means of iron straps, we obtain our purpose.

Fig. 25.

Fig. 26.

Let us compare this roof with a tie-beam roof in point of strain and strength. Recur to fig. 25, and complete the parallelogram ABCF, and draw the diagonals AC, BF, crossing in E. Draw BG perpendicular to CD. We have

¹ This church was burnt down after the present article was written.

Roof. seen that the weight of the roof, which we may call W , is to the horizontal thrust at C as BF to EC ; and if we express this thrust by T , we have $T = \frac{W \times EC}{BF}$. We may

at present consider BC as a lever moveable round the joint B , and pulled at C in the direction EC by the horizontal thrust, and held back by the string pulling in the direction CD . Suppose that the forces in the directions EC and CD are in equilibrio, and let us find the force S by which the string CD is strained. These forces must, by the property of the lever, be inversely as the perpendiculars drawn from the centre of motion on the lines of their direction.

Therefore $BG : BE = T : S$, and $S = T \times \frac{BE}{BG} = W \times \frac{BE \cdot EC}{BF \cdot BG}$.

Therefore the strain upon each of the ties DA and DC is always greater than the horizontal thrust or the strain on a simple tie-beam. This would be no great inconvenience, because the smallest dimensions that we could give to these ties, so as to procure sufficient fixtures to the adjoining pieces, are always sufficient to withstand this strain. But although the same may be said of the iron straps which make the ultimate connections, there is always some hazard of imperfect work, cracks, or flaws, which are not perceived. We can judge with tolerable certainty of the soundness of a piece of timber, but cannot say so much of a piece of iron. Moreover, there is a prodigious strain excited on the king-post when BG is very short in comparison of BE , namely, the force compounded of the two strains S and S on the ties DA and DC .

But there is another defect from which the straight tie-beam is entirely free. All roofs settle a little. When this roof settles, and the points B and D descend, the legs BA , BC must spread further out, and thus a pressure outwards is excited on the walls. It is seldom therefore that this kind of roof can be executed in this simple form, and other contrivances are necessary for counteracting this supervening action on the walls. Fig. 27 is one of the best which

Fig. 27.

we have seen, and is executed with great success in the circus or equestrian theatre (now, 1809, a concert-room) in Edinburgh, the width being sixty feet. The pieces EF and ED help to take off some of the weight, and by their greater uprightness they exert a smaller thrust on the walls. The beam Dd is also a sort of truss-beam, having something of the same effect. Mr Price has given another very judicious one of this kind (British Carpenter, plate IK, fig. C), from which the tie-beam may be taken away, and there will remain very little thrust on the walls. Those which he has given in the following plate, K, are, in our opinion, very faulty. The whole strain in these last roofs tends to break the rafters and ties transversely, and the fixtures of the ties are also not well calculated to resist the strain to which the pieces are exposed. We hardly think that these roofs could be executed.

It is scarcely necessary to remind the reader, that in all that we have delivered on this subject, we have attended only to the construction of the principal rafters or trusses.

In small buildings all the rafters are of one kind; but in great buildings the whole weight of the covering is made to rest on a few principal rafters, which are connected by beams placed horizontally, and either mortised into them or scarfed on them. These are called *purlins*. Small rafters are laid from purlin to purlin; and on these the laths for tiles, or the skirting-boards for slates, are nailed. Thus the covering does not immediately rest on the principal frames. This allows some more liberty in their construction, because the garrets can be so divided that the principal rafters shall be in the partitions, and the rest left unencumbered. This construction is so far analogous to that of floors which are constructed with girders, binding, and bridging joists.

It may appear presuming in us to question the propriety of this practice. There are situations in which it is unavoidable, as in the roofs of churches, which can be allowed to rest on some pillars. In other situations, where partition-walls intervene at a distance not too great for a stout purlin, no principal rafters are necessary, and the whole may be roofed with short rafters of very slender scantling. But in a great uniform roof, which has no intermediate supports, it requires at least some reasons for preferring this method of carcass-roofing to the simple method of making all the rafters alike. The method of carcass-roofing requires the selection of the greatest logs of timber, which are seldom of equal strength and soundness with thinner rafters. In these the outside planks can be taken off, and the best part alone worked up. It also exposes to all the defects of workmanship in the mortising of purlins, and the weakening of the rafters by this very mortising; and it brings an additional load of purlins and short rafters. A roof thus constructed may surely be compared with a floor of similar construction. Here there is not a shadow of doubt, that if the girders were sawed into planks, and these planks laid as joists sufficiently near for carrying the flooring boards, they will have the same strength as before, except so much as is taken out of the timber by the saw. This will not amount to one-tenth part of the timber in the binding, bridging, and ceiling joists, which are an additional load, and all the mortises and other joinings are so many diminutions of the strength of the girders; and as no part of a carpenter's work requires more skill and accuracy of execution, we are exposed to many chances of imperfection. But, not to rest on these considerations, however reasonable they may appear, we shall relate an experiment made by one on whose judgment and exactness we can depend.

Two models of floors were made, eighteen inches square, of the finest uniform deal, which had been long seasoned. The one consisted of simple joists, and the other was framed with girders, binding, bridging, and ceiling joists. The plain joists of the one contained the same quantity of timber with the girders alone of the other, and both were made by a most accurate workman. They were placed in wooden trunks eighteen inches square within, and rested on a strong projection on the inside. Small shot was gradually poured in upon the floors, so as to spread uniformly over them. The plain joisted floor broke down with 487 pounds, and the carcass floor with 327. The first broke without giving any warning, and the other gave a violent crack when 294 pounds had been poured in. A trial had been made before, and the loads were 341 and 482; but the models having been made by a less accurate hand, it was not thought a fair specimen of the strength which might be given to a carcass floor.

The only argument of weight which we can recollect in favour of the compound construction of roofs is, that the plain method would prodigiously increase the quantity of work, would admit nothing but long timber, which would greatly add to the expense, and would make the garrets a mere thicket of planks. We admit this in its full force;

Roof.

Of the
roofs put
on round
buildings.

but we continue to be of the opinion that plain roofs are greatly superior in point of strength, and therefore should be adopted in cases where the main difficulty is to insure this necessary circumstance.

It would appear very neglectful to omit an account of the roofs put on round buildings, such as domes, cupolas, and the like. They appear to be the most difficult tasks in the carpenter's art. But the difficulty lies entirely in the mode of framing, or what the French call the *trait de charpenterie*. The view which we are taking of the subject, as a part of mechanical science, has little connection with this. It is plain, that whatever form of a truss is excellent in a square building, must be equally so as one of the frames of a round one; and the only difficulty is how to manage their mutual intersections at the top. Some of them must be discontinued before they reach that length, and common sense will teach us to cut them short alternately, and always leave as many, that they may stand equally thick as at their first springing from the base of the dome. Thus the length of the purlins, which reach from truss to truss, will never be too great.

The truth is, that a round building which gathers in at top, like a glass-house, a potter's kiln, or a spire steeple, instead of being the most difficult to erect with stability, is of all others the easiest. Nothing can show this more forcibly than daily practice, where they are run up without centres and without scaffoldings; and it requires gross blunders indeed in the choice of their outline to put them in much danger of falling from a want of equilibrium. In like manner, a dome of carpentry can hardly fall, give it what shape or what construction you will. It *cannot* fall, unless some part of it flies out at the bottom. An iron hoop round it, or straps at the joinings of the trusses and purlins, which make an equivalent to a hoop, will effectually secure it. And as beauty requires that a dome shall spring almost perpendicularly from the wall, it is evident that there is hardly any thrust to force out the walls. The only part where this is to be guarded against is where the tangent is inclined about forty or fifty degrees to the horizon. Here it will be proper to make a course of firm horizontal joinings.

We doubt not but that domes of carpentry will now be raised of great extent. The Halle du Bled at Paris, of two hundred feet in diameter, was the invention of an intelligent carpenter, the Sieur Moulineau. He was not by any means a man of science, but had much more mechanical knowledge than artisans usually have, and was convinced that a very thin shell of timber might not only be so shaped as to be nearly in equilibrio, but that, if hooped or firmly connected horizontally, it would have all the stiffness that was necessary; and he presented his project to the magistracy of Paris. The grandeur of it pleased them, but they doubted of its possibility. Being a great public work, they prevailed on the Academy of Sciences to consider it. The members who were competent judges were instantly struck with the justness of M. Moulineau's principles, and astonished that a thing so plain had not been long familiar to every house-carpenter. It quickly became an universal topic of conversation, dispute, and cabal, in the polite circles of Paris. But the academy having given a very favourable report of their opinion, the project was immediately carried into execution, and soon completed; and now stands as one of the great exhibitions of Paris.

The construction of this dome is the simplest thing that can be imagined. The circular ribs which compose it consist of planks nine feet long, thirteen inches broad, and three inches thick; and each rib consists of three of these planks bolted together in such a manner that two points meet. A rib is begun, for instance, with a plank of three feet long standing between one of six feet and another of nine; and this is continued to the head of it. No machinery was necessary for carrying up such small pieces, and the

whole went up like a piece of bricklayer's work. At various distances these ribs were connected horizontally by purlins and iron straps, which made so many hoops to the whole. When the work had reached such a height that the distance of the ribs was two thirds of the original distance, every third rib was discontinued, and the space was left open and glazed. When carried so much higher that the distance of the ribs is one third of the original distance, every second rib, now consisting of two ribs very near each other, is in like manner discontinued, and the void is glazed. A little above this the heads of the ribs are framed into a circular ring of timber, which forms a wide opening in the middle; over which is a glazed canopy or umbrella, with an opening between it and the dome for allowing the heated air to get out. All who have seen this dome say that it is the most beautiful and magnificent object they have ever beheld.

The only difficulty which occurs in the construction of wooden domes is when they are unequally loaded, by carrying a heavy lanthorn or cupola in the middle. In such a case, if the dome were a mere shell, it would be crushed in at the top, or the action of the wind on the lanthorn might tear it out of its place. Such a dome must therefore consist of trussed frames. Mr Price has given a very good one in his plate OP, though much stronger in the trusses than there was any occasion for. This causes a great loss of room, and throws the lights of the lanthorn too far up. It is evidently copied from Sir Christopher Wren's dome of St Paul's Church in London; a model of propriety in its particular situation, but by no means a general model of a wooden dome. It rests on the brick cone within it; and Sir Christopher has very ingeniously made use of it for stiffening this cone, as any intelligent person will perceive by attending to its construction.

Fig. 28 presents a dome executed in the Register Office in Edinburgh by James and Robert Adam, and is very

Fig. 28.

agreeable to mechanical principles. The span is fifty feet clear, and the thickness is only four and a half feet. (J. R.)

Causes of Failure in Roofs.

It has been shown in the preceding treatise that the simplest form of a roof is that given in fig. 12. Let us now inquire the method in which such a roof would fail, as deduced from the former treatise, and given there in scientific language. Let the dotted lines (fig. 29) show the original line of roof. If an undue weight be put on this, it has been shown the point B will descend, and A and C will spread or open to the right and left, just as pressing on the top of a pair of compasses makes them open. The rafters must then either slip off the top of the walls, or, if properly secured to them, which we ought to suppose, must push the walls over; or if they be very strong, the rafters must bend or sag in the middle at D and E (fig. 30). Now, to prevent the walls being thrust over, an easy remedy, as our author shows, is fig. 14, to tie them together with either a piece of string or a rod of timber, or, as Mr Robert Stephenson (art. IRON BRIDGES, fig. 13) shows, by a chain. But whether the walls be kept upright by this tie or by their own size and strength, still the same bending

Roof.

Roof. at D and E will take place if the timbers be not strong enough to bear the weight. Now, in small roofs we have a ready

Fig. 29.

remedy; we put a collar beam DE (fig. 31) between them, which has a double effect,—it not only keeps these points

Fig. 30.

from coming towards each other, which they must do if the rafters bend, but it also assists very much to prevent the rafters AB, BC, going out, as is shown in fig. 29. If, however, the roof be too large and the timbers too weak, or, which is the same thing, the load be too heavy, the roof, though it cannot bend (fig. 31) between BD, BE, will yield be-

Fig. 31.

tween DA, EC; and either sag, as we have before said, or push out the walls if they are too weak. This is the great

cause of failure in the early mediæval roofs (see figs. 35' 38), where they are all weak between A and B. However trusses may be braced together at the apex of the triangle, it is clear nothing except excessive thickness of timber will prevent one of these results. We will now go back to fig. 14, and for the present lay aside the consideration of a collar-beam. We are here liable to fall into this contingency,—the beam AC must have considerable weight if strong enough to act as an efficient tie. Now wood is always weakest in horizontal position; it is therefore liable to sink or sag in the middle, and the effect of this will be to bring the points AC (fig. 32) closer together, and to

Fig. 32.

pull the walls in. It would interfere with our space to prop this beam up from below; but some ingenious carpenter at some time has thought of hanging it up to the ridge by another string or tie, BD (fig. 15), usually called a king-post, though it does not act as a post to prop up, as is shown above, but as a string or tie, to hang up the tie-beam and keep it straight. We will now suppose the rafters AB, BC (fig. 15) too weak for their weight. We must bear in mind, in all questions of carpentry, there are two difficulties to contend with. First, timber itself is limited in size; and next, if it be made too strong for its length, its own weight will cause it to bend. So we are between two difficulties. But we have several remedies: either we may resort to a collar-beam in addition to a tie-beam, as in fig. 31; or, what is better, we may employ two struts, DE, DF (fig. 17). An inspection of this diagram will show why, although a chain or rod would answer every purpose at BD, we prefer a post of wood. The struts FD, ED are supports and not ties, and require a good butment, which is best got by framing them into the king-post, as shown at D (fig. 17), and also in the various diagrams of the article CARPENTRY. Still referring to the same diagram (fig. 17), we will suppose the span still further increased; then the tie-beam may be too weak, and may sag between AD and DC. This must be remedied by again suspending the weak parts, which may be done by two rods or posts BE, CF (fig. 18), which are generally called queen-posts, as BD (figs. 15 and 17) is called a king. This system divides the tie into three parts instead of two, or if a king-post also be used, into four parts, each of which is suspended. Fig. 18, however, shows what is generally called a queen-post roof, and is framed with a collar BC, in the points of which the purlins are usually seated, and the common rafters run up, as AG, DG, unless, as in the figure, it is intended to make the roof flat between B and C. In the same manner, an inspection of

Roof.

the diagram following will show (as well as those in CARPENTRY), and *infra* fig. 51, how the principle of using queen-posts and struts may be multiplied almost to any extent.

Roofs sometimes fail in consequence of the trusses being placed too far apart; the purlins are then unable to sustain the weight, and the surface undulates between truss and truss, bringing down the ridge, and producing the most unpleasant and sometimes pernicious effects. The mediæval architects braced the purlins upon the principles as shown in fig. 40. A better plan, however, has been devised at the Lambeth Baths, which will be hereafter described.

Roofs also frequently fail from the weakness of walls, or the want of extra thickness under the principals; but this is rather matter for consideration under the article STONE MASONRY. They, however, often fail from a simpler cause. The plate or template is generally of timber, and bedded into the wet brickwork. It swells with the moisture, and afterwards shrinks, which causes it to lose its hold in the walls; so that in case of settlement it is easily pulled out; and the walls, which should be kept upright by the tension of the tie-beams, are unsupported, and settle outwards. The best remedy is to make the templates of stone, and pin down the tie-beams to them by strong iron pins, going some depth into the walls. There is another benefit about this system, that air may be allowed to come sideways to the rafter feet, or ends of the tie-beams, and so prevent their becoming rotten.

Mediæval Roofs.

Those of the Italian basilicas, erected before the tenth century, are framed much according to the present methods: of the same pitch, and covered with tiles like those which have been in use from the Roman period down to the pre-

Fig. 33.

sent day. Fig. 33 shows the roof of San Paolo Fuori le Mura, lately consumed by fire at Rome. It is upwards of 84 feet in span, and consists of a king-post and two queens, without struts, but with a collar. The principal rafter is doubled from the head of the queen to the plate, which adds immensely to its strength. The kings and queens are not framed into the tie-beam, but the latter is hung up to them by iron straps. This perhaps is the earliest instance known where iron has formed one of the chief features in the construction of a roof, and this is said to have stood upwards of 1400 years. A curious instance of a roof is found in the tomb of Theodosius at Ravenna, supposed to have been erected shortly after the year 526; this is composed of a circular dome of white marble 36 feet in diameter, surrounded by a number of ears or lugs, by which

no doubt it was hoisted to its place. It is of one huge single block, all chiselled out of the solid. Roof.

Of Saxon roofs we have no remains; but from the illuminations in the MSS. of the *Ælfric Pentateuch*, and to Cædmon, now in the British Museum, we should suppose they formed an angle of 45°. They seem to be covered with a sort of tiles rounded at the end, or they probably may have been of shingles. A very curious instance, taken from the Harleian MS. (fig. 34), shows not only a gabled roof,

Fig. 34.

but also a sort of dome. The subject is Lot entertaining the two angels.

Few Norman roofs now remain, if any, and those which are supposed to be so are evidently much altered. Judging from the string courses up the gables, and the water-

tables, they seem to have been of about the same angle as those named above; but in the next style, the early English, as has before been stated, the roofs suddenly sprung up to equilateral, and often even to whole pitch, or an angle of 64°. The singularity is, that many of them are covered with lead, and groined beneath; so that if bare economy or dry utility were the only object of the Gothic architects, as has been stated by many, the roof might have been flat, and an immense expense both in timber and lead have been saved. It only serves to show that, like all other architects, they were not always guided by considerations of dry utility alone, but had high, bold, artistic, and æsthetic feeling besides. It is not improbable that, as the pointed arch and slender shaft are evidently of Saracenic origin, and their use no doubt brought to Europe by the Crusaders,

so the aspiring roofs of the refined orientals suggested those of the early English period.

Year by year, as styles changed, the roofs became of less pitch, till in the latter styles, as has been stated, many, if covered with lead, became almost flat. A very curious illustration is found in the tower of St Regulus' church at St Andrews, on which are the marks of the lines of three roofs which have covered the building at three different periods. The lower is probably the line of the original Norman roof, the upper that of the early English period, and the middle that of the decorated. Much of course depended at all periods on the covering, tiles, for instance,

Fig. 35.

Fig. 36.

necessitating a sharper pitch than slates. No doubt the Norman roofs, like those of the Roman basilicas, from which they were derived, had level tie-beams. It is difficult to

Fig. 37.

conceive how else they could have stood; but in the succeeding styles, when internal height became an object, these were often omitted, and as the thrust of the roof was enormously increased thereby, it was necessary to build large projecting buttresses to keep up the walls, instead of

using those of the Norman period, which are in fact mere shallow pilasters. The truth is, the buttresses, which were originally intended simply to stiffen the walls, were afterwards enlarged to that extent that they became struts to it (A, A, fig. 42), especially the flying buttresses, which continued the line of the principal rafters down to the ground, making the earth, as it were, the tie-beam. To such a degree was this system carried, that in many continental churches, and in some of our own, of which Henry VII.'s chapel is a known instance, there is literally no support derived from the walls, the windows filling the whole space between buttress and buttress, which last, from their vast mass and projection, sustain both roof and groining.

Fig. 38.

Mediæval roofs may be considered,—1st, As those in which every pair of common rafters is framed together, and forms of itself a separate truss, or, as it was called in those days, a "couple;" 2d, As those with common rafters and trusses framed with collar-beams; 3d, As those with hammer-beams; 4th, As those with tie-beams.

But before going into this subject, we must warn our readers who are accustomed to roofs framed of fir, that the mediæval timbers are almost invariably of oak or some hard wood; so the strength or the scantling of the timber must not be judged by our modern notions. That

Fig. 39.

of oak to fir is assumed by Professor Robison to be as three to two. An inch of oak may be safely subjected to a strain of three tons for every square inch, while fir will bear but two.

The most common form of the first is a simple St An

Roof.

drew's cross, as at fig. 35; a cross and collar, as fig. 36; a collar and struts, as fig. 37; or two collars and struts, as fig. 38. All these are taken from examples of the thirteenth and fourteenth centuries. As has been before explained, these roofs are liable to spread, as there is nothing to tie the plates together, and they are all weak at the point be-

Fig. 40.

tween the end of the brace A, and the top of the ashler-piece B. To obviate this, various contrivances were used;¹ one of the most elegant is the addition of curved braces, which not only strengthened each rafter, but tended to brace the whole together. Fig. 39 is a common example in England, particularly in Somersetshire.

As those roofs with simple couples could not be erected of any great span, they were commonly framed with trusses, purlins, and common rafters; and then the defect of these open roofs became more felt, as each truss had not only to bear its own load, but that

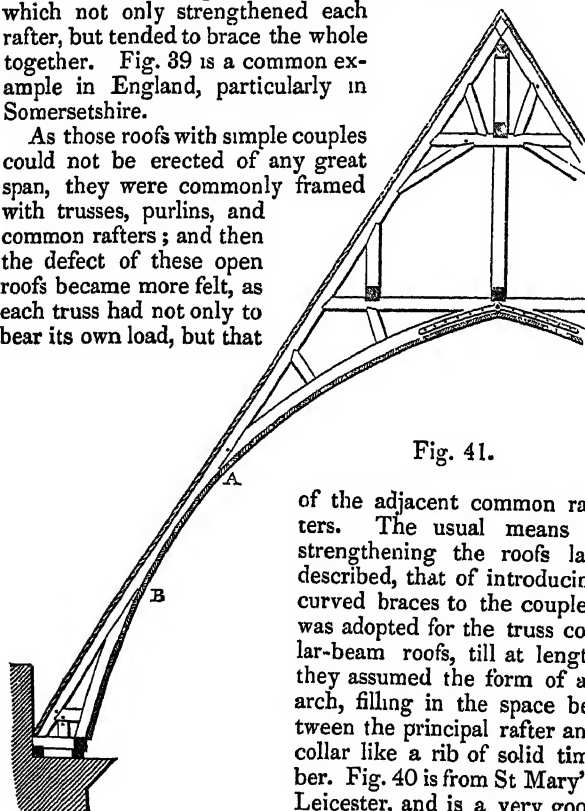

Fig. 41.

of the adjacent common rafters. The usual means of strengthening the roofs last described, that of introducing curved braces to the couples, was adopted for the truss collar-beam roofs, till at length they assumed the form of an arch, filling in the space between the principal rafter and collar like a rib of solid timber. Fig. 40 is from St Mary's, Leicester, and is a very good example. But the most ex-

traordinary mediæval roof, on the principle of a collar-beam and curved braces, is that over the Salle des Pas Perdus at Rouen, which was built in 1493, and is of inconceivable lightness and boldness (see fig. 41). It is 54 feet 5 inches English in span, and covers a hall 155 feet long, the trusses being not quite 4 feet apart. It is close-boarded inside, so

as to show as one long, pointed vault below. The thrust, which is immense, is resisted by walls 6 feet thick, with huge buttresses. The upper part of the construction is very good; but how the part between AB can sustain the weight of the upper part without bending has puzzled everybody. It can, in effect, be only due to the excellence of the workmanship and strength of the materials.

On looking back to fig. 40, it will be seen not only that the curved brace was intended to strengthen the rafters, but also to relieve the thrust by conveying it lower down the wall, and distributing it over a much larger portion of its surface, as well as bringing it more in a line with the

Roof.

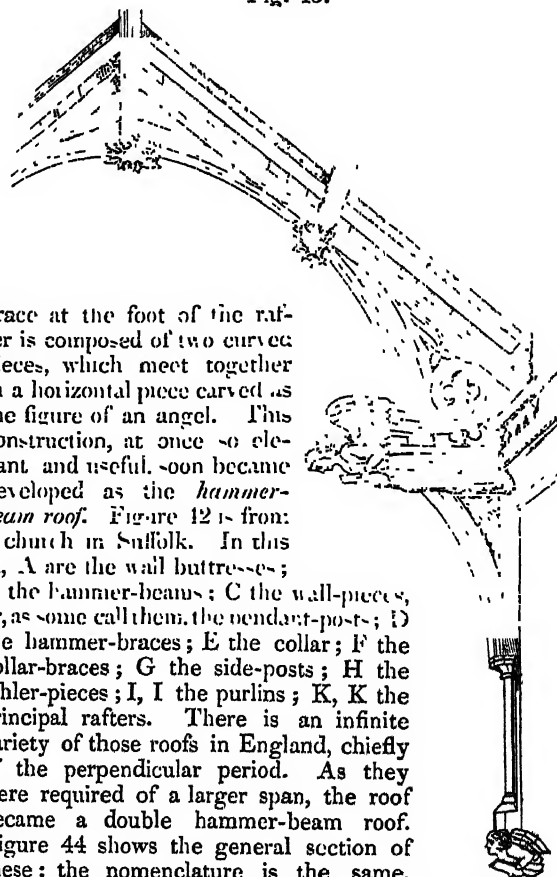

Fig. 42.

buttress AA (fig. 42). Fig. 43 shows the beautiful roof over the church at Wymondham in Norfolk. Here the

Fig. 43.

brace at the foot of the rafter is composed of two curved pieces, which meet together in a horizontal piece carved as the figure of an angel. This construction, at once so elegant and useful, soon became developed as the *hammer-beam roof*. Figure 42 is from a church in Suffolk. In this A, A are the wall buttresses; B the hammer-beams; C the wall-pieces, or, as some call them, the pendant-posts; D the hammer-braces; E the collar; F the collar-braces; G the side-posts; H the ashler-pieces; I, I the purlins; K, K the principal rafters. There is an infinite variety of those roofs in England, chiefly of the perpendicular period. As they were required of a larger span, the roof became a double hammer-beam roof. Figure 44 shows the general section of these: the nomenclature is the same, with the addition that A is the upper hammer-beam, B the upper hammer-brace, and C the upper side-post. Of these,

¹ Most Gothic curved braces are cut out of boughs of large trees bent by nature.

Roof. the most celebrated are those over Westminster Hall, Hampton Court, the palace at Eltham, and very many of our col-

folk. But it was reserved for the perpendicular period to design the most elegant roofs with level tie-beams. These

Roof.

Fig. 44.

lege halls. It will be seen by the section, the use of the hammer-beam framing was to deepen, as it were, the principal rafter, and thereby prevent its bending between the collar and the plate; besides which it got better hold of the wall; but there was nothing to tie the walls together, nor to keep the truss from spreading; the consequence is, in spite of the buttresses, many of these roofs have opened, and the walls have gone over. A very curious roof, and one which is much stronger in point of construction, is that over the Parliament House at Edinburgh, which was begun in 1632. In this roof the pieces which act as hammer-beams are not horizontal but incline, or rather radiate towards a centre; they are filled in with arched pieces bearing pendants, and have a very original and pleasing effect.

The use of *level tie-beams* in roofs is of two kinds: one where the rafters are in couples, and they seem merely introduced to tie the plates together, and probably were inserted afterwards; the other where they form parts of the trusses themselves. In large roofs, we have already an example in fig. 35. In smaller roofs of the fourteenth century, fig. 45 is a very common and pleasing example. From

Fig. 45.

the tie-beam springs a king-post, from which branch four curved struts, one pair serving to support the principal rafters, the other pair doing the same for the ridge. This is called a *tree-post roof*. Figure 46 shows a very curious combination of a level tie-beam and curved struts. It is from the church of St Mary the Virgin at Pulham in Nor-

VOL. XIX.

Fig. 46.

are of infinite variety in design, and are generally filled in with tracery, and ornamented with carving. Figure 47 shows a very beautiful example, that of St Martin's at Leicester. In many instances these roofs are richly adorned with painting and gilding of the most brilliant description.

Another sort of mediæval roof is yet to be noticed, and that is where, instead of timber principals, arches of stone are thrown across from wall to wall, and carry the purlins and common rafters: among these may be named the great hall at Mayfield; but they are of very rare occurrence.

Account of Roofs of Large Span (à grand portées) and some modern Roofs.

For many years the roofs of the basilicas at Rome were the largest spans that had been covered by the carpenter's art; but about three-quarters of a century ago there was a great desire to roof over much larger spaces without internal supports, for the purpose of military and other riding-schools. The vast roof over the *Salle d'Exercice* at Darmstadt, erected by M. Schubknecht in 1771, is 228 feet long and 154 feet in the clear of the walls, or 2 feet more in span than that roof lately erected over the railway station at Lime Street, Liverpool, and was the largest roof in the world till that we are about shortly to describe was erected over the New Street station at Birmingham. It appears to have stood very well, although its construction is certainly not on the best principles. The thickening out of the tie-beam by packing beam after beam, one on the other, must have caused considerable shrinkage; and the struts would be much better if placed the reverse way. This roof attracted considerable attention; and about ten years after its erection the Emperor of Russia, Paul I., happened to travel through Darmstadt, and visited the building. He expressed great astonishment at its vast proportions, and determined on his return that one should be erected at Moscow which should entirely eclipse it in magnitude. Accordingly the design was prepared. This gigantic roof was intended to have covered a hall 852 feet in length, by 308 feet in width from out to out. The walls were double, and formed a system of arcaded galleries round the building about 25 feet in depth; so that the span of the roof in the clear was reduced to about 230 feet. The main support of this roof was the curved rib of three thicknesses of timber, notched on to each other *en crémaillère*. Krafft says it was executed, and was used in 1790 for the exercise of the Cossack cavalry and infantry. But M. de Bütancourt, of whom we shall speak presently, affirms that it never was finished. The dotted lines show a method proposed by Rondelet and Krafft to strengthen this roof and make it effective. The chief defect, however, seems to be, that the

Roof.

principal rafters are too weak, and receive no direct support from the cross struts. The troubles in Russia seem to have caused the matter to drop, till the year 1817, when the Emperor Alexander, being at Moscow, resolved on carrying out a roof that should rival the one at Darmstadt. A great number of designs were prepared, none exceeding spans of from 110 to 115 feet. They were referred to General de Bétancourt, before named, who was then chief director of public roads. After some study, this officer prepared the design of it. It is for a hall 501 feet long and 150 in width, which was executed in the short

outside, to prevent their shifting apart, and are of vast strength, and particularly adapted to rooms where the ceiling is intended to represent a large arch or barrel vault, or

Roof.

Fig. 47.

space of five months. On striking the scaffold, which had supported the roof during its erection, the tie-beams went down about two inches. This depression increased in three months to eight inches, when the tie-beam of the twenty-fourth truss gave way, in consequence of the existence of a large knot. The roof was shored up and strengthened, and afterwards stood perfectly well. In justice to M. Bétancourt, it should be stated that such was the hurry in which the work was done that the greater part of the timbers were cut down and floated on the river only a few days before they

were framed, which was done by 400 carpenters, or rather woodmen, who hewed the wood with axes—they being ignorant of the use of any other tool. The writer of this article has designed a roof for the first-class swimming bath in the Westminster Road. This is on entirely a new principle, being, in fact, the adaptation of the trellis or lattice principle to a roof. The trusses are about 18 feet apart, or nearly double the usual distance. The purlins, however, are prevented from bending by a series of light longitudinal trusses, likewise on the lattice principle. The roof is, in truth, trussed fore and aft, so that no part can move. It is of extraordinary lightness and cheapness, the trusses being so few and the timbers so slender. Its deflection, after receiving the load of slates, skylights, &c., was scarcely perceptible.

(a.) *Roofs Trussed with Curved Timbers.*—These are (a) with timbers side by side, flatwise, the ends breaking joint, or, as the system is called by French writers, “en bois plat.” It is the invention of Philibert de Lorme, a French architect, who published it in 1561, in a work called *Traité sur la Manière de Bien Bâtir, et à Petits Frais*. In this system the rafters are in effect curved ribs, of several thicknesses of timber, nailed side by side, care being taken that the ends do not come in the same place; in other words, that they break joint. The rib then resembles a beam cut out of a crooked limb of a tree, and owes its strength simply to cohesion of the particles. These beams are often used in pairs joined together by cross pieces, which are keyed on the

to domes intended to be covered with lead or other metal. One of the most ingenious adaptations of this principle is at the Hotel Legion d’Honneur at Paris, where it forms a dome, with an inner half-dome or cove which carries a gallery. The roof over the great hall of the Pantheon in Oxford Street is a long vault on this principle, the middle thickness or flitch of each rib being of teak wood. That lately erected over the Surrey Music Hall is also a long vaulted ceiling; but here the main ribs are formed of four thicknesses of 1½-inch deal, 1 foot 3 inches wide at bottom and 1 foot at top, in the middle of which is a rib of rolled ¾ths boiler-plate, 6 inches wide, the whole of which are bolted together. The main ribs are 17 feet apart, between which are two intermediate ribs of slighter construction.

(b.) *Roofs constructed of Timber bent on the flat “en bois plat.”*—This is the reverse of the former system; the boards being bent over a centre, and thickness added upon thickness till the beam is thought strong enough, when the whole is bolted together, care being taken, as in the former system, that the ends of the boards break joint. The difficulty is, to prevent the natural tendency of the wood to spring back to the straight, as well as to counteract the weight of the roof covering, which would cripple the curve either at the haunch or crown, as the pressure might be exercised. In this respect something analogous to the laws of arches will apply to explain the result.

The roof over the great riding-house at Libourne was designed by the celebrated Colonel Emy, and executed in 1826. Every rib is composed of five thicknesses of deal, each nearly 2 inches thick, about 6 inches wide and 40 feet long. The rib is semicircular, the springing about 24 feet from the ground, and the span about 70 feet. The ribs are not only bolted together, but clipped with a sort of stirrup-iron and bolts. From these ribs a number of struts radiate to and support the principal rafters, purlins, &c., and at the same time prevent the rib from being crippled at either the haunch or crown. The worst of this roof is, there is nothing to prevent their spreading at the foot. The consequence is, the wall was not only of unusual thickness (nearly 5 feet), but large buttresses were added to counteract the thrust. The roofs over the Great Northern Railway station at London are of about the same span, and are of similar construction, except that the ribs are of 1½ deal in 16 thicknesses, and the spandrils are filled in with ornamental cast-iron work in form of circles, guilloches, &c., which have a very pretty effect. Like the Libourne

Roof. roof, the thrust was compensated by massive brick-work.

To prevent this last defect, as well as to stiffen the rib at the springing, M. Émy designed the roof for the cavalry school at Saumur. This is intended for a span of upwards of 130 feet. Each truss is composed of two sets of ribs, similar to those before described, kept apart at the foot by a series of trellis, and joining together as one rib about half-way up the curve. Instead of one thick wall, it was intended to carry the ends of the trusses partly on an outer wall, which has strong double pilasters, and partly on one large square pilaster, intended to stand under the inner part of the end of the truss, as shown in the figure given in his work; so that, though the space is available for spectators, and little room is lost, the truss itself has a level bearing 18 feet in width from whence to spring.

But of all roofs ever projected, either in wood or iron, the most gigantic, the most original, and the boldest, is one for another riding-house, also by Colonel Émy. This has a span of 328 feet, or at least half as much again as the largest existing roof in the world,—that at New Street, Birmingham. It is intended to be composed of two ribs similar to those before described, with another intermediate rib carried up about two-thirds of the span, and braced, as shown in the figure. The building was to have been surrounded by an ordinary wall, at right angles to which, under the foot of every truss, was a return wall 50 feet long and 4 feet thick, perforated below with arches to form passages, and to serve for spectators, as in the former instance.

Iron Roofs.

Like most important discoveries, the use of iron in roofs has grown up from the smallest beginnings to the largest and most extraordinary results. From the simple substitution of an iron rod for a king or queen post in a wooden truss, we have attained the art of covering spaces so vast as to throw all other modes of construction into insignificance, so light as to appear the work of fairies rather than of human beings, and yet so strong as to bear their weight with ease, and to resist unshaken and unhurt the action of the roughest wind. The theory of these roofs, however, is just the same as those of timber, allowing only for the difference of weight and power of resistance of the materials. The tie keeps the walls together, the king and queen rods prevent the tie from sagging: all these are in a state of tension; while the struts prevent the rafters from bending, and are in a state of compression. Fig. 48

Fig. 48.

shows the earliest use of iron as the king-post of roofs suited to those of from about 20 to 30 feet span. In Plate CLXIII., CARPENTRY, figs. 38, 40, is shown the method of employing iron as king or queen posts of still larger dimensions. Fig. 49 shows a very convenient method of using iron rods as king-post and tie-beam in a collar-beam roof where height or head-room is of consequence; but this was shortly after superseded by the form fig. 50, the adjustment of the screws, &c., at A being more convenient than at

fig. 49. With large spans, however, the wooden tie-beam continued in use for a long time. One of the best in-

Roof.

Fig. 49.

stances for the time it was executed may be found in the roof over the passenger-station at London Bridge of the

Fig. 50.

Croydon Railway. This roof, which is about 54 feet in span, is constructed with an iron king-post and ten sets of iron queens, with wooden struts. (See fig. 51.) It is, how-

Fig. 51.

Croydon Railway Roof.

ever, somewhat twisted on the face by the winding of the timber. The great fire at the Houses of Parliament, and subsequently at the Royal Exchange, drew attention strongly to the importance of fire-proof roofs; and the first of these structures of any size or importance was designed by Sir Charles Barry for the new palace at Westminster. Fig. 52 shows the section of that over the committee-rooms in the front next to the river. This is entirely of wrought iron, excepting the shoes, by which the ends of the various pieces are connected. The iron is flat bar, simply cut to lengths, and punched to receive the bolts that pass through them and the shoes. They vary in width from 2 to 3½ inches, and in thickness from ¾ths to 1½ths. These light principals are not quite 3 feet apart, and are covered with a species of galvanized iron tile reaching from one to another, hung on a sort of connecting-rod without purlins. It is stated that the sulphurous acid in the smoke of London is already causing serious oxidation, and several methods have already been tried to prevent premature decay. This is to be regretted, as the material is very picturesque in character, as well as light, and not expensive. Some fault at the time was found with the construction of the shoes or connecting-plates, but they stand perfectly well, and there has been no failure. The suspension-rods at each side of the king are a peculiar feature; they not

Roof.

only keep up the tie, but bind the roof together at each intersection.

Fig. 53 shows the roof over the House of Lords. This is

of much larger span, being 45 feet, while the former is 28 feet 3 inches. It is of exactly similar construction, except that the struts, wall-plates, purlins, and bearers are

Roof.

New Houses of Parliament—Roof over North and South Curtains.

of cast-iron, the section of the struts being the form of a cross. The suspension-bars are double. The principals are 7 feet 6 inches apart—more than twice as much as the other roof, which of course necessitates the use of purlins.

Fig. 53.

These carry two common rafters 2 feet 6 inches apart, this being the width of the iron plate or tile with which the roofs are covered.

Much animadversion has been expressed as to these roofs. The nearness of the principals has been criticised, as well as the small subdivision of detail; in fact, we shall shortly show roofs of three times the space with a less number of junctions, the principals of which are very much farther apart: so in this respect they are very much more

economical. But it must be remembered these Gothic roofs are of high pitch, while the others are very flat; and therefore more struts and queens are necessary; and that the distance of the principals was regulated in great measure by the nature of the covering. If we also consider they were the first roofs of the kind, we think they may be regarded with great commendation. The progress of railways caused a great demand for light roofs of every span and length, and the facilities for obtaining rolled T and L

Roof. iron, and the machines invented for punching and rivetting, combined with the fact, that iron was not only the lightest material of its strength, but was at the same time incombustible, brought it day by day into more general use.

The awkwardness of fitting wooden struts to an iron tie-rod suggested the use of cast-iron for that purpose; and a very pretty light roof, first used on the Manchester and Birmingham line, was invented (fig. 54), which has since been

Roof.

Fig. 54.

Engine-House Roof, Manchester Station.

of almost universal adoption for moderate spans. For small spans, a very simple and cheap contrivance was used (fig. 55). It is composed of ordinary wrought-iron tubing: A

the same principle as in fig. 54 is carried out, but to a much larger scale; fig. 57 shows the details of the strut AC, the principal rafter, and tie. This roof, however, is weak

Fig. 55.

is a common tee-piece with right and left screws; the king and tie are thus brought together, the other ends first being put into the fire, and hammered into the form of straps. The considerations before named soon caused the abandonment of the use of wood as principal rafters altogether. Some important roofs were constructed with rafters of cast-iron; but this is a material which, if it gives way, breaks quite suddenly, and without any warning; and by degrees the rolled T iron superseded its use. A very large roof, 87 feet in span, was erected at Paris on the Quai Jemappes,

Fig. 57.

Fig. 56.

over the Providence magazine, as shown in fig. 56, where

between A and B, there being too long a bearing without a strut. It was, however, much improved at Paris at the terminus of the Rouen Railway, where one of a span of 88 feet 6 inches was erected, as shown in fig. 58; while fig. 59 shows the detail of the junction of the ties and struts. The introduction of more struts has much strengthened the principal rafter; but the triangle ABC is too large, and ought to have been subdivided by another strut from B to D, the point C being unfairly loaded, and there being a tendency to sink at the point D. A still larger roof, 97 feet 5 inches in span, was shortly after put

Roof.

up at the terminus of the Strasburg Railway at Paris (fig. 60). This is of an arched form, the principal rafter being a huge circular arc of wrought iron framed on the trellis principle. The top and bottom ribs are of rolled T iron, $3\frac{3}{4}$ inches deep, with a $3\frac{1}{2}$ flange, the web of the metal being $\frac{3}{4}$ th thick. The struts are of cast-iron. The rods which tie this vast structure together are only from $1\frac{3}{8}$ to $1\frac{1}{2}$ inch diameter. The walls which support it are above 40 feet high; and the effect is almost cobweb-like, so slight do the ties appear when viewed from beneath. There is perhaps

a defect in making the centre part of the trussing two parallelograms, which could be easily prevented by the introduc-

Roof.

Fig. 58.

tion of a strut from A to B. The extreme inconvenience of having columns or other internal supports to a railway station, and the success of these large roofs, emboldened our engineers day by day to increase their spans; and in the year 1850 Mr R. Turner of Dublin erected the roof over the great station at Liverpool. This was 374 feet in length, of the enormous span of 153 feet, and of the principle shown in fig. 61. The height of the springing is 25 feet, and to the crown 55 feet. The principals are 21 feet 6 inches apart, and are more like a trussed girder than

the ordinary form of roof. They are composed of a rib or

arc of rolled iron 9 inches deep and $\frac{3}{4}$ th of an inch thick, with top flange $4\frac{1}{2}$ and bottom 3 inches wide; on this is rivetted a plate 10 inches wide and $\frac{1}{4}$ th of an inch thick.

From the springing to the haunches these ribs are strengthened by plates rivetted on both sides. The struts radiate as shown, and are constructed like the ribs, but are only 7 inches in depth.

From strut to strut there are three sets of tie-rods between the two extreme radiating struts, and two between the others, varying from 2 inches to $1\frac{1}{2}$ inch in diameter. The diagonal braces are $1\frac{3}{8}$ inch.

The ends of the principal are secured to a chair of cast-iron, resting partly on cast-iron columns, partly on the walls of the office, and partly on a box-girder. Each purlin is composed of three pieces of T iron. The centre piece runs straight

Fig. 59.

Fig. 60.

Roof of Station, Strasburg Railway, Paris.

from principal to principal, the other two branch off, so as to strut them in three points; besides this, they are crossed by

Roof. diagonal braces; so that the whole roof is trussed fore and aft, and forms one solid mass of framing. The attachments

are made by linking-plates, much like those in fig. 59. The roof is covered partly with corrugated galvanized

Roof.

Fig. 61.

iron of No. 16 guage, and partly with glass, in sheets averaging 12 feet 4 inches by 3 feet 6 inches, and $\frac{3}{8}$ ths of an inch thick.

But this roof, vast as it is, sinks into comparative insignificance by the side of that over the joint station in New Street Birmingham (fig. 62), which was finished

in 1854, and is the largest and lightest in the world. It is about $\frac{1}{4}$ th of a mile in length, and varies from 191 to 212 feet in width, the ground being irregular. It spans at once ten parallel lines of railway, four passenger platforms, and a long carriage road. The principals are 24 feet apart, and are supported on one side by the walls of the offices, and on the other by cast-iron columns 2 feet in diameter, connected together at the top by cast-iron arched girders. The top of these, on which the principals rest, is 33 feet above the rails; the tie-rod has a versed sine of 17 feet, the curved principal is 23 feet deep, and the total height to the top of the louvre is 84 feet. The rib forming the principal rafter is of rolled iron 15 inches deep, and $\frac{1}{4}$ ths of an inch in thickness. In each edge, both at top and bottom, are rivetted two angle irons 6 by 3, which together form two flanges 12 inches wide. All junctions are

Fig. 62.

made to break joint, and have plates rivetted on each side, forming a species of fishes. The tie is a solid rod 4 inches in diameter, and is thickened out at every screw; so that the full diameter of the rod is preserved independent of the thread of the screws, which are right and left handed, and which meet at wrought coupling-boxes. On these the struts and diagonal braces take their seating; this is a cast-iron shoe with the requisite lugs and bolt-holes, and which clips the coupling-box, and is screwed to it from beneath. The diagonals are of $\frac{5}{8}$ ths rolled iron, varying from 5 to 3 inches in width. The struts, twelve in number, are of very original construction. They are vertical, composed of four pieces of angle iron set back to back, as if upon the four corners of a square, and are kept apart by iron crosses to which they are bolted. These crosses are larger in the middle of the strut than at the ends, so as to cause the angle irons to curve out each like a bow, and form a sort of open swelling strut, which is not only very strong, but has a very pleasing effect. At one end these vast ribs are secured to stones let into the wall; at the other, which is over the columns, are sets of plates, one attached to the foot of the ribs, and the other to the girders, between which are a series of

rollers 2 inches in diameter, on which the ribs have play, so as to compensate for contraction or expansion of the metal by change of temperature. The purlins are of wood 6 inches square, and are 10 feet apart, trussed with three-quarters tension-rods. Louvres for ventilation are shown in the figure. A little more than half the roof is covered with rough-rolled fluted glass $\frac{1}{8}$ ths thick, each plate being 6 feet long and 16 inches wide; the other part is covered with galvanized corrugated iron. Some idea of this vast construction may be formed when we are told it comprehends 2 acres of galvanized iron covering, and rather more than 2 acres of glass. This last weighed 115 tons, and the whole iron work 1050 tons. The cost was L.32,274, or about L.19 per square; but iron at that time was exceedingly low in price—more so, in fact, than had ever been known.

A very ingenious roof (fig. 63) has just been erected over the new Royal Italian Opera-House at Covent Garden. It was designed by Mr Edward Barry, and is 90 feet in span, and on the ridge-and-furrow principle. The spans being supported by a series of double-trellis girders 9 feet deep, and 19 feet 6 inches apart from centre to centre,

Rooke. between which are the painting-rooms, carpenters' shops, &c. They are entirely of wrought iron, the ends AB (fig. 63) being, in fact, box-girders for a length of 3 feet 9 inches. A double set of iron trellis is then constructed, as Rooke.

Fig. 63.

Trellis Girder and Roof, Royal Italian Opera.

in fig. 63, 9 feet deep, and 6 inches apart. On the top and bottom of each set, and on both sides (fig. 64, AB), a series of angle iron is rivetted, on the top and bottom of which, again, a plate of flat iron is also rivetted, forming

Fig. 64.

upper and lower compression and tension flanges 1 foot 6 inches wide. The whole may be regarded as a perforated hollow beam 90 feet long, 9 feet deep, and 6 inches in thickness, having, as has before been stated, top and bottom flanges 1 foot 6 inches wide. From each of these rises a light transverse roof 19 feet 6 inches in span, the gutter of which is on the top of the girder. The tie and king are of flat iron, and the struts, rafters, and purlins of T iron, all as shown in fig. 64. At the top are skylights which open

for ventilation; the rest of the roof is covered with slabs of slate. The floor of the painting-rooms is supported by iron bearers (CC, fig. 63), on which rest common joists and the ordinary boarding. The strength is enormous, and the construction has these advantages: It is not only lighter than any known roof, but there is no thrust in the walls; on the contrary, it tends to tie them together, and there is no loss of room, as the interval between each girder forms a fine room 90 feet long, 19 feet wide, and 9 feet high. (A. A.)

ROOKE, SIR GEORGE, *Admiral*, a gallant naval commander, was the son of Sir William Rooke, and was born at his father's seat near Canterbury in 1650. His merit raised him by regular steps to be vice-admiral of the blue, in which station he contributed largely to the gaining of the battle of La Hogue, on the 22d of May 1692. The vice-admiral was rewarded for this important service by a pension of £1000, and he was subsequently made vice-admiral of the red, and had bestowed on him the honour of knighthood. He was in 1694 appointed admiral and commander-in-chief in the Mediterranean. During King William's reign Sir George was twice elected member for Portsmouth; and upon the accession of Queen Anne in 1702, he was constituted "vice-admiral and lieutenant of the admiralty of England, as also lieutenant of the fleets and seas of this kingdom." Upon the declaration of war against France, he was ordered to command a fleet sent against Cadiz; and on his passage home he attacked the Plate fleet, pillaged and destroyed it. For this action Sir George received the thanks of the House of Commons, and was appointed to a seat in the Privy Council. In the spring of the year 1704 Sir George commanded the ships of war which conveyed King Charles III. of Spain to Lis-

bon. In conjunction with Sir Cloudesley Shovel, he attacked Gibraltar in the month of July, when, by the bravery of the English seamen, the place was taken on the 24th,—an action which was conceived and executed in less than a week, though it has since endured sieges of many months' continuance, and more than once baffled the united forces of France and Spain. On the 9th of August of the same year Rooke fell in with the French fleet, which consisted of 52 ships of the line and 24 galleys. After fighting the whole of that autumn day, the enemy wore off to leeward in the evening and escaped. The French lost 3000 men in that bloody engagement, and the English 2000. This brave officer being at last obliged, by the prevalence of party spirit, to quit the service of his country, retired to his seat in Kent, where he spent the remainder of his days as a private gentleman. He was thrice married, and by his second wife left one son. "I do not leave much," said he on his deathbed, "but what I leave was honestly gotten: it never cost a sailor a tear, or the nation a farthing." He died on the 24th of January 1708, in his fifty-eighth year. (See *Life and Glorious Actions of Sir George Rooke, Vice-Admiral of England*, London, 1707).

R O P E.

Rope.

ROPE, a general name for all kinds of cordage, but more correctly applied to such as is above one inch in circumference, the smaller sorts being distinguished by the names of twines, cords, and lines.

The art of twisting into lines and ropes various materials, such as thongs of animal hide, the hairs of animals, tough grasses, and vegetable fibres, is of remote antiquity, and has existed even among the rudest people.

The tarabita or rope-bridge of the Peruvians, and the lasso of the Chilian hunter, are formed by twisting together thongs of ox's hide; and in our own country at the present day ropes for particular purposes are made of horse's hair. The coir-ropes of Ceylon and the Maldiv Islands are made from the fibrous husk of the cocoa-nut; the Manilla rope from the fibres of a species of the wild banana, the *Musa textilis*; and the *Sunn* ropes from those of the *Crotalaria juncea*.

Many other vegetables have fibres of great tenacity, and fitted for the purposes of the rope-maker; but preference is given to those of the *Cannabis sativa*, or cultivated hemp, and the *Linum usitatissimum*, or flax, the fibres of both of which possess in a remarkable degree the essential qualities of flexibility and tenacity. Some idea of the importance of the manufacture under consideration may be obtained from the fact that, in the year ending January 1857, the value of the hemp alone imported into Great Britain and Ireland was L.1,953,444, and the value of the cordage exported was L.246,925.

The fibres of the hemp are first twisted together to form a thread or yarn. Many yarns are then combined by twisting, and form a strand; three strands are in like manner combined, and form what is properly a rope, and technically termed a shroud-laid rope or hawser-laid rope; and three of these ropes may be again combined, forming what is termed a cable-laid rope. The fibres should be so arranged that each in the finished rope shall offer the greatest resistance to its being torn asunder in the direction of its length.

If we take a bundle of fibres, equal in length and strength, and fasten it at the ends, each fibre will, upon a strain being applied to the bundle, bear its proper share of the stress; and the strength of the bundle will evidently be measured by adding together the strength of the separate fibres. But if we twist this bundle so as to form a thread, the strain will no longer be equally distributed among the fibres; for, by the torsion, the external fibres of the bundle will be wound round those that lie nearest to the centre, and, in proportion to their distance from the heart of the bundle and the amount of twist given, will form spirals more or less inclined from the axis of the thread. The external fibres will in consequence be longer than the internal ones, and the greatest share of the strain will be borne by the latter. Further, by the operation of twisting, the fibres in a thread are strained, and, on account of their position, the external ones the most. It is of importance to consider the proper length of the primary fibres, and the degree of torsion that ought to be given in forming them into a thread.

All threads require the fibres to be so fine, and of such a length, that the quantity of fibres used, and the number of turns each has round its axis, shall be so great as to produce the necessary compression amongst them, to prevent them from sliding upon each other. If the thread be small, the fibres must be fine, and may be short; and if the thread be large, then must the fibres be long. If the fibres be long in proportion to the size of thread to be made from them,

less twisting will obviously be necessary to keep them from sliding; and the finer and softer the fibres are, the more may the twist be diminished; for soft fibres enter into closer combination with each other than those that are hard. Long fibres requiring thus less twist than short ones, it has been a standing rule with all theoretical writers, that fibres should always be spun into the thread endlong, and never by their bight or double. Now, in the practice of hand-spinning, the fibres are always spun into the thread by their bights, and never by their ends.

It is certainly an advantage in threads which are to be used merely as such, to secure as great a length of fibre as possible, as any strain tends directly to pull the fibres asunder; and they are retained in their position merely by the compression among the co-fibres, produced by twisting. But many threads are combined in forming strands; new forces are brought into action, and so at every further combination. This will be better explained by the following diagram. Let *aa* be the primary fibres, formed into threads *b*; in each thread the fibres are retained in their position by the compression produced by twisting. Let *bb* be threads twisted together to form a strand. Here the threads mutually compress each other, and the primary fibres of each thread are compressed by the surrounding threads. Let *cc* be strands twisted together to form a hawser-laid rope. In this the compression on the primary fibres is again increased, and so in the next combination, where the three hawser-laid ropes are twisted into the cable-rope *d*.

We may from this deduce, that it is not the length so much as the intrinsic strength of the fibre which fits it for the purpose of the rope-maker; and practice perfectly fixes this position, the ropes made from the short waste fibre of the hemp called tow being by no means so weak when compared with those made from the hemp itself, as theory would lead us to suppose, seeing that these fibres are the shortest and weakest of the material. It may therefore be laid down as a rule, that in the making of ropes it is of greater consequence that the fibres should be strong, soft, and finely hackled, than that they should be of great length.

Let us consider a little more how the twist of the thread is affected by its future combination. The fibres are first twisted in a certain direction to form threads. A collection of these threads is then twisted together to form a strand; and this last twist being in a direction contrary to that of the threads, untwists them to a certain extent.

Had the twist in the first instance been no more than would just have kept the fibres from sliding upon each other, it would now be inadequate to produce that effect. Hence one would think it necessary to provide means to put more twist into the threads as they were being formed into strands, or to put as much more twist into the threads while spinning, as the twisting of the strands abstracts from them; but when these strands are combined to form a hawser-laid rope, the direction of the twist is again the same as that of the threads, and restores to them a certain portion of what they had lost. If, however, three of these hawser-laid ropes are formed into a cable-laid rope, the threads are

Rope.

Fig. 1.

Rope.

again to a certain extent untwisted. The untwisting suffered by the thread in forming the strands is much greater than the subsequent retwisting in forming the rope; and if the thread had been at the first too little twisted, or too soft, as it is termed, it would never make a serviceable rope; and for such ropes as require to be impervious to water, it would be totally unsuitable.

It is, then, on the proper angle of twist in the *combined* threads, and not in the threads when *separate*, that the efficiency of the rope depends; and this can be determined by experiment alone.

When many threads or yarns are combined to form strands, the effects produced on the latter by strains are analogous to those produced on the fibres when formed into threads, and, from the greater size of the component parts, are more apparent.

In the ordinary method of procedure the threads are all stretched to the same length, and then twisted together in a direction contrary to their individual twist. This, by winding the external yarns round those beneath them, shortens the whole mass, and puckers up the yarns nearest the centre, and thus the greatest share of any strain is thrown on the external yarns. It has therefore been considered of primary importance in all inventions intended to improve the making of ropes, to equalize the strain on the yarns in the strands.

Belfour attempted to effect this by shortening the internal yarns in the degree necessary to prevent their puckering up. Now, although the fibres of hemp are not in themselves very extensible, yet the rope formed from them is; and when such an extension takes place in a rope formed by Belfour's method, the strain is thrown entirely upon the internal yarns, which, if the strain be great enough, will break from the centre outwards.

The manner in which the external yarns of a strand lengthen, will be seen at once by fig. 2. Here a is a section of a newly formed strand; a' a section of the same strand after having been used; while $b'c'$ is a part of the surface of the first, on the stretch out; and $b'c'$ a part of the surface of the other. By the straining produced by use, the yarns in a are brought into closer contact, and the diameter of the strand is reduced. If in the strand a , bc represents the angle at which any external yarn is supposed to lie, this, by the reduction of the diameter, will in a' be changed to $b'c'$; and if in a , de represents a heart-yarn, this yarn in a' must stretch to e' , or break, which, as it is very little extensible, it is likely to do. It is of importance to observe, that the breaking of the heart-yarns of a strand in this manner is attended with much greater danger than the breaking of the external yarns, as the injury not only remains concealed, but water can easily penetrate to the core of the strand, which in consequence speedily decays.

It would appear, then, that a certain degree of puckering in the internal yarns of a strand is necessary to compensate for the extension that the superficial yarns undergo by use; and where ropes are made by machinery, it would be perfectly possible to arrange it so that, from the central yarn outwards, every one could be wrought into the strand in due length to allow for the stretching.

The further operations are the forming the strands into hawser-laid ropes, and these again into cable-laid ropes. The many uses to which ropes are applied preclude the possibility of applying specific rules to their manufacture.

Fig. 2.

Some require flexibility, others impenetrability to water; strength may in some be of primary importance, or it may be secondary to other qualities which better adapt the rope for its peculiar purpose. The goodness of the rope depends upon the previous operations; but it must be a standing rule in all the processes, never to make use of so much twist as will impair the strength of the fibre.

To prevent the decay of such ropes as are exposed to continual changes from wet to dry, the yarns forming them are soaked in hot tar previously to their being worked up. It would be well if some other substance than tar could be found suited for this purpose, as it unfortunately happens that ropes lose much of their strength in the operation of tarring; and after having been kept for some time, the loss of strength is progressively increased, and this to a greater extent in hot than in cold climates. M. Duhamel made several experiments on this subject in 1741-1746, and from the results obtained he concludes,

1st, That untarred cordage in constant use is one third more durable than the same cordage when tarred;

2dly, That untarred cordage retains its strength for a longer time when kept in store;

3dly, That untarred cordage resists the ordinary influence of the weather one fourth longer than when it is tarred.

Some experiments were made in 1803 by Mr Chapman, civil engineer, to determine the effects of a new process of washing the tar to free it from the soluble substances contained in it, and for which process he had obtained a patent. Yet although the result of these experiments proved beyond a doubt the superiority of Mr Chapman's method, it is singular that it has never come into use. The same gentleman made some other experiments in 1806-1807, confirmatory of those of M. Duhamel. The result of one series is given in the table below.

Date of Experiment.		Girth in Inches.	Breaking Weight.	Comparative Strength.	Cwts on each Inch of Square of Girth
1806, Oct. 2.	White rope.	2.75	75 cwt.	100	9.9 cwt.
— Oct. 24.	Tarred rope.	2.8	55	73.3	7
1807, May 8.	Same rope...	2.8	41.4	55.2	5.3

We shall now offer a few of the rules which have been given by different authors for computing the strength of ropes.

Mr Tredgold says, "that in a hawser-rope, it may be proved that the strength of the straight fibres of hemp is to the strength of the rope as the radius is to the mean between the square and the cube of the cosine of the angle of twist, when the fibres are all equally extended, and the angle of twist measured at the greatest stretch the rope will endure without fracture. The cosine of the angle under these circumstances is in general about 0.87, and therefore the strength is about 0.708 times the strength of the hemp, or very little exceeding two thirds of its strength; but in most cases the loss of strength will be greater than one third, because the stretching of the different parts is unequal. And in a cable-laid rope, that the strength of the hemp is to that of the cable as the radius is to the mean of the third or fourth power of the cosine of the angle of twist under the same circumstances as before; or, that its strength is to that of the ropes which form it simply as the cosine of the angle of twist. This, in usual cases, will be nearly as eighty-seven to a hundred, that is, there are thirteen parts in every hundred of the strength lost in forming cable-laid ropes."

The following rule is given by Dr Robison for finding the strength of ropes: Multiply the circumference of the rope in inches by itself, and the fifth part of the product will be the number of tons which the rope will carry. Thus, in the experiment of Mr Chapman, the weakest tarred rope

Rope

Rope-making.

broke with two tons, and by our rule we find that it ought to carry with safety one ton eleven hundredweight. The practical rules of the workshop are as follows:—To find the breaking weight of 3-strand hawsers; square the circumference, and divide by 3. To find the breaking weight of 3-strand cables; square the circumference, and divide by 5.

The following rule may also be of use:—To find the weight in pounds of a foot in length of any hempen rope, multiply the square of the circumference in inches by 0.045 for shroud-laid ropes, and by 0.027 for cables. (J. N.)

ROPE-MAKING is the art of combining fibrous materials, by twisting in such a manner as to form a continuous flexible cord.

We have before stated that the fibres used for this purpose are those of flax and hemp; the former for small lines and cords only, and the latter for all kinds of cords, from the smallest to the largest. The preparation and manufacture of hemp and flax into such articles as either are adapted for being the same in both, we mean, in the following sketch of these operations, to speak of hemp as the material made use of. This article we obtain from Riga and St Petersburg, whence it is shipped for our ports in great bundles, weighing, according to quality, from forty-five to sixty-five poods each, the pood being equal to thirty-six pounds avoirdupois. On the arrival of the vessels, these great bundles are cut up, and the hemp is thrown from the hold in small bundles, bound at one end, and weighing each about twelve pounds. These small bundles are termed *heads*; and in this condition the rope-manufacturer gets his raw material.

The fibres of hemp, of a good quality, should be long, fine, and thin; smooth and glossy on the surface; of a yellowish-green colour; and free from spills or small pieces of the boon or woody fibre of the hemp plant, which remains after the operation of breaking; and they should, above all, possess the essential qualities of strength and toughness.

Hemp loses many of its good qualities by lying long in warehouses; and when shipped in a damp state it loses its glossy appearance, becomes what is termed rusted, and is then much weaker, and hard and disagreeable to work.

The operations of the rope-maker are carried on in the following order:—

1st, Hackling the hemp; 2d, Spinning or twisting the fibres into threads or yarns; 3d, Tarring the yarns; 4th, Making the yarn into strands; 5th, Laying or forming the strands into ropes, called hawser-laid ropes; 6th, Laying or forming hawser-laid ropes into cable-laid ropes.

1st, *Hackling*.—To prepare the fibres for the use of the spinner, they are drawn over pronged instruments called hackles, which clear from them the refuse, and split them into different degrees of fineness, to suit the size of thread into which they are to be spun.

Fig. 1 is a representation of a hackle of the largest kind, called a *cag*. Here *aa* is a strong board; and *bb* steel prongs, polished and tapered, and made very sharp at the point.

The prongs of the next size of hackle are smaller and closer set, and so on, diminishing to the finest size, which reduces the fibres to the last degree of tenuity.

The operation of hackling is performed in the following manner. The operator stands at a convenient distance in front of the hackles, which are fixed on a steady bench at a proper height. He then takes a bundle of hemp, and divides it into such portions as he can conveniently grasp. One of these he holds firmly by one end, and draws it over the hackle, beginning with the end of the bunch farthest from

Fig. 1.

his hand, and by repeated operations disentangles and splits the fibres nearly to where he grasps the bunch. He then takes hold of the finished end, and operates on the part which he before had grasped. To facilitate these operations, he from time to time oils the hemp with a little whale-oil. When the hemp is combed out and split as perfectly as the first size of hackle enables the workman to do, he carries it, if it be necessary for the purpose intended, to the next in degree, and so on to the last. The short fibres which are pulled out of the bunch by the hackle, and remain sticking to it, are collected from time to time by the workman, as they impede his progress, and are laid aside. They are afterwards drawn over the hackle to lay the fibres straight, and are, under the name of tow, used in making inferior ropes.

As the workman finishes his handfuls of hemp, he lays them aside in bundles for the spinner.

The operation of hackling would seem to require little skill on the part of the workman; but this is by no means the case, as bad workmanship would convert the greater part of the hemp into tow. Hackling is performed in a house, which ought, for convenience, to be near to where the threads are spun, that the spinners be not put to unnecessary expense of time in getting their stuff.

2dly, *Spinning*.—The place where the operation of spinning is carried on, is one division of a walk or alley termed the rope-walk, and is generally enclosed by walls, and roofed over; and in some places where ropes and twine are made, the building is in two stories, the rope-yarns being spun below, and the twine in the loft above.

The walk for rope-yarns is, according to circumstances, from 600 to 1200 feet long, and the width is regulated by the extent of the business to be carried on. One end of the walk is termed the head or fore-end, and the other the foot or back-end; at both ends the machines for communicating twist to the yarns are erected; and along both sides of the walk, at equal distances, and opposite to each other, are erected posts. Between every pair of posts a rail stretches across the walk, at the height of eight feet above the ground; and along the under side of the rail, hooks are fixed, on which the yarns are hung as they are spun; and to one of the upright posts of each pair a large hook is fastened, on which the yarns are hung when collected together. Fig. 2 shows this arrangement; *aaaa* being the upright posts,

Fig. 2.

bb the rails stretching across the spinning walk, *cc* the hooks for the yarns, and *aa* the large hooks on which the collected mass of yarns is hung. At the head of the walk a stout post is fixed in the ground, and to it the yarns are fastened as they are finished. At the foot of the walk a similar post is fixed for the same purpose. These posts must be at that side of the walk on which the large hooks are fixed.

The walks on which small threads for twines and small cords are spun, have, in place of these rails and hooks, rails about three feet long, let loosely into mortises sunk in the top of upright posts, about three and a half feet above the ground; and along the top of the rail upright pins are fixed, to keep the threads separate.

The spinning machines for rope-yarns consist of two up-

Rope-making.

Rope-making.

right posts, *aaa*, fig. 3, between which the wheel *bb* is hung on its axis *c*. A belt from this wheel passes over and gives motion to a number of small pulleys, called whirls, *ddd*, inserted in a circular arc *ee*, called the head, fixed to the top of the posts. The axis of each of these pulleys is prolonged in front of the head, and bent into a hook, as shown more distinctly at *f*; and on this hook the fibres of hemp are hung to be twisted.

The spinning-wheel for the smaller sorts of threads differs from this chiefly in being smaller, and having the parts slightly modified to suit the diminution of size.

The operation of spinning is conducted as follows. The spinner takes a bundle of hemp of sufficient size to make one or more threads the whole length of the walk; he puts this bundle round his waist, the bight or double being in front, and the ends passing each other at his back; and he secures it in this position by buckling a strap round it, or by fastening it with his apron. He then draws out from the face of his bundle as many fibres as he thinks will make the size of yarn required; the bight of these fibres he hangs on one of the whirl-hooks, and the wheel being now turned by an assistant, it throws twist or turn into the fibres. The spinner having laid a piece of thick woollen cloth in the hollow of his right hand, with the end hanging over his forefinger, grasps with it the fibres he had drawn out, pressing them firmly with his thumb and forefinger, the interposed cloth preserving his fingers from being cut by the fibres as they pass. He now walks backward down the walk, that is, from the head to the foot, the wheel-man all the while turning the wheel just so fast as to keep the turn or twist up to the spinner, of which he is admonished by signs made by the left hand of the latter, or, in complete establishments, by a bell, the cord of which traverses the walk. The aim of the spinner is to regulate the supply of fibres from his bundle in such a manner as to render the thread equal in size throughout. This he does with his left hand, drawing back the fibres as they enter his right hand in too great number, and pulling forward more when the supply is deficient in quantity. He takes care, too, that many ends of fibres do not come together in the same place, and that they so arrange themselves as that the strength of the thread shall be equal throughout. If the spinner slacken his grasp of the fibres with his fore-finger and thumb, the turn will pass his hand, and the thread will be spoiled; and it is necessary not only that the thread be firmly grasped by the thumb and fore-finger, but also by the whole hand, that it may be compressed and moulded into a cylindrical form.

We have hitherto described the operation as performed by one spinner; but as many spinners may work together as there are whirls in the head. Suppose, then, that all the spinners have set on, as the fastening of their threads to the whirls is termed. They proceed together down the walk, and when they are a few paces below the first rail, *b*, fig. 2, every man throws his thread on one of the hooks, and so at each rail, until they arrive at the foot. They then join the ends of every pair of yarns, and hang them over the post already mentioned; and for the convenience of afterwards separating them, the pairs are kept apart in the following manner. A piece of twine is tied by its middle to the first pair, a little in advance of the post; the second pair is then put over the post, and the string is tied

Fig. 3.

over them; and in like manner every pair is tied in. This is called netting. The spinners now set on at the foot or back-end wheel, and spin up the walk. The fore-end wheel-man having unhooked the yarns from the whirls of his wheel, and hung them over the post, and tied them in pairs as at the back-end, proceeds down the walk, collecting the yarns from the hooks of the rails, and laying them in a heap in the large hooks *c*, *c*, fig. 2. When the spinners again spin down the walk, these same operations are performed by the back-end wheel-man. When the collected yarns number about 400, they are coiled up in a haul, and are ready either for tarring, or laying into white ropes. Previous to the haul being taken up for tarring, there is a slight turn put into it to keep it from getting entangled in the tar-kettle. In the government rope-works, by the regulations of 1802, the spinners had to produce, from a bundle of hemp weighing 64 lbs., 18 threads of 170 fathoms each; 400 of such threads constituted a haul, and weighed 12 cwt. 2 qrs, and when tarred 15 cwt.

3dly, Tarring.—The next operation is that of tarring. This is variously performed. Here we shall describe the simplest method of doing it.

The apparatus used in tarring consists of a copper bedded in brickwork with a proper furnace below, and flues around it. The copper is termed the tar-kettle, and at one side of it is erected a strong frame, in which a capstan works.

Fig. 4 shows this arrangement. Here *a* is the kettle; *bb* the frame; *cc* the capstan, which may be turned either by manual labour, or horse or other power; *dd* a truck, on which the haul is being coiled away as it comes from the capstan; and *ee* small rollers by which the haul is supported. In the upright nearest the boiler is fixed the nipper for squeezing the superfluous tar out of the haul. The nipper is drawn to a

Fig. 4.

larger size in fig. 5. Here *aa* is a copper-plate with a hole in it about two and a half inches diameter; above it another plate *bb* slides, and out of its lower edge a semicircular piece is cut, corresponding to the hole in the lower plate, so that by sliding this plate down, the aperture is diminished. A lever *dd* of the second order is fixed at one end to the chain *c*, and presses on a stud fixed on the upper plate, so that by moving the weight on the lever the yarn may be pressed to the degree necessary as it passes through the aperture; and as the tar oozes out of the yarn, it is received and carried back to the kettle by the spout *f*, fig. 4.

Fig. 5.

The tar having been put into the kettle and heated to the proper degree, which is about the temperature of boiling water, and is known to the workman, in the absence of more correct means, by a scum closing over its surface, the

Rope-making.

Rope-making.

superintendent begins to pass through the haul. A rope attached to the capstan is passed through the nippers, and attached to the end of the haul. The haul is then coiled gradually into the kettle, and the capstan is moved round. The haul is thus drawn slowly through the tar, and the superfluous tar squeezed out of it as it passes through the nippers, the superintendent regulating the weight on the lever, so as to produce the required pressure; and the end of the haul, as it comes from the capstan, is coiled away, or reeled upon large reels. In this operation the heat of the tar is the most important point to be attended to. If it be too hot, the yarn will be charred; and if too cold, it will be black, whereas yarn intended to be made into ropes should be of a bright-brown colour. The proper heat is indicated, as was before stated, by a scum closing over the surface of the tar, which takes place at about 212° Fahrenheit. If this scum do not rise, the tar is too cold; and if there be an appearance of ebullition, the tar is too hot.

Attily, Forming Strands.

The yarn is now ready for the next operation, which is the making of the strands. This comes under the head of laying. The place where this and the subsequent operations are carried on is termed the laying-walk; it is generally part of the alley of which the spinning-walk forms a portion, and it may be of such a width as to allow of many ropes being made at one time. The fixtures of this walk consist of tackle-boards and wheels for twisting strands, and stakes and stake-heads for supporting them. The tackle-board for twisting large strands is fixed at the head, and is represented in fig. 6; *aa* strong upright posts, *bb* a plank pierced with holes corresponding to the number of strands in a rope, which is generally three. Through these holes winches, called forelock hooks, work. Fig. 7 is an enlarged section of the board, with a forelock hook in its place; *a* is the handle, *b* a collar working against the board, and *c* the forelock let into an eye in that end of the hook which points down the walk. Fig. 8 is a representation of one of the wheels for twisting smaller strands; *bbb* being pinions with their axes prolonged, and bent into hooks at *b'*; *aa* is the driving-wheel, moved round by the winch *c*, and *dd* is a strong post fixed at the head of the walk, and to which the wheel is attached in such a manner that it can be easily disengaged, and a larger or smaller wheel applied, as the rope may require. Corresponding to every twisting apparatus, at the head there is a row of bearers or stake-heads for sup-

Fig. 6.

Fig. 7.

Fig. 8.

porting the strands when twisting, and extending from the top to the bottom of the walk. These are represented in fig. 9, where *aa* is an upright post, called the stake, firmly fixed, and standing four feet above the ground; and *b* the stake-head, let through a mortise in the upright at a foot below the head of the post. In the stake-head there are upright pins, between which the strands are laid, as seen by the drawing. There are also posts at the head and foot for fastening the yarns to when run out for laying. As twisting the strands shortens them, it is necessary to provide at the foot moveable machines for communicating twist. These are called sledges; the largest are formed as in fig. 10, and the smaller sizes as in fig. 11.

Fig. 9.

Fig. 10.

In fig. 10, *aa* corresponds to the tackle-board, and is called a breast-board; it is bolted to the uprights *bb*, which again are firmly fixed and stayed to the frame *cccc*. The part of the frame behind the uprights is called the tail of the sledge, and on it are laid weights to afford pressure enough to keep the strands stretched. These weights consist of old tar-barrels filled with clay, and are called press-barrels. In laying large ropes, sufficient pressure cannot be obtained by the barrels; and in that case a double block and tackle is used, one end being fastened to a strong bolt behind the sledge, and the other to the tail of the sledge, and with the tackle-fall a turn or two is taken round a post. The smaller sledges (fig. 11) have only one upright post, to which some one of the wheels, similar to fig. 8, is fixed; and they have likewise two trucks to run on.

Fig. 11.

Of the smaller implements used, the first are the tops (fig. 12) for laying the strands into a rope. These consist of conical blocks of wood, of different sizes, having three equidistant grooves along their surface, and pins through them laterally, serving for handles. A piece of soft rope is attached to each handle of the top by its bight, and the ends are used to wrap round the rope in the process of laying. These ropes are called tails. When the top is very large, it requires to be supported on a sledge, as shown in fig. 13; and in that

Fig. 12.

Rope-making.

Rope-making.

case the tails are attached to the sledge. Woolders are stout pins with a rope fastened to one end, and are used to assist the action of the machine in twisting the rope. In addition to the above, there is used in making white ropes a rubber, formed of steel rings interwoven like linked mail; and it is probably from the resemblance that it is termed a mail.

In the operation of laying, the yarn is first warped for the strands. The haul is run out along the bearers of the laying walk, and the number of yarns for the size of rope about to be made is separated from it by means of the netting. The separated yarns are then divided into three equal portions. Each portion is laid in a separate division of the bearers, and hung upon its hooks at the tackle-board and sledge. The sledge is then pulled backwards by the tackle-purchase before described, until the yarns are all stretched tight, and press-barrels are now laid on. When things are in this position the threads are examined, and if any be longer than the others, they are drawn up until every yarn is equally tight. The hooks at each end are now heaved round *in time*, and in a direction contrary to the spinning twist; and each collection of yarns is twisted round its axis, and becomes a strand. The twisting of the strands shortens them, and draws the sledge up the walk.

When the torsion in all the strands is sufficient, or when, in technical language, the strands are full hard, the twisting is stopped. The sledge is then drawn up the walk a small piece to slacken the strands and allow the outer ones to be taken off their hooks and hung on the middle hook. It is again drawn back by the purchase, and the top (fig. 12) is inserted among the strands which will occupy its grooves.

The top is now forced back as near the hook of the sledge as possible, and the workmen at the head again turn their hooks in the same direction as before. As soon as the workmen at the sledge perceive it moving forward, they remove some of the pressure, and begin to turn their hook in a direction contrary to its former motion. The top is by this forced forward, and the three strands closing behind it form the rope. When the top gets far enough from the sledge to admit of their application, the tails are wrapped round the rope, and by their friction they enable the workmen to keep the top from moving forward by jerks, and they also make the rope close better. The care of the topman is to regulate the speed of his top in relation to the twist at both ends, the mean of doing which is simple. He makes a mark across the strands at every bearer previous to putting in the top. If, when the top reaches a bearer, he find the mark above the bearer, then the turning at the fore-end is too fast for the motion of the top; and if below the bearer, then the turning is too slow.

In the case of a very thick rope, the power of the men applied to the hook of the sledge is insufficient of itself to pass the turn up the rope. To aid them, other workmen apply the woolders at necessary intervals between the sledge and the top. The strap of the woolder is wrapped round the rope, and the pin used as a lever to heave round the twist; the workmen at the woolders keeping time in their heaving with those at the hook of the sledge. And in the case of a heavy rope, the top sledge (fig. 13) is made use of to support the top.

The mail is used for white ropes only. When the strands are hardened, and before the top is put in, workmen rub the strands with the mail to smooth down any rough fibres, and give a good surface to the rope.

We have now seen that in the processes described, every step is dependent on the skill of the workmen. In supplying fibres of hemp in due quantity to form the thread, in giving the proper degree of twist to the thread, in giving

Fig. 13.

the strand the degree of hardness required, and in the proper speed of the laying top, the workman has no certain guide; and it is surprising that, although machinery for the improvement of almost every other manufacture had been introduced, no attempt appears to have been made to apply it to the art under consideration, until about 1783, when a machine to supersede the necessity of a rope-ground was invented by a Mr Sylvester; and this invention was followed up by many others. Such of these as have come under our notice are briefly described in the following account of them, arranged according to their dates.

1783. About this time Mr Sylvester's machinery was invented. In it the threads were spun by bobbins and spindles; the three several quantities required for the strands were wound on three separate reels, which turned individually round their axes, and also round a common centre, by which motions the rope was formed; and by the machinery it was further wound up as it was made. This invention was not patented, and was never carried into effect.

1784. In this year a patent was taken out by a Mr Seymour for improvements in rope-making; but the invention consisted in the substitution of animal for human power to drive the ordinary machinery of the rope-work.

1792. In this year the Rev. Edward Cartwright took out a patent for a rope-machine, which he called a cordelier. A part of this machine was adopted by Mr Huddart in a patent taken out by him in 1805.

In the machines of Sylvester and Cartwright the only advantage proposed was the saving of labour. There was no attempt made to improve upon the old defective principles of rope-making; the merit of the first attempt to do this is due to the next inventor.

1793, March 16. John Daniel Belfour, of Elsinour, obtained a patent for machinery "to improve the manufacture of ropes and cordage, by making every yarn employed in the composition thereof bear its proper and equal proportion of the stress." This the patentee proposed to effect by keeping every yarn tight at the time of its being twisted into the strand, so as to prevent its being puckered up in the inside of it. For this purpose the yarns were by machinery wound regularly on separate reels. The reels were suspended in tiers in a square frame on iron spindles on which they could turn freely; and by a contrivance the reels could be made to turn round along with the spindles when required, and motion in a similar direction could be given to all the spindles at the same time. The yarns were spread regularly on the reels by a simple apparatus. When the yarns were so wound upon the reels in the frame, the ends of those on the first or lowest tier of reels were carried down the rope-walk, and dropped into the separators, one of which was placed at every fifteen fathoms or so. These separators consisted of a series of vertical bars, fixed to a frame at their lower end, the upper ends being left free; into the intervals between these bars the yarns were dropped, and the different tiers kept separate by horizontal iron rods passed through holes in the side bars, so as to divide the whole frame into a series of reticulations; and these rods were so contrived as to be withdrawn separately or together. By being passed through these reticulations, the threads would be suspended at equal distances from each other from the top to the bottom of the walk, and, if meant to form one strand, would be hung on the hook which was to give them motion; and on the reels in the frame would be left just so much yarn as the strand should take up in hardening. The strand would then be ready for twisting; and to do this in such a manner as to make every yarn occupy its proper place, Mr Belfour employed an instrument called a top-minor. This was a block of wood formed somewhat like a sugar-loaf, and having inserted round its larger circumference a number of projecting pins. Into the recesses formed by these pins the yarns were inserted, and motion being

Rope-making.

Rope-making.

given to the wheel, the top was moved slowly up the walk by the workman, the reels at the same time giving out the yarns as they were taken up by the twisting. When the workman arrived at the first separator, the iron rods were, by the contrivance already alluded to, at once withdrawn, and the yarns left free, and so the workman proceeded until he arrived at the reel-frame, when the turning or heaving at the hook was stopped, and the strand prevented from untwisting, by being seized in a kind of nipper formed of iron. The ends of the yarns were then unfastened from the reels, and the strand was completed. By increasing the size of the reel-frames and separators, and by using three top-minors fixed to a sledge or otherwise, three strands could at the same time have been formed. The strands formed by this machinery were then laid together into ropes in the ordinary manner.

1793. In April 12th of this year, Mr Richard Fothergill obtained a patent for rope-machinery, embracing the following objects: First, freeing the hemp from its native husk, and fitting it for the subsequent processes; secondly, dressing the hemp, and drawing it out into slivers fit for spinning; thirdly, spinning the hemp; and, fourthly, twisting or making it into ropes or cordage. All these operations required no rope-walk to carry them on. Engravings of the machinery will be found in the fourteenth volume of the second series of the Repertory of Arts.

1793. In April 25th, Mr Joseph Huddart took out a patent for certain improvements in the formation of ropes. His method of registering the strands, in order to acquire an additional degree of strength, by giving the length of the yarns which compose the strand a certain ratio, according to the angle and hardness or compression the rope is intended to be laid with, and thereby acquiring a more equal distribution of the strain upon the yarns than ropes made in the common way, consisted of the following principles: First, by keeping the yarns separate from each other, and drawing them from bobbins which revolve, to keep up the twist whilst the strand is forming; secondly, by passing through a register which divides them by circular shells of holes, the number in each shell being agreeable to the distance from the centre of the strand, and the angle the yarns make with a line parallel to it, and gives them a proper position to enter; thirdly, by a cylindrical tube, which compresses the strand, and maintains a cylindrical figure to its surface; fourthly, by a gauge to determine the angle which the yarns in the outside shell make with a line parallel to the centre of the strand when registering, and according to the angle made by the yarns in this shell, the length of all the yarns in the strand will be determined; lastly, by hardening up the strand, and thereby increasing the angle in the outside shell, which compensates for the stretching of the yarns and compression of the strand.

In this, as in Belfour's invention, the registering apparatus was moved up the rope-walk by the twisting of the strand; but the machine differs from Belfour's in the following particulars. First, in place of the bobbins or reels being fixed in an upright frame, they are placed in horizontal ranges, each range rising higher from the front towards the back part of the machine. Secondly, in place of the separator of Belfour, sets of horizontal rails, notched to receive the yarns, and hung in cleats fixed to upright posts, are placed at regular intervals down the walk, so as to keep the yarns separate the whole length of the strand. Thirdly, in place of Mr Belfour's *top-minor*, a plate pierced with concentric circles of holes is made use of, the circles being about two inches asunder; and behind this plate a smaller plate, pierced with a similar number of holes, is fixed, the holes in the latter plate being so close together as merely to keep the yarns clear of each other. Immediately behind this last plate is fixed a tube made of thin steel, of a spring temper, and in two parts longitudinally;

Rope-making.

the thin edges of the one part overlapping those of the other, and the two parts being compressed by a thong or wire wound round them several times, and fastened to the jaws of an instrument called a heaver. By means of this, the yarns, in passing through the tube, can be compressed by a constant force; and if the yarns be thicker or smaller in different parts of the strand, the tube will expand or contract, to suit the difference of size.

In addition to these, an instrument called a register-gauge is used to measure the angle of twist of the yarns in the strands, with the view to employ the same twist when the strands are formed into a rope. Some of the parts of the machinery above noticed, it will be seen, have been adopted by other inventors, and some of them are still in use.

1797, September 13. At this time Mr William Chapman of Newcastle obtained a first patent for laying, twisting, or making ropes or cordage, of any number of yarns or strands, or any number of threads tarred or untarred, from the size of a cable down to the smallest line formed of more than one thread. The machinery for this purpose was less complicated than those formerly mentioned, but was only capable of forming ropes on the common principle. In the month of January 1798 he obtained a patent for Scotland for further improvements in rope-machinery, and containing the substance of his former one and of another taken out for England on the 6th of March 1798. The inventions embrace the making of ropes either by stationary machines, or by moving machinery on a rope-walk. In the former, the operations of forming the yarns into strands, twisting the strands into a rope, and coiling away the rope, on reels or otherwise, go on at the same time. One of the arrangements of the machinery by which these different operations are carried into effect, is as follows. Three or more discs, according to the number of strands, are placed round a common centre, with their planes inclined to each other in such a manner that their produced axes would meet in a given point. These discs are by the inventor termed strand-tables, and each of them is fixed to a hollow shaft, capable of revolving round its axis; which shaft is called the strand-shaft or upper shaft. These shafts are on the sides of the discs which are inclined to each other. On the opposite sides of the discs yarn-reels are suspended on spindles, on which they can turn freely. The yarns from the reels are passed through the shafts, and by the turning of the discs or strand-tables they are twisted into strands. In a part of the shaft there is a transverse opening to admit of two blocks of hard wood or other matter being applied on each side to press the yarns, and retard their passage through the shafts, so that they may be twisted to the degree required. These blocks are called press-blocks or compressors, and are held together by springs or weights. Instead of blocks the patentee sometimes substitutes rollers moving round their axes, and holding the yarns by their friction. Besides these, the yarns pass through a perforated plate called a yarn-guide.

The strand-tables all move round in one direction, and the strands as they proceed from the shafts are concentrated into a point, over a fixed grooved block, corresponding to the top in the ordinary process. Behind this block the strands are received into a hollow axis, which turns round in a direction contrary to the twist of the strand-tables, and in which the strands are formed into a shroud-laid rope, by being twisted by the apparatus attached to the shaft. This consists of a pair of wheels or sheaves, moving easily on their axes, to admit the rope a free passage, and at the same time compel it to twist equally round with the shaft. These sheaves are grooved in such a manner as to prevent the rope from turning sideways, and are called twisting-sheaves. Instead of the sheaves moving freely on their axes, such a motion may be given to them as, in every revolution of the rope-shaft, which makes one turn

Rope-making.

of the rope, the groove of the sheaves shall move such a space as is equivalent to the length of rope that is designed to be made by every turn. When the rope has passed through these sheaves, it is coiled upon a reel in such a manner as merely to require tying up; but if too unwieldy for reeling, it is coiled on a revolving platform. Such is an outline of the process of making shroud-laid ropes by Mr Chapman's machinery. For cable-laid ropes the same or similar machinery is used, the chief difference being, that in cable-laid ropes the twists are contrary, and the disparity of turns in the strands and rope not so great as in shroud-laid ropes; for which reasons, if the same machine be used, the means must be provided for making the shaft to assume contrary motions, and making them to move in different proportions.

"By the method previously described," says Mr Chapman, "for making a complete rope at one operation, I, during the act of making the strands, unite them into a rope by means of what I then call a rope-shaft, in which they are all concentrated, and receive the twist which forms them into a rope; but I also occasionally omit the concentrating of them, and the subsequent part of the operation, during the making of the strand or strands, and in place of twisting them into a rope, I only draw the strand forward as made, and coil it or them in any manner whatsoever, they in this instance having no rotative motion. The apparatus for drawing them forward is not fixed to the revolving shaft, containing the reel or reels and other necessary appendages, but may be permanent, and receive its motion in any proportion whatever to the revolutions or twists given to the strand by that shaft.

"The principles of making the strand in these two different ways are obviously portions of the process that would, as has been described, make the whole rope at one operation. And these two methods of making the strand, independently of making the complete rope, are reducible to the following principle: That in making a strand simply, one end need only to be twisted, and the other held from turning, but that both be permitted to pass forward, and progressively change place; and that the yarns be, if deemed necessary, so regulated as to come off these reels in such a manner as the part of the strand they come into may require.

"There is a third method of making a strand, compounded of the two preceding, which may be followed, viz. that of using two revolving shafts in place of one; the reels being placed on one of them, and the strand coiling upon the other. These two shafts ought to turn in contrary directions to each other."

The part of the invention in which a common rope-walk is made use of is thus described by the inventor: "At the head of the ropery, or in any other part, I fix upon pins so many reels as will contain all the yarns requisite for a strand, or the given number of strands determined to be made at one time, each reel containing one or more yarns; then in the instance of making three strands, I fix to three different hooks on the foreboard of a sledge, so many yarns, separately concentrating to each other, as are requisite; the yarns being previously passed through the openings of these separate fixed tops or yarn-guides, one opposite to or correspondent with each hook. Before, or on the face, or on the face of each top, toward the sledge, there may or may not be fixed a cylinder, such as I have described, below the laying block at the head of the rope-shaft. The yarns are then to be prevented from passing too easily off their reel, either by a pressure on the reels themselves, or on the yarns in their passage to or upon their separate tops, or in any manner that will permit them to come off as wanted.

"The men are then to heave upon, or turn round, the hooks of the sledge in the usual way; and the only remaining difference consists in the sledge being drawn progressively backwards, as the strand is making, until the

Rope-making.

whole, or any determinate part, of the strand be made. The process of drawing back the sledge may be done in various ways; amongst others, by a rope to a capstan, moved either by a horse or men, according to the strength requisite." When the strands are thus twisted, the rope may be completed in the usual way. Such, then, is a brief outline of the general features of these important inventions of Mr Chapman; but his own specification, with illustrative drawings, will be found in the ninth volume of the first series of the Repertory of Arts.

1798. In this year also Mr Belfour obtained a patent for an improvement on his former machinery; and in 1799 Mr Belfour's machinery was adopted in the government-yards, and the sum of L.4000 was paid to the inventor for his superintendence of the erection of his machine, and the use of his patent.

1798. November 8th, Mr Chapman at this time patented an invention, which was so to regulate the motion of the sledge that for every revolution of the strand it should move backward through the exact length of axis assigned to it, and thus render the twist uniform. The sledge, in this case, travelled backwards on a railroad; and along the whole length of the walk, a rope, called a ground-rope, was laid. This rope was passed in the form of an S round two or more grooved wheels, which were pressed together so as to bind the rope, and having upon their axles toothed wheels connecting them with each other, and with the hooks for twisting the strands, which in this case were driven by one great crank. Thus, when the hooks were driven by the crank to twist the strands, the sledge was also moved backwards by the grooved wheels acting upon the rope; and by changing the connecting toothed wheels the backward motion could be given in any ratio to the twist of the hooks. Besides this, Mr Chapman connected the sledge by a rope to a horse capstan at the foot of the walk; and as the horse's power applied to the capstan could not draw the sledge faster backwards than the ground-rope permitted, the spare power was of course given in aid of the twisting of the strands by means of the wheels which connect that operation with the backward motion.

1798. November 17th, Mr John Curr of Sheffield took a patent for forming flat ropes for the use of mines, &c. "The said flat rope may be formed," says Mr Curr, "by connecting two or more small ropes sideways together, by sewing or stitching, lapping, or interlacing them with thread, or small rope made of hemp, flax, or other fit material, or with brass or iron wire, in such a manner as to prevent their separating from each other, and so as to cause them to exhibit, as nearly as possible, a flat form, or flat pliable rope.

1799. April 30th, Mr Belfour obtained another patent for a further improvement on his invention. This consisted, among other things, in winding a number of yarns, not exceeding four, upon each reel, and forming them, as before, into strands. He farther proposed to spin the hemp after having been tarred; and also to place a spinning-wheel at each end of the rope-walk, to enable the spinners to spin both up and down in the manner now practised. If we mistake not, this method of spinning up and down is mentioned by Duhamel as being in use in his time. However this be, it was, on Mr Belfour's recommendation, adopted in the government rope-works, and, according to the report of Mr Fenwick, the master rope-maker at Chatham, a saving was effected by it to the amount of a sixth part of a day's work to each man.

1799. July 26th, Mr William Chapman, in conjunction with Mr Edward Chapman, took a patent for many improvements in the art; the first of which was for machinery to spin the yarns in such a manner that the fibres of hemp, on entering the thread, were shortened in proportion to their proximity to the axis; and further, that by this machinery, women, children, and invalids could be employed as spinners.

Rope-making.

Although the yarn thus produced was of superior strength to hand-spun yarn, yet, as it was attended with additional cost in the manufacture, the invention was laid aside.

The next part of the invention was in the application of locomotive power to the machinery of the rope-work. Part of this consisted in the application of an endless rope, reaching from end to end of the rope-walk, and moved with considerable speed, to any of the machines, whether stationary like the fore-end wheels, or changing position like the sledges. The application of the endless rope to the sledge was effected by passing a turn round suitable grooved wheels fixed to the sledge, and capable of giving motion to its machinery. By this machinery great advantages were gained, as each revolution of the strands and the rope, and the proper motion of the sledge, were predetermined and fixed by changes of wheels. For this purpose tables were made out to show what wheels were to be used for each kind of rope. Instead of two hundred men, the number usually employed in closing a twenty-one inch cable, fourteen only were required; and they, with the help of the steam-engine, which was only of eight horse power, were able to coil away the rope when made.

1799. In the same month Mr Mitchell obtained a patent for a "method of manufacturing cables, hawsers, or shroud-laid ropes, and other cordage, on scientific principles."

These principles consisted in combining by twisting the integral yarns of a strand, in numbers of two, three, or more, previous to their being formed into the strand, and thereby lessening the strain on the external yarns when ultimately formed into a rope. The strain on the external yarns would doubtless be by this method lessened, but the number of yarns exposed to external injury would, at the same time, be increased. The ropes formed on this principle were by the patentee termed *selvagee cordage*.

1799. August 20th, Mr Huddart took out a patent for an improvement on his apparatus of 1793. In this the registering apparatus, instead of being moved up the walk, was, like Mr Chapman's press-blocks, fixed to the tackle-board, and the machinery for twisting the strands was stationary, and also contained apparatus for winding the strands upon reels as they were formed.

1799. In the same month Mr Grimshaw obtained a patent for improvements in rope-machinery, which consisted, first, in dressing the hemp preparatory to spinning; secondly, in winding up the yarn; thirdly, in preparing the yarns for tarring; and, fourthly, in laying the ropes or cordage. The first step appears to be best entitled to notice. The hemp in this was conducted to rotatory hackles through conical fluted rollers, by which means the hemp was equally mixed.

1800. July 1st, Mr Huddart took another patent for further improvements in the manufacture of cordage. "A considerable expense," says the patentee, "is attached to having the tarred yarns wound upon bobbins; and also the tar, especially when the ropes are laid in cold weather, is not sufficiently incorporated amongst the yarns to render it compact for durability, whether registered or laid in the common way. In order to obviate these inconveniences, I have invented a method of registering the strands of ropes during the operation of tarring the yarns, which may be effected in the following manner. The white yarns must be wound separately on reels or bobbins, and placed upon a frame or otherwise, so that the yarns may be delivered from them with as small and equal a tension as possible, and to pass under rollers, or through holes, or between separating rods of wood or metal, to be guided into the tar, when sufficiently heated in the kettle, and thence to the register, separate from each other, to prevent entanglement, until they enter the tube, which must be placed at the end of the tar-kettle opposite to that where the bobbins of white yarns are placed. The registering tube now acts in a double capacity, viz. in forming the strand fair, as in ordinary

Rope-making.

cases, and in acting as a nipper to squeeze out the superfluous tar. The strands are now twisted as before, and the twisting forces out some more tar, which must be cleared off by making the strand pass through the common adjustable nipper plate."

1801. July 16th, Mr William Hoard obtained a patent for "a portable machine for manufacturing ropes and cordage of any length in a short space, particularly adapted for shipping." This machine consists of separate reels, one containing the full length and number of yarns for a strand, from which reel they are drawn out to such distance as the two reels can conveniently be placed asunder, and are attached to the other, which is then empty, one of the reels being in a sledge or moveable frame. The process then begins by twisting the intermediate length of strand, until the reels have approached to each other the usual proportional space, namely, one fifth. The length of strand thus made is then wound up on the second described reel, and so much is let off from the first reel as to admit of their being at their greatest distance asunder, which process is necessarily continued until the whole strand be made, and wound up on the second reel. Lastly, three strands thus made have their ends united to a fourth reel placed opposite to them at its greatest convenient distance. By these four reels, the process of making the rope is carried on similarly to that of making a strand, except in the use of a top to regulate the progress of the twist of the rope in its approach to the three strand reels.

In 1801, Mr Archibald Thompson of Plough Court, Lombard Street, took out a patent for "certain new or improved machinery, for the purpose of spinning rope yarn and sail-cloth yarn, and for laying and making ropes and cordage." Mr Thompson's invention includes the whole process of spinning, tarring, and laying the cordage. Preparatory to spinning, he draws out the hemp into a long sliver, by different sets of chain hackles, moving with progressively greater speed; and in the end the sliver is spun by a spindle with its pleyer and bobbin into a thread. The threads remain wound up on their bobbins until wanted to be made into a rope, tarred or untarred. The bobbins are then, according to the number of yarns wanted in a strand, placed so as to form two circles of the same diameter, round an open cylinder consisting of three hoops or rings, distant from each other the length of a bobbin, and placed near to one end of a long horizontal axis; and, if the rope be to be tarred, the yarns are led through a ring of a few inches diameter, near that end of the described open cylinder which has the spare length of axis projecting from it. The yarns are then diverged in different degrees, so as to form, when passed longitudinally through an open cylindrical frame of several feet in length, so many different concentric circles round the axis mentioned, as there are different shells or concentric coats of yarns in the strand; and from the further extremity of this last-mentioned cylindrical frame, the yarns are concentrated to one focus at the extremity of the axis, which is there concave, and has an opening through which the yarns pass to the machine which is to twist them into a strand, and draw them forward to be coiled up within itself. At the focal point described, there are nippers to express the tar from the yarns, which is put into them in the following manner, viz. the last-mentioned open cylinder, between the ring from which the yarns enter to it, and the perforation of the axis where they centre and quit it, lies over a tar-kettle, and has a portion of its lower half immersed in the tar, just so far as to imbue either the whole or any portion of the yarns with tar, as may be deemed expedient. This cylinder must, of course, turn round with such a convenient degree of speed as not to let the yarns be drawn off the cylinder before it comes in their rotation to pass through the tar. When the full length of strand is made, the twist of which is principally given by the revo-

Rope-making.

lution of the frame, in which it is progressively wound up during the process of making, the yarns are cut off; and three of these strands, from so many stationary strand frames, each of which has performed the operation last described, revolving only round its own separate axis, are concentrated together, and pass through the axis of one end of a rotatory frame, which twists them into a rope, and coils it up, progressively as made, upon a barrel within the frame.

1801. Mr Cutting of the United States invented a method of making lines and ropes. His machinery was of much the same kind as Sylvester's, Fothergill's, and others already described.

1802. January, a patent was granted to Mr Chapman for his invention of the application of certain substances to the preservation of cordage. This has already been noticed under the head ROPE.

1802. March 9th, a patent was obtained by Messrs Mitchell and Son for further improvements in rope-making, in addition to their patent of 1799. The specification of this patent will be found in the second series of the Repository of Arts (vol. viii. p. 241).

1804. Mr Huddart took out a patent for a machine for manufacturing hemp and flax into yarn. We have seen that in hand-spinning the fibres of hemp are spun into the yarn by their bight or double, but by this invention they were to be spun into the yarn by their end. The spinner, in this case, instead of walking backwards, remained stationary, with the machine containing the apparatus for twisting at a little distance from him. In front of the spinner a table or other support, containing a number of upright pins like those of the hackle, was fixed. This table was made broad enough to hold on it half the length of the article to be spun, while the other end was held by the spinner. The spinner commenced his work by drawing some fibres of the hemp, and making them fast to the hook of a whirl; the machine was then set in motion, and the spinner with his spinning cloth took hold of and compressed the yarn as it was formed. By this means, says Mr Huddart, in his description, the longest hemp or flax may be spun without having its fibres reduced in length; for the pins before mentioned occasion all the fibres to be drawn out to their full respective length, or nearly so, and also prevent irregular drawing of the fibres.

It may not be amiss to mention in this place, that in France a method of spinning fibres by the end instead of the bight had long existed. Instead of the spinner fastening his bundle of hemp round his waist, it was fastened to a distaff by being laid along it and tied at the upper end, and the distaff was fastened by its lower end to the waist, and lay on the left shoulder of the spinner; the lower end of the bundle of hemp thus hung loose, and the fibres were spun into the thread endlong.

M. Duhamel made certain experiments to ascertain what advantage this method had over the usual way of spinning by the bight, and the result did not warrant him in recommending its adoption where the men had been accustomed to the other mode.

1805. October 30th, Mr Huddard took another patent for improvements in the manufacture of large cables and cordage in general. This invention consisted of a machine for twisting into ropes the strands formed by the machinery formerly invented by him, and resembled in some parts the machine of Mr Cartwright, called the cordelier.

In Mr Huddard's machine the three strands were wound on their separate reels, which were hung in frames having a motion round their own axes, so as to give hardening to the strands; and also a motion round a common centre in an opposite direction, in order to combine the strands into a rope. On the end of the axis round which the reels were carried for the last-mentioned purpose, the top was fixed, having in it three holes for the strands, and behind

the top the rope was passed round three whirls, in such a manner as to regulate its tension while twisting.

Rope-making.

1805. November 16th, Mr Curr secured by patent an invention of a method of laying or putting together the strands which form a rope.

The invention consisted, first, in so proportioning the teeth of the wheel at the upper end of the walk which twists the strands, to the teeth of that of the lower end which closes the rope, that the workmen, by keeping time with each other in their heaving round the winches of their respective wheels, would give the proper amount of hardening twist to the strands and closing twist to the rope; and, second, in regulating the motion of the laying-top, by having attached to it the end of a line or wire which is wound on a reel fixed to one of the wheels of the sledge, and made to move with a certain velocity according to the size and intended hardness of the rope.

1806. August 9th, Mr Ralph Walker of Blackwall took out a patent for a new mode of making ropes and cordage, applicable to the making of ropes and cordage of any size.

The machinery for effecting these purposes is on the same principles as many of those already described; but the arrangement of the parts is different, and very ingenious. In place of the reels with their yarns being hung on the face of three revolving discs, as in Mr Chapman's machine, they are arranged on the surface of three cylindrical flyers, and the yarns are carried over rollers in the inside of the cylinders, and conveyed to their axes at one extremity, where they are compressed by passing through a hole. These cylinders, like the discs, revolve round their axes, and twist the yarns at that point of the axis where they pass through; and they also revolve round a common axis, which is the main shaft of the machine. When the strands leave the cylinders they are guided by pulleys to a point in the main shaft, where they are formed into a rope. The patentee also describes a manner of tarring the yarns previously to their being wound upon the reels. In this case the tar in the kettle is heated by steam, and the yarns are passed through the kettle under a large roller which keeps them immersed. Engravings of all the machinery may be found in the Repository of Arts, 2d series, vol. xxvi.

1806. In this year Mr Curr took out a patent for proportioning the number of twists in the yarns to the length, moved by the spinners, so that they might elongate equally on being untwisted in forming the strand. To effect this purpose he had a cord wound upon a barrel attached to the spinning-wheel, and receiving a determinate motion from it; the end of this cord, when the spinners were going to set off, was attached to any one of them, whose speed could thus be regulated by the unwinding of the cord, and the other spinners had to keep pace with him.

1807. October 30th, Messrs Chapman obtained a patent for a method or methods of making a belt or flat band of rope for mining and other purposes. This invention consisted in the combination of two or any greater number of the strands of shroud laid-ropes placed side by side so as to form any determinate breadth of belt or band; and in a locomotive machine for stitching or riveting them together when stretched at full length.

1808. June 25th, Mr S. Gadd took a patent for a method of forming ropes, which consisted in twisting the threads together in pairs, and forming the strands of these doubled threads.

1808. June 28th, Mr John Hall took a patent for regulating the twist of the thread in spinning, by means of an endless band traversing the walk, and moved with a given speed by pulleys fixed on the head of the spinning-wheel. To certain parts of this band marks are attached. When one of these marks is at the wheel, a spinner sets on, and in spinning keeps pace with the motion of the band, as indicated to him by the mark.

1828. September 4th, Mr Robertson took a patent for im-

Rope-making.

provements in the manufacture of hempen rope or cordage. The improvements consist in impregnating the yarns with tannin, by steeping them in an infusion of oak-bark, catechu, sumach, or valonia, previous to their being twisted into cordage.

1832. February 1st, Mr James Lang, flax-dresser, Greenock, obtained a patent for such improvements in the construction of the gill spreading or drawing heads, and roving or spinning frames, as adapted them for the spinning of rope-yarns. Fig. 14 shows a side view, and fig. 15 a top view, of the first drawing or spreading machine; and fig. 16

Fig. 14.

Fig. 15.

Fig. 16.

is a diagram illustrative of its mode of action. The same letters refer to the same parts in all the figures. Here *a* is a portion of a board called the spreading-board. Over the surface of this board an endless band of leather travels, in the direction indicated by the arrow; and on this band the hemp to be operated upon is spread. By the motion of the band the hemp is carried forward until it is taken hold of by the feeding rollers *bb*, by the motion of which it is carried onwards to be acted on by the gills or travelling hackles *ccc*; and the gills are fixed to slips of brass screwed to bars which extend across the machine, as seen in fig. 15. These bars pass through grooves formed in the links of an endless chain, by the motion of which they are carried round; and their ends move in peculiarly formed slits in the framing of the machine, by which they are confined to their proper course. By the gills being made to move faster than the surfaces of the feeding rollers, they pass through the hemp many times in the course of its passage across the space in which it is acted on by them, and they are thus enabled to split and straighten the fibres. The hemp now passes between the drawing rollers *ee*, the surfaces of which can be made to move from forty to sixty times faster than those of the feeding rollers, according to the material to be acted

Rope-making.

on. By them the hemp is drawn into a sliver of a certain state of fineness, and this sliver, after passing through the delivering rollers, falls into the can *g*. When a certain quantity of sliver is delivered into the can, a bell is rung by the machinery; the filled can is then removed by the attendant, and an empty one substituted. The filled cans are then conveyed to the second drawing machine, which differs from the first chiefly in being smaller, in having no spreading-board, and in having a double set of rollers and gills in the width, as will be seen by the top view, fig. 17. The cans

Fig. 17.

containing the slivers from the first drawing machine are placed at the end of this, in such number as may be required, and many slivers are then passed together through each set of feeding rollers. After having been acted on by the gills and the drawing rollers, the slivers may be delivered separately, or they may be combined, as shown in the drawing, by passing through a tray previous to entering the last pair of delivering rollers. The slivers, after having been subjected to a third drawing, in a machine the parts of which are still finer than those of the second machine, are carried to the roving or spinning machine. This machine has feeding rollers, gills, and drawing rollers similar to the drawing machines; but the parts are still finer than those of the last machine. In fig. 18 the spinning apparatus is

Fig. 18.

shown. The slivers, on leaving the drawing rollers, pass into the trumpet-mouthed tubes *aa*. The upper part of these tubes is in two halves, one of which is fixed to the cross rail of the machine, while the other is pressed against it by means of a spring, in such a manner as gently to compress the sliver on entering the tube. The bottom of the tube is set into another tube serving as a socket, and into this last tube discs of felt or cloth are put, through which a slit is made for the reception of the thread, which is thus com-

Rope-making.

pressed and smoothed in the same manner as by the cloth in hand-spinning. From these tubes the threads are led to the flyers *bb* and bobbins *cc*, as in the ordinary spinning apparatus. Any degree of twist and of tension during twisting can be given to the yarn, by making the bobbins take up more or less of it for each revolution of the flyer; and this is simply effected by means of a drag formed of two steel springs fixed to the bobbin-rail. The ends of the springs partly embrace a peculiarly-formed pulley attached to the bottom of the bobbin, and by means of a pinching screw they can be made to bear with a greater or less degree of pressure on this pulley, and, according to the amount of pressure, the motion of the bobbin is in a greater or less degree retarded.

These machines differ from those in common use chiefly in the following particulars: 1st, In the distance between the feeding rollers and drawing rollers being capable of alteration, to suit longer or shorter hemp, by means of the grooves in the framing of the machines, seen in the side view, fig. 14; 2dly, in making the yarn to pass through the compressible tubes and the felt discs, which act in a manner analogous to the cloth in the grasp of the workman in hand-spinning; 3dly, in the power which the manufacturer has in regulating the tension and twist of the yarns while forming, by means of the drag applied to the bobbins.

The yarn produced by this machine is of excellent quality, and is much stronger than hand-spun yarn, as appears from certain experiments made for the purpose of testing them; the result showing, "that the patent-spun yarns are stronger than those of equal grist when spun by hand, and from the best staple or long hemp, by fifty-five per cent."

Mr Lang's machinery has in consequence been adopted by some of the most extensive rope-manufacturers in Great Britain.

1832. August 8th, Mr Crawhall obtained a patent for an improvement in the manufacture of flat rope, such as is used in mines. It will be remembered that in Mr Curr's patent, the method described of forming these bands was by sewing several ropes together side by side; and the improvement of Mr Crawhall consists in adding such wheels to the ordinary rope-work machinery as to enable it to make four ropes of the same size, of the same material, twisted in the same manner, and at the same time. By this equality of the ropes greater strength is insured; and they are put together by sewing or plating, as in the other patents.

1832. September 22d, Mr J. H. Kyan obtained a patent for the application to cordage of his now well-known process of steeping materials in a solution of deuto-chloride of mercury for the purpose of preserving them.

1833. May. Mr Norvel of Newcastle at this time took out a patent for machinery for rope-making. In this machinery the bobbins are, like Mr Walker's, arranged on the surface of cylindrical flyers, and in some of its other parts there is a resemblance to that of Mr Chapman; but there is much that is new, and the general arrangement appears to be excellent.

1838. August 8, a patent was obtained by Mr John Stewart, rope-manufacturer in Glasgow, for machinery for spinning yarn, and forming lines, cords, and ropes.

In figs. 19 and 20 a side and end view of the machine for spinning are exhibited. Here *aaa* is the framing; *bb'*, a fast and loose pulley on the principal shaft; *ccc*, bevel-wheels on the same shaft, gearing into pinions fixed on the frames *ddd*, which run in two bearings, one at the foot, and the other at *eee*, fixed to the rail of the frame; *fff* are sliver-cans with projecting pins for hanging them in the hooks of the frames *dd*, so that any can may be shifted without disturbing the machinery; *gg* is a roller moved by a belt on the principal shaft, round which roller a turn of the thread is taken as it comes from the cans, and the motion of the roller, which may be increased or diminished at plea-

Fig. 19.

Fig. 20.

Rope-making.

sure, draws the thread away from the can more or less rapidly. The action of the machine will now be easily understood. The cans having been filled with sliver at the common drawing-frame, are hung in the hooks of the frames; on motion being communicated to the machine, the frames are turned round, and twist the sliver into a thread; and as it is twisted, it is drawn away by the roller.

An essential part of the machine remains yet to be described. This is the nipper, or apparatus for holding tightly and regulating the twist of the sliver; one of these is fixed to each frame above its upper bearing. Fig. 21 is a section, and fig. 22 a plan, of one of the nippers to a large scale. In it *aa* is a part of one of the frames, *bb* the upper bearing, *cc* the hole through which the sliver passes, *d* a pinching screw to fix the nipper in the top of the frame; the part *e* works through a parallel mortise cut through the part *ff* of the nipper. By turning the nut *gg* the part *ee* is thrust into the mortise, so as to allow the sliver to pass through *cc* with more or less freedom, as may be required. Any irregularity in the thickness of the yarns is provided for by the spring *hh*, which allows *e* to yield a little when a part of the yarn

Fig. 21.

Fig. 22.

receives its twist to convert it into a thread or yarn. When the yarns leave the roller they are wound on bobbins, or made use of in some other manner. The patentee describes a method of putting a slight twist into the slivers before the cans are hung in the frames of this machine. He also describes a modification of the frame, in which, in place of the cans, bobbins may be used; and he describes an apparatus for filling the bobbins. His machinery for forming lines, cords, strands, and ropes is represented in

Rope-making. fig. 23, a vertical, and fig. 24, an horizontal, section. Here *aaa* is the framing; *bbb*, sliver cans, mounted each in its frame *ccc*, which is furnished with a nipper at its upper bearing.

Fig. 23.

Fig. 24.

These can-frames run in brackets *dd*, *d'd'*, fixed upon an upright spindle *ee*; the bottom bracket *dd* is shown in the ground plan as a round plate, and the parts for the pivots of the can-frames to run in are raised upon it partly on each side. The spindle *ee* is made to revolve by means of a bevel-pinion *f* fixed upon it, which pinion gears into a wheel *gg* fixed upon the shaft *hh*. A belt from the pulley communicates motion to the main shaft *hh*, which carries a spur-pinion *k*, gearing into a wheel *l* fixed on the shaft *mm*. Upon this shaft the cone *nn* is fixed, which by a belt drives the cone *o*, running loose upon the main shaft *h*. Upon the large end of this cone the bevel-wheel *p* is either cast or fixed; and this gears into the pinion *q* fixed to the wheel *r*, the teeth of which are in its inner edge. This wheel with its pinion turns on the spindle *ee*, and its teeth gear into spur-pinions *ss*, fixed on the bottom of the can-frames. From the nippers at the top of the can-frame, each sliver is conducted to a separate hole near the top of the spindle *ee*; these holes run upwards in an angular di-

rection from under the bracket *i*, and meet in one which is carried to the top of the spindle, where is fixed a nipper similar to those of the can-frames. The roller *v* is for the purpose of pulling away the strand, cord, or rope, as it is formed; and in this case is made slightly conical, so that by shifting it along its shaft, the speed with which it draws may be varied. The action of the machine will be easily comprehended. By the revolution of the spindle *ee* the can-frames are carried round a common centre; and as they turn they receive a motion, each round its own axis, by means of the wheel *r* and the pinions *ss*. If sliver be put into the cans and carried through their nippers, they will be twisted into yarns between the nippers and the holes in the upright spindle, and by the revolution of the spindle they will be combined so as to form a strand or cord. If in place of slivers strands be used, the result will be a rope. The patentee further describes machinery for the formation of flat ropes, or bands for mines and the like purposes.

Having thus, as far as in our power, given an account of the progressive improvement of the art by the application of machinery, we shall conclude with a description of the most improved forms of machines and apparatus used in laying ropes in the present day.

When the yarns have been spun upon Mr Lang's or other spinning machines, or by hand, they are wound from the bobbins in a haul, upon a large octagonal reel about eight or nine feet diameter: the number of yarns in the haul are, of course, regulated by the conveniences of the manufactory. The haul is then passed from this reel through the tar-kettle, and, after undergoing the action of the nippers, is again wound upon a similar reel. From this reel the yarns are wound singly upon the reels or bobbins to be used in the laying. The bobbins, with their yarns, are then hung in frames, and the further machinery used is an improved form of Mr Chapman's locomotive apparatus. The whole arrangement of these parts will be better understood from the drawings. In the drawings the connection of the different parts with the moving power is not shown. This may be steam, water, or any other power, and may be placed in any convenient situation, so as best to serve all the purposes of the establishment.

Figs. 25 and 26 show the general arrangement of the

Fig. 25.

Fig. 26.

winding apparatus; fig. 25 an end view, and fig. 26 a back view, of a portion of the winding-table. *aa*, reel about eight feet diameter, on which the haul is wound; *bb*, frame containing eight bobbins or reels *ccc*, fastened on vertical spindles *dd*, on the lower end of which the pulleys *ee* are fixed; on the horizontal shaft a corresponding number of pulleys are fixed, to drive those of the vertical shaft by belts. One end of the horizontal shaft carries a fast and loose pulley *g*,

Rope-making.

to which motion is given by a belt from the driving power. The apparatus for spreading the yarns on the reels consists of a rail *h'*, with loops or eyes opposite to each reel: through these eyes the yarns are passed. The rail is supported by two upright rods *h*, *h*, which slide through holes in the brackets *i*, *i*. To these rods the alternating motion is given by a chain connecting them with the lever *k*, which is wrought by the heart-wheel *m*. Figs. 27, 28, 29, show the ar-

Fig. 27.

Fig. 28.

Fig. 29.

angement of the apparatus for twisting the strands, and laying them into a rope. *aa* the reel-frame; *bb* the register-plate, through the concentric circles of holes of which the yarns are put. These holes are seen in the detached front-view of the plate at B. Immediately behind the plate the yarns are passed through the pressure-blocks, one of which is figured detached at C. They are then hung on the hooks of the sledge *cc*. These hooks are on the prolonged axes of pinions driven by a spur-wheel *d*, which again is driven by the mitred wheel *e*. This wheel can be connected with either of the wheels *f* and *g*, by means of a clutch wrought by the lever *h*. On the end of the axes of these mitre-wheels the pinion *k* is fixed, and receives motion from the spur-wheel *l*, fixed on the axis of the gub-wheel *m*. Round the gubs of this wheel a turn of the endless band *nn*, which traverses the walk, is passed, and gives motion to the machinery. On the other end of the gub-wheel axis a pinion *o* is fixed, which drives the spur-wheel *p*. On the middle of the axis of this wheel another gub-wheel is fixed; round it a turn of the ground-rope *q* is passed, and by this the sledge is moved progressively backwards: the wheels of the sledge are flanged, and run upon a railroad *r*. When the endless band is set in motion after the yarns have been hung on the hooks of the sledge, the sledge travels backwards at a rate which may be proportioned to the twist required to be given, by the gubs of the ground-rope wheel being made to shift further from or nearer to its centre, so as to move the sledge through a greater or less space for each revolution of the hooks.

When the sledge has reached the foot of the walk, the strands are hung together on the centre-hook of the wheel, and by means of the lever *h* the motion is reversed; at the same time the yarns are cut over by the tackle-board, and hung on the hooks *s*, *s*, *s*, at the fore end. To these motion is given by the spur-wheels *t*, *t*, the latter of which may be driven either by the pinion *u* and spur-wheel *w*, or directly by the pinion *x*, as a quicker or slower motion is required. To the shaft on which the pinion *x* and spur-wheel *w* are fixed, motion is given by the mitre-wheels *y*, *y*, *y'*, the two latter being fixed to a vertical shaft, which receives its motion from the driving power by the intervention of cones, by which that motion may be regulated.

The end of the ground-rope is wound upon the barrel *z*, by unwinding from which it is slackened so as to allow it to be removed from the gubs of the sledge.

Since the above article was written, some improvements have been introduced in the details of the machinery for rope-making. In the spinning apparatus the screw-gill has for the most part superseded the link-gill, represented in figs. 14 to 18. The gill-bars of the screw-gill are moved forward by their ends being forced into the threads of two parallel screws, one placed at each side of the machine. The pressure on the thread, too, in place of being produced by the apparatus shown in figs. 21 and 22, is now more commonly obtained by a dead weight. This consists of a piece of iron which lies over and presses on the thread, and being hinged at its upper extremity, it rises and falls with the slight variations in its thickness. In winding the bobbins, too, a simpler apparatus than the frame (fig. 26) is used. Each bobbin rests on a roller somewhat shorter than itself, which moves freely within its flanges. The roller revolves, and by friction communicates motion to the bobbin, the axis of which moves in vertical slits, so as to allow it to rise as the yarn accumulates on it. The pressure is said to improve the yarn.

In the laying apparatus (fig. 27) the pressure-block *c* is heated by being inserted into a steam chest substituted for the former solid bar. This is a great improvement, and is due to Mr Swallow, engineer, Liverpool.

In the sledge (figs. 27, 28, and 29) grooved pulleys have been substituted for the gub-wheels, and the change in velocity is produced by various-sized pinions. In place, too, of loading the sledge, any required amount of pressure is produced by a break-wheel fixed on the axis of the ground-rope pulley. This was introduced by Messrs Garnock and Bibby.

Wire-Rope.—The apparatus used in the making of wire-rope is exceedingly simple. The bobbins containing the wire are mounted in frames set in the periphery of a larger frame like a cage. The larger frame revolves round an axis, on the bottom of which is a fixed spur-wheel; and the lower end of the vertical axis of each bobbin-frame carries a spur-wheel gearing into this. There is thus obtained a sun-and-planet motion; the large frame carrying the bobbins round the central axis, and each bobbin-frame revolving also round its own axis. The wires from the bobbins pass through holes in the top of the central axis, and are there united to form the strand or rope as the case may be. The apparatus for small strands or ropes is sometimes arranged so that the bobbins revolve round a horizontal in place of a vertical axis. (J. N.)

Rope-making.

Roque
||
Rosa.

ROQUE, SAN, a town of Spain, Andalucia, in the province and 56 miles S.E. of Cadiz, and 7 N.W. of Gibraltar. It stands on a hill, and consists chiefly of low houses. In the principal square is a town-hall; and the other public buildings are a church and convent, several schools, an hospital, poor-house, and prison. Outside the town is a public walk and a cemetery. Wine, cordage, leather, soap, pottery, &c., are made here, and there is some trade in corn. San Roque was built by the Spaniards in 1704, after their loss of Gibraltar, principally out of the ruins of the ancient Carteia. The climate here is salubrious, and living very cheap. Pop. 7619.

ROREE, or LOHUREE, a town of British India, in Sind, on the left bank of the Indus, 20 miles S.S.E. of Shikarpoor. It occupies a picturesque position on a rocky precipice 40 feet high, round the base of which sweeps the river, here about 1200 yards broad. There are four rocky islets in the stream; and the ruins of some buildings in the centre seem to give countenance to the ancient tradition, that the Indus formerly flowed in a different bed. Roree has narrow streets; and the houses are large and lofty, but not very substantial. There are about forty mosques, the largest of which is a gloomy brick building on a rising ground. The town has also two bazaars, and a large lodging-place for travellers. The manufactures are few and insignificant. Pop. estimated at 8000.

ROSA, SALVATOR, a celebrated landscape-painter, was born at the village of Arenella, in the neighbourhood of Naples, on the 20th of June 1615. His youth was characterised by a wild and self-willed disposition. The desire of his father that he should enter the church had no effect on his conduct. He behaved so rebelliously at the college of the congregation of Somasca that he was expelled. Nothing would satisfy him but to become a painter. When he found himself unable to obtain a proper instructor in that art, he resolved to learn from nature. Setting out alone, he was soon lost among the solitary and romantic scenery of the Bay of Naples. It is even said that he ventured into the den of the bandits of Sant' Angelo, and spent some time in sketching their mountain haunts and their own picturesque features. Nor, on his return to Naples, was he less bold in displaying the artistic skill which he had gained. He painted history after Ribera, and battle-pieces after Aniello Falcone, and assailed with satirical epigrams all those envious rivals who dared to scoff at the first attempts of his genius. Salvator Rosa settled at Rome in 1634, and commenced to practise as a professional landscape-painter. The obscurity and poverty in which for a long time he toiled had an effect upon his genius. His imagination conjured up scarcely any scenes but what were dark and awe-inspiring. Yawning ravines, gloomy thickets, barren wildernesses, and lonely sea-shores, were his favourite subjects. The rocks were rugged and riven; the trees were maimed and dishevelled; the skies were black and troubled; and the figures were lurking bandits, wayworn travellers, solitary anchorites, and castaway mariners. The general effect, indeed, was to give a striking and complete representation of uncultivated and savage nature. Between 1647 and 1657 Rosa was in Florence, enjoying a brilliant career of fame. The grand duke and the courtiers caressed him and heaped favours upon him. Many of the citizens admired his pictures, sung his cantatas, and could repeat parts of his unpublished satires. His house was the resort of all the men of genius and refinement in the place. Among these he appeared in the character of a very prodigy of versatility. He acted comic pieces, recited his own poems, sang his own songs to his own tunes, performed upon every kind of instrument, and discoursed upon every kind of subject. The remaining days of Salvator were spent at Rome in the composition of historical pictures. In these he showed that he could transfer to figures the same gloomy loftiness

which he had imparted to landscape. "Pythagoras on the Sea-shore," "Pythagoras issuing from a Subterranean Cavern," "Jeremiah thrown into a Pit," "The Catilinarian Conspiracy," and "Saul and the Witch of Endor," were terrible and grand. He might even have attained to higher efforts in the same line, had he not been cut off by dropsy on the 15th of March 1673.

Many of Rosa's pictures are in Britain. A large landscape, representing "Mercury and the Woodman," is in the National Gallery. There are also two of his paintings, a landscape and a sea-piece, in the National Gallery of Scotland. The chief biographers of Salvator Rosa are Baldinucci, Passeri, and Pascoli. His *Life and Times* by Lady Morgan is far too romantic and rhetorical to be worthy of its name.

ROSAMOND, daughter of Walter, Lord Clifford, was a young lady of exquisite beauty, and is generally known by the common epithet of "the Fair Rosamond." The popular story of her is as follows:—Henry II. saw her, loved her, declared his passion, and triumphed over her honour. To avoid the jealousy of his queen Elinor, he kept her in a wonderful labyrinth at Woodstock; and by his connection with her had William Longsword, Earl of Salisbury, and Geoffrey, Bishop of Lincoln. On Henry's absence in France, however, on account of a rebellion in that country, the queen found means to discover her; and, though struck with her beauty, she recalled sufficient resentment to poison her. The queen, it is said, discovered her apartment by a thread of silk; but how she came by it is differently related. This story of "Fair Rosamond" was once exceedingly popular in England, and is still heard of through the medium of attractive broadsides in remote districts, where it is eagerly read, and as eagerly believed. Yet it is not supported by history. She was buried in the church of Godstow, opposite to the high altar, where her body remained till it was ordered to be removed, with every mark of disgrace, by Hugh, Bishop of Lincoln, in 1191. She was, however, considered as a saint after her death.

ROSARIO DE CUCUTA, a town of New Granada, in the province of Boyaca, stands in the fertile valley of Cucuta, 30 miles N.N.E. of Pamplona. The surrounding country produces large quantities of cacao, sugar, coffee, and cotton; and an active trade is carried on here in these articles. Pop. 5000.

ROSARY (Lat. *rosarium*, a rose-garden), a string of beads used by Roman Catholics in their devotions, on which they reckon the number of times they repeat the Pater-noster and the Ave Maria. The former, or Lord's Prayer, they recite fifteen times; the latter, or angelical salutation, they recite one hundred and fifty times. Accordingly, the rosary is three times the ordinary chaplet. It is reported to be instituted in honour of the fifteen principal mysteries in our Saviour's life, and that of the Virgin Mary. Some have attributed the origin of the rosary to St Dominic. A Spanish writer tells us "we owe to Dominic de Guzman, a canon of the order of St Augustin, two most important blessings, the rosary and the holy office," A.D. 1202. Mosheim, among others, ascribes to this institution a higher antiquity (*Eccles. Hist.*, cent. x., part ii., c. 4). "Pretty distinct traces," he says, "of the rosary and crown of St Mary, as they are called, or of praying according to a numerical arrangement, are to be found in this (the tenth) century. For they who tell us that St Dominic invented the rosary in the thirteenth century do not bring satisfactory proof of their opinion." "This," he adds in a note, "is formally demonstrated by Mabillon, *Acta Sancti Ord. Bened.*, Præf. ad sæcul. v., p. 58, &c." This festival falls on the first Sunday in October. Its name is said to have been changed by Gregory XIII., from St Mary of the Victory, given to it by Pius V. on its institution in honour of the battle of Lepanto, which took place on that day. (See Brande's *Dict. of Science*.)

Roscius
||
Roscoe.

ROSCIUS, Q., the most celebrated comic actor of Rome, is spoken of in terms of the highest commendation by Cicero. The exact period of his birth is unknown, but he must have been somewhat older than Cicero (born B.C. 106), as he had already earned a high reputation before the death of Sulla, B.C. 78. His subsequent career was said to have been predicted by a strange occurrence whilst he was still a child. His early years were spent at Solonium, near Lanuvium; and whilst he was sleeping in his cradle, a serpent entwined itself round his body without injuring him. This circumstance in the life of the actor was afterwards represented by the artist Praxiteles, and celebrated by the poet Archias. Of his education we know nothing, except that he and Æsopus, the tragic actor, used to attend the Forum when Hortensius the orator pleaded, that they might imitate on the stage what they admired in him. Roscius had a peculiar squint of the eye, but this was of course concealed by the mask he wore. His private character was highly respected, and Cicero remarked that he was such an artist that he seemed the only one fit to appear upon the stage, and yet so excellent a man that acting was beneath his dignity. He thought him worthy of the Senate. He used to contend with Cicero which of them could represent the same sentiment in the greatest variety of ways, he by acting, and Cicero by his eloquence. So high an opinion did he entertain of his profession that he wrote a work comparing it with oratory. He gave lessons in elocution, and used to say that he never had a pupil whom he could altogether approve of. His gains as an actor are variously stated,—by Macrobius at 1000 denarii (L.32, 5s. 10d.) a day; and by Cicero at 600,000 sesterces for ten years (L.48,434 10s.), which would make it somewhat less than L.5000 a year; but for the last ten years he had refused to receive this pension from the Roman people. He had a dispute with one Fannius Chorea respecting a slave of whom they were joint owners, and Roscius was defended by Cicero in a speech which has come partially down to us. At what time this took place we have no means of judging. He died a little before the time (about B.C. 61) that Cicero delivered his oration in defence of Archias. (See Unterholzner, in Savigny's *Zeitschrift*, vol. i., p. 248; also Munchen, *Oratio M. T. C. pro Q. R. C. juridice exposita*, Coloniae, 1829.)

ROSCOE, WILLIAM, a distinguished writer, was born at Liverpool on the 8th of March 1753. He was the only son of William Roscoe, who then kept a public-house called the Bowling-Green, to which he united the profession of a market-gardener. The elder Roscoe is described as a man below the middle stature, but of remarkable bodily strength and activity. His wife, Roscoe's mother, is said to have been a woman of a superior mind and of warm affections, and to have exercised over the character of her son an influence, of which the effects were never obliterated to the latest period of his life. The first elements of learning he acquired under the tuition of a schoolmistress; and at the age of six he was removed to a superior school. Roscoe quitted school at the age of twelve, the master having reported that his scholar had learned all that he professed to teach. He acquired a very early relish for reading, and particularly for poetical reading. "I was at this period of my life," he has recorded, "of a wild, rambling, and unsocial disposition; passing many of my hours in strolling along the shore of the River Mersey, or in fishing, or in taking long walks alone. . . . I now began to assist my father in his agricultural concerns, particularly in his business of cultivating potatoes for sale, of which he every year grew several acres, and which he sold, when produced early in the season, at very advanced prices. His mode of cultivation was entirely by the spade; and when raised early, they were considered in that part of Lancashire as a favourite esculent. When they had at-

tained their proper growth, we were accustomed to carry them to the market on our heads, in large baskets, for sale, where I was generally entrusted with the disposal of them, and soon became a very useful assistant to my father. In this and other laborious occupations, particularly in the care of a garden, in which I took great pleasure, I passed several years of my life, devoting my hours of relaxation to reading my books. This mode of life gave health and vigour to my body, and amusement and instruction to my mind; and to this day I well remember the delicious sleep which succeeded my labours, from which I was again called at an early hour. If I were now asked whom I consider to be the happiest of the human race, I should answer, those who cultivate the earth by their own hands."

Having reached his fifteenth year, he found it expedient to make choice of a profession. His love of reading induced him to prefer the avocation of a bookseller, but he was disappointed in his expectation of finding it altogether pleasant, and after a trial of a month, he returned to his rustic labours. In the course of the ensuing year (1769) he was articled to a young attorney, who died before the completion of his clerkship. The remainder of it was passed in the office of Peter Ellames, who was eminent in his profession, and who was much satisfied with his pupil's talents and industry. During this period he still continued to reside with his father, but he had previously the misfortune to lose his mother. Although very punctual in his attention to business, he always found some precious intervals of leisure for the cultivation of his literary talents; and his early love of poetry had its usual effect in purifying and refining the taste. His chief favourite was Shenstone, with whose elegant simplicity he appears to have been greatly captivated. He cultivated an intimate friendship with other ingenuous youths who cherished the same love of literature. In conjunction with two of these, William Clarke and Richard Lowndes, he applied himself to the study of the ancient languages; and with these individuals, to the close of their lives, he continued in habits of the strictest intimacy. They had another associate, who was capable of directing as well as participating in their studies. This was Francis Holden, a young man of uncommon talents, who was an assistant in his uncle's school, where it was his business to teach, not only mathematics, but likewise the Greek, Latin, Italian, and French languages. They were accustomed to meet early in the morning, and to pursue their classical studies till the hours of business called them to less genial avocations. It was the example of Holden that prompted Roscoe to begin the study of the Italian language, in which he at length attained to so great proficiency. He thus continued to improve his taste and to enlarge his fund of knowledge. From a fervent admiration of poetry there is generally an easy transition to the composition of poems. He wrote many verses in his early youth, and at the age of twenty he printed an *Ode on the Foundation of a Society for the Encouragement of the Arts of Painting and Design*, in the town of Liverpool. About the same period he wrote a descriptive poem, entitled *Mount Pleasant*, which was not, however, published till the year 1777. His ode was then reprinted. These poems were favourably received; and they obtained the approbation of two very competent judges, Mr Mason and Sir Joshua Reynolds.

Having completed his clerkship, he was in 1774 admitted an attorney of the Court of King's Bench. During the same year he entered into partnership with a Mr Bannister, but their connection was of very short duration. He afterwards formed a more permanent engagement with Mr Samuel Aspinall, who had long been known as a respectable practitioner. He was assiduous in his attention to the business of his profession; but he did not find himself con-

Roscoe

Roscoe.

strained to abandon his literary studies, and he thus continued the gradual improvement of his excellent talents. At an early period of his life he became intimately acquainted with the family of a respectable tradesman named Griffies. Jane, the second of three daughters, "soon attracted his admiration, and won his affection, by her gentle yet lively manners, by the sweetness of her disposition, and by the many admirable qualities of her truly feminine mind. Although the state of his circumstances at this time gave little promise of an immediate union with the object of his attachment, it was not the wish, and perhaps it was scarcely in the power, of one possessing the frank and ardent character of Roscoe to conceal from her the feelings she had inspired. From that moment to the close of his long and eventful life, he never found reason to regret for one instant the judgment of his youth." A considerable interval elapsed before they could prudently fulfil their engagement; but his professional emoluments gradually became more ample, and they were married on the 22d of February 1781. Their union was attended with more than common felicity.

The African slave-trade was now in its fullest vigour; and as it formed a very material part of the commerce of Liverpool, the great body of the inhabitants were interested, either directly or indirectly, in the continuance of this detestable traffic. For any individual to raise a warning voice against it in such a community required no small portion of moral courage. The generous feelings and manly character of Roscoe urged him to take a very prominent share in those proceedings which finally led to its suppression; a measure which reflected so much honour on that administration which included Fox, Grey, Holland, and Erskine. He composed, in blank verse, a poem entitled *The Wrongs of Africa*; of which the first part was published in 1787, and the second in 1788. It was translated into German by a clergyman named Kuhn. In 1787 he likewise published *A General View of the African Slave Trade, demonstrating its Injustice and Impolicy, with Hints towards a Bill for its Abolition*. This seasonable tract was followed in 1788 by *A Scriptural Refutation of a Pamphlet lately published by the Rev. Raymond Harris, entitled "Scriptural Researches on the Licitness of the Slave Trade," in four Letters from the Author to a Friend*. Harris was a clergyman of the Established Church, but had been educated for the Popish priesthood. Such talents as he possessed were employed in an attempt to prove that slavery, as a system, has obtained the Divine approval; that God has sanctioned the principle of one portion of mankind treating another like beasts of burden. For his satisfactory refutation of this reverend apologist of such enormities Roscoe received the thanks of the London Abolition Committee. They likewise printed a new edition of his pamphlet, which was extensively circulated, and highly approved. In 1792 he published *An Inquiry into the Causes of the Insurrection of the Negroes in the Island of St Domingo*. Of this insurrection the advocates of slavery had endeavoured to avail themselves, as a most powerful argument against the abolition; and he therefore performed another important service by exposing the fallacies of their reasonings and inferences.

In other public transactions of that eventful period he likewise felt a deep interest. On all subjects his sentiments were humane and liberal. With some of the most enlightened men of the kingdom, he contemplated the French Revolution as a glorious event; and his feelings of exultation were expressed in more than one poetical effusion. In the year 1796 Roscoe published *Strictures on Mr Burke's Two Letters, addressed to a Member of the present Parliament*. At an earlier period (1791), Roscoe had printed a merry ballad concerning *The Life, Death, and Wonderful Achievements of Edmund Burke*; and had adorned it with

VOL. XIX.

Roscoe.

a frontispiece etched by himself, and representing Burke equipped like a knight-errant, and assaulting Fox in the House of Commons. About this period his mind was vigorously devoted to an undertaking of a more important nature. The plan of preparing a biographical account of Lorenzo de' Medici had occurred to him at a very early stage of his literary career. He long continued to collect books and to amass materials; and at the close of the year 1789 he communicated his design to his intimate friend Mr Clarke, who was then residing in Italy for the benefit of a milder climate. This gentleman had been engaged in commercial pursuits, but is said to have been skilled in ancient as well as modern literature. With great alacrity he undertook the task of exploring the archives and libraries of Florence, in quest of materials for the projected work; and the author acknowledged himself deeply indebted to the assistance which he had thus received. The sale of the Crevenna and Pinelli libraries enabled him to procure many rare books, for which he might otherwise have made a hopeless search. *The Life of Lorenzo de' Medici, called the Magnificent*, was at length published in the year 1796, in two volumes quarto. It was elegantly printed by John Maccreery, who, at the author's suggestion, had recently established a press in Liverpool. The success of this publication exceeded the most sanguine expectations which the author could have ventured to cherish. From the periodical critics he obtained ample praise. He received letters of warm commendation from men of rank and men of letters, with several of whom he had no previous acquaintance or correspondence. One of these was the eccentric Earl of Bristol and Bishop of Derry, who was then residing in Rome. He first applied to Mr Cadell, the bookseller, in order to ascertain the author's profession, resources in life, and what present of books, pictures, or statues might be most acceptable to him. Dr Parr's fervent zeal in the cause of literature likewise prompted him to seek the correspondence of the elegant biographer, which ultimately led to an intimate friendship. The first edition of this work was printed at the expense of the author; but soon after its appearance Cadell and Davies offered him no less a sum than L.1200 for the copyright. Of this liberal offer he did not hesitate to accept; and little doubt can be entertained that the booksellers found it a very advantageous transaction. The fourth edition, in three volumes octavo, was printed in 1800. In other countries the success of this book was equally brilliant. Three editions were speedily circulated in America. The work, translated into German by Sprengel, was published at Berlin in 1797. In 1799 a French translation, by Francois Thurot, was published at Paris. During the same year an Italian version, by the Cavaliero Gaetano Mechirini, made its appearance at Pisa, in four volumes octavo. It was undertaken at the suggestion of the elegant Fabroni, who had himself published a Latin Life of Lorenzo, which he intended to translate into his native language; but he was so much delighted with Roscoe's work that he abandoned his design, and recommended the other task to Mechirini. In the course of the ensuing year he addressed a very gratifying letter to the author. Similar letters were addressed to him by Bandini, the learned keeper of the Laurentian Library in Florence, and by the Abate Andres, a Spanish Jesuit, resident in Italy, and deeply skilled in Italian literature.

For the avocation of an attorney Mr Roscoe never had any hearty relish, and he finally relinquished it in the year 1796. With his last partner, Mr Lace, he made an arrangement which secured him some interest in the business; and during the following year he entered himself at Gray's Inn, with the view of being called to the bar. He kept Hilary term, but made no further progress in this new career, although, according to the opinion of his son, he possessed qualities which must in all probability have ren-

Roscoe.

dered his success certain. In conjunction with Mr Thomas Wakefield, he had in 1793 obtained a lease of an extensive tract of peat-moss in the vicinity of Manchester; and from the draining and improvement of this land he anticipated an ample return. In 1799 he purchased one-half of the Allerton estate, a valuable property situated about 6 miles from Liverpool. The family of his intimate friend Mr Clarke, which had long been connected with an extensive banking-house at Liverpool, was at the close of the year 1799 placed in circumstances of considerable difficulty, when by great and unremitting exertions Roscoe brought the affairs of the house into a better train of management; and towards the close of the year 1800 he could again command some portion of leisure for his favourite pursuits. He had previously published *The Nurse, a Poem translated from the Italian of Luigi Tansillo*. This elegant version was favourably received, and it reached a third edition in 1804. But he had for some time contemplated a more magnificent undertaking, a *Life of Leo X.*; and on receiving, through the kindness of Lord Holland, some important and unpublished materials from Florence, he reverted to it with new ardour. *The History of the Life and Pontificate of Leo X.* was published in four volumes quarto in the year 1805. It had been in the press upwards of two years. For one-half of the copyright Cadell and Davies paid the sum of L.2000. This work, notwithstanding its great and varied merit, experienced a less favourable reception than its precursor. The *Life of Leo*, with the omission of the documents contained in the appendix, was speedily reprinted at Philadelphia; but the sale was not there so rapid as that of his former work. A German translation, by Professor Glaser, was published at Leipsic in three volumes octavo, which successively appeared in 1806, 1807, and 1808. A preface, notes, and disquisitions were contributed by Henke. In 1808 a French translation, by P. F. Henry, was published at Paris, and a corrected edition appeared in 1813. An Italian version was subsequently undertaken by Count Luigi Bossi, who began by translating from the French. This work extended to twelve volumes octavo, published at Milan in 1816 and 1817. He added a variety of notes and documents illustrative of the text, together with numerous engravings of portraits and medals. The sovereign pontiff Leo XII. inserted this translation in the catalogue of prohibited books; but in spite of his denunciation 2800 copies of it have been dispersed in Italy, where the name of the elegant author continues to be held in no common estimation.

Soon after the appearance of his great work he was suddenly induced to place himself in a new sphere of action. On the eve of the general election in 1806 he received a requisition from a number of the most respectable burgesses of Liverpool, requesting him to come forward as a candidate for the representation of his native town. This requisition he received on the 30th of October; he issued his address to the electors on the following day; and the election commenced on the first of November. His two opponents were General Gascoigne and General Tarleton; of whom the former had represented the borough for ten, and the latter for sixteen years. They were both Tories, but with this difference, that Tarleton was a deserter from the Whigs. They were both supported by the corporation; but after a very strenuous contest of seven days, the election terminated in favour of Roscoe, who had nearly two hundred votes over Tarleton, and thirteen over Gascoigne. Of the House of Commons he was not a silent member. He took a respectable share in various debates; and he had the high satisfaction of raising his voice in favour of the abolition of the slave-trade.

On the dissolution of Parliament in 1807 Roscoe returned to Liverpool in the month of May, and resolved to

decline again entering Parliament. In 1808 he published *Considerations on the Causes, Objects, and Consequences of the Present War, and on the Expediency or the Danger of Peace with France*. This was an able as well as a seasonable publication; but we cannot add that it produced any extensive or speedy effects. It was soon followed by *Remarks on the Proposals made to Great Britain for Opening Negotiations for Peace, in the year 1807*. The several tracts which he had published on such topics were in 1810 collected into a volume, bearing the title of *Occasional Tracts Relative to the War*. This collection, which includes several tracts that have not been enumerated, remains a monument of his wisdom in the midst of the general frenzy which then prevailed. In 1812 he published *A Review of the Speeches of the Right Hon. George Canning on the late Election for Liverpool, so far as they relate to the Questions of Peace and Reform*. Roscoe was an able and enlightened advocate of parliamentary reform, as of all other attempts to improve the general welfare. The commercial pressure, caused partly by the cessation of the war, and also by the enormous increase of the national debt, told unfavourably on the banking-house with which Roscoe was connected. After struggling for a few days in the vain hope of supporting their credit, the directors were, on the 25th of January 1816, reduced to the necessity of suspending their payments. A committee appointed by the creditors reported that, after the liquidation of the debts, there would remain a surplus of L.61,144. The bank was never shut; and the house was allowed six years for discharging all the debts, with interest. Roscoe undertook the management of its affairs, and exerted himself with surprising energy. One of the greatest trials which he sustained was the necessity of parting with his library, pictures, and other works of art, the valuable and cherished accumulation of nearly half a century. The auction of his library, which was sold by Winstanley of Liverpool, extended to fourteen days, commencing with the 19th of August 1816. It included rare and precious works in several departments, but was particularly rich in Italian literature. The sale of the books was immediately followed by that of the prints, which occupied eleven days, and, being divided into 1352 lots, produced the sum of L.1915, 1s. The drawings, consisting of 610 lots, and the paintings, of 156, were sold for L.2825, 19s.

In the midst of these vicissitudes and trials, which he endured with exemplary fortitude, he still retained his love of literature. In the establishment of the Royal Institution of Liverpool he lent his effective aid. A plan for such an institution had in 1813 been written by Dr Traill, now (1859) professor of Medical Jurisprudence in the university of Edinburgh. The scheme was at length brought towards maturity; and, after an interval of four years, Roscoe, as chairman of a committee, prepared an explanatory report. He was induced, though not without considerable difficulty, to compose and to deliver the inaugural address at the opening of the institution. The attendance was very numerous, and he received the most gratifying applause. On the ensuing day he was requested by the committee to publish his discourse, and it accordingly appeared under the subsequent title: *On the Origin and Vicissitudes of Literature, Science, and Art, and their Influence on the present State of Society, a Discourse delivered on the Opening of the Liverpool Royal Institution, 25th November 1817*. In 1819 he published his *Observations on Penal Jurisprudence and the Reformation of Offenders*. In 1822 appeared his *Additional Observations* on the same subject; and a third part followed in 1825. He afterwards published two tracts on the penitentiary discipline of the United States. In all his literary undertakings he aimed at improving the morals and increasing the happiness of mankind.

Roscoe.

Roscoe.

Roscoe having now withdrawn from business, he seems to have placed his chief reliance on the remuneration of his literary labours. Some of his friends privately raised the sum of £2500, and vested it in trustees for the benefit of himself and his family. "The office of communicating to him this kind and liberal act on the part of his friends was confided to Dr Traill, who, by his judicious representations and affectionate remonstrances, succeeded in removing from the mind of Mr Roscoe the objections which he felt to incur obligations of so serious a nature." About this period he found a pleasing employment in arranging and improving the library of Mr Coke, afterwards Earl of Leicester, and in preparing a catalogue of the numerous manuscripts. His visits to Holkham were rendered peculiarly pleasant; and this gentleman, as we are informed, "conferred upon him obligations of no ordinary nature." His literary ardour was still unabated; and in 1822 he published an octavo volume, under the title of *Illustrations, Historical and Critical, of the Life of Lorenzo de' Medici, called the Magnificent, with an Appendix of original and other Documents*. An Italian version, exclusive of the appendix, was published at Florence by Pecchioli in the course of the following year. In 1822 he likewise published a *Memoir of Richard Roberts Jones of Aberdaron, in the county of Carnarvon, in North Wales, exhibiting a remarkable instance of a partial power and cultivation of intellect*. This extraordinary character, who was originally a fisher-lad, "continues to display a love of learning and an extent of erudition seldom exhibited within the walls of schools or universities, united with a want of common-sense amounting almost to idiocy, and a squalor and wretchedness of appearance of which a common mendicant would be ashamed." At Allerton, Jones had a conversation with Dr Parr on languages, oriental and occidental; and on being afterwards asked his opinion of the learned stranger, he replied, "He is less ignorant than most men."

During this year he quitted his residence in Liverpool, and took a house in Lodge Lane, Toxteth Park, about a mile from the town. Two years afterwards he had the severe misfortune to lose the excellent and cherished partner of all his joys and sorrows. She died on the 24th of September 1824. In the early part of the year he had been elected an honorary associate of the Royal Society of Literature; and after an interval of a few months he was appointed an associate of the first class. In 1827 the great gold medal of the society was awarded to him for his merits as a historian. From other learned associations he obtained various honours; nor must we omit to state that, during the same year, he was elected a corresponding member of the *Accademia della Crusca*.

In the spring of 1821 he had been engaged by the London booksellers to undertake a new edition of the works of Pope. It appeared in 1824, in ten volumes octavo. He contributed a copious and elegant Life of the author, and to a selection of the notes of former editors added a few of his own. Of the character of Pope, both as a man and as a poet, he formed a more favourable estimate than either Dr Warton or Mr Bowles. Those who deny, or reluctantly concede, to Pope the name of a poet, seem to judge according to a very arbitrary standard. A few months after the appearance of this edition Bowles published *A Final Appeal to the Literary Public relative to Pope*, in Reply to certain Observations of Mr Roscoe in his Edition of that Poet's Works; to which are added, some Remarks on Lord Byron's Conversations, so far as they relate to the same subject and the Author; in Letters to a Literary Friend. To this publication Roscoe speedily replied in *A Letter to the Rev. W. Lisle Bowles, Prebendary of Sarum, &c.* His edition, as well as his Letter, obtained a favourable notice in the *Quarterly Review* for October 1825; and Bowles was induced to publish *Lessons in Criticism to William*

Roscoe, F.R.S., &c. These lessons in criticism were not very satisfactory to the public, and Roscoe wisely desisted from any further controversy.

In 1827 he published an edition of the *Life of Lorenzo* in two, and of the *History of Leo* in four, volumes octavo. He had now reached an advanced period of life, and had begun to feel the pressure of age. Towards the close of this year he was suddenly attacked with paralysis, which affected one side of his face, and deprived him of the use of one hand; but medical aid was promptly procured, and he recovered the use of his hand, as well as of his speech. Botany had been among the number of his favourite pursuits. He had been a contributor to the *Transactions of the Linnean Society*, and was regarded as no mean proficient in this science. After his recovery from the paralytic attack, he published the fifteenth and concluding number of a splendid volume on *Monandrian Plants*. Towards the end of June 1831 he experienced a severe attack of influenza; and, after he seemed to be recovering, he was on the 27th of that month seized with a violent fit of shivering, accompanied with almost total prostration of strength. The near approach of death he contemplated with calm resignation to the will of God. On the 30th he closed his mortal career, after having completed the seventy-eighth year of his age. The proximate cause of his death was an effusion into the chest. His remains were interred in the burying-ground of the Unitarian chapel in Renshaw Street.

Dr Traill, the friend and physician of this eminent man, speaks of him in the following terms:—"In person, Mr Roscoe was tall and rather slender. In early life he possessed much bodily activity. His hair was light auburn, almost inclining to red; his full grey eye was clear mild; his face expressive and cheerful. As he advanced in life the benevolent expression of his countenance remained, but the vivacity of the features was tempered into a noble dignity, which it was impossible to see without respect and admiration; while the mouth bespoke taste and feeling, and the clustering hoary hair round his temples gave a venerable air to his manly features. . . . Of the qualities of his heart, as a private individual, it is impossible to speak too highly. In the relations of husband, father, and friend, his conduct was most exemplary; and it would be difficult to point out a man who possessed the fascination of manner which attracts and rivets attention in a higher degree than William Roscoe." (*Edin. New Phil. Journ.*, vol. XIII.)

Three of Roscoe's sons have secured a respectable place in literature. HENRY, author of the *Life of William Roscoe*, London, 2 vols. 8vo, 1833, was a barrister, and author of several legal works, besides having written the *Lives of Eminent Lawyers* for Lardner's *Cyclopædia*. He died at the early age of 37, on the 25th March 1836. ROBERT, who was likewise a member of the legal profession, wrote some pleasing poems. He died in December 1850, aged 60. THOMAS, who still (May 1859) survives, has likewise written very extensively. Besides poems, tales, tours, and translations, he has published an excellent English version of Sismondi's *Historical View of the History of the South of Europe*, and of Lanzi's *History of Painting*.

ROSCOMMON, an inland county in the province of Connaught, situated on the western bank of the great river Shannon, and nearly in the centre of Ireland. It is bounded on the N. by the county of Sligo; on the E. by Leitrim, Longford, and Westmeath; on the S.E. by the King's County; on the S.W. by Galway; and on the W. by the same county and by Mayo. About two-thirds of the boundaries of the county are defined by water, the eastern side being entirely formed by the Shannon and its extensive lakes; and although the extreme length of the county

Roscom-
mon.

Roscom-
mon.

from north to south does not exceed 60 statute miles, yet double that extent may be assigned to the frontier-line, if all the windings of the river, and all the sinuosities of the shores of the lake, are taken into account. It extends over a surface of 607,691 acres; of which 440,522 are arable, 130,299 uncultivated, mountain, or bog, 6732 in plantations, 768 occupied by towns or villages, and 29,370 under water. Of the uncultivated land, it is probable that 40,000 acres might be advantageously improved and cultivated, 80,000 acres might be drained for pasture, and 10,000 acres must remain unimprovable. According to Ptolemy, it was inhabited by the Auteri; afterwards the tribes or septa of the O'Conors, O'Kellys, M'Dermotts, O'Flanegans, O'Flyns, and O'Hanlys, were the chief possessors of it. Shortly after the arrival of the English in the reign of Henry II. it was seized upon by the new settlers, and their maintenance of it secured by the erection of several fortresses. For a long period afterwards the whole province was considered as consisting but of two counties, that of Roscommon being one, and all the remainder, with the county of Clare included, the other, under the name of the county of Connaught. This arrangement continued until the beginning of the reign of Elizabeth, when the whole province underwent a new classification, and the county of Roscommon was divided into the baronies of Athlone, Ballintober, Boyle, Moycarnon, and Roscommon. At the close of the war of 1641 nearly all the former proprietors were dispossessed for having espoused the royal cause, and their possessions transferred to the republican adventurers and soldiers; since which period that branch of the O'Connor family, once sovereigns of all Ireland, now known by the name of the O'Connor Don, is the only one of the former proprietors who holds any part of ancestral possessions in the country. The county is now divided into nine baronies,—Athlone, Ballintober (North and South), Ballymoe, Boyle, Castleroa, Frenchpark, Moycarn, and Roscommon; and subdivided into fifty-three parishes, and four parts of parishes, the remaining parts of which are in some of the adjoining counties. According to the ecclesiastical arrangements of the country, Roscommon contains fifty-seven parishes, of which fifty-one are in the diocese of Elphin, the remainder being in Tuam, Clonfert, and Ardagh. The bishopric of Elphin was suppressed, and the revenues vested in the Board of Ecclesiastical Commissioners by the Church Temporalities Act. The spiritual jurisdiction is exercised by the Bishop of Kilmore, Elphin, and Ardagh.

Roscommon is in shape long and narrow, extending sixty miles in a northern and southern direction, whilst its breadth from east to west, where greatest, is but thirty-two miles; and it decreases gradually until it terminates in a point in its southern extremity. The greatest part of the county is level, forming the western portion of the central flötz limestone field of Ireland; varied, however, by frequent inconsiderable elevations, and by long low ridges or escars formed of limestone gravel. In the north the country rises into rugged mountains, with abrupt, precipitous sides and flattened summits, the highest of which, Bracklieve and Slieve Corkagh, are upwards of 1000 feet above the level of the sea. The equally wild though less elevated range of the Curlew Mountains also forms part of the northern boundary. The great sandstone ridge of Slieve Bawn range along the middle part of the eastern boundary. Slieve Aluyn, in the west, rises to nearly 500 feet in height. No large river passes through the county, but both its eastern and western limits are watered by navigable streams. Along the whole length of the eastern side the Shannon rolls its immense volume of waters; and on the west the Suck, which is navigable for barges to Ballinasloe, unites with the Shannon at the extreme south point. The rivers in the interior, which are small and insignificant, are all tributaries to one or other of these main channels, chiefly

to the former, discharging themselves into their streams, either directly or through the medium of some of the numerous lakes dispersed throughout various parts. Of these smaller rivers, the Arigna, the Fiorish, and the Gara or Boyle river, are tributaries to the Shannon; the Bresgue and the Lung, the latter of which flows through a subterranean channel during part of its course, discharge their contents into Lough Gaia. The most remarkable of the lakes, both for size and beauty, is Lough Kea, in the northern part, near the town of Boyle, from which place it also takes a name, as likewise that of Rockingham Lake, from the seat of Lord Lorton upon its shore. It is about 3 miles in length by 2 in breadth, and studded with several picturesque islands, amongst which Trinity Island is noted for its monastic ruins, and Castle Island for an ancient fortress of the M'Dermotts, now modernized into an elegant villa. The lake derives its supply from the neighbouring boundary lake of Lough Gara, upon the borders of Sligo, which, though larger, and still more irregular in its outline, is less attractive in appearance than that on which it bestows its redundant waters. To the north of Lough Kea the two smaller lakes, Lough Skeen and Lough Meelagh, are connected by a short channel with the Shannon. The lakes of Bodanig, Boffin, and Reagh, on its eastern side, which are, strictly speaking, expansions of the Shannon, may also be considered as partially belonging to the county. The principal of the smaller lakes are Loughs Errit, Glynn, Funcheon, and Aluyn. There are several extensive furloughs or winter lakes, which, being generally dry in summer, afford rich pasturage for sheep. Between Frenchpark and Elphin, that of Mantua covers 700 acres; another, near Lough Glynn, in the extreme west of the county, is half a mile in length.

The limestone, which forms the base of all the level districts, is of various kinds; some gray, containing numerous fossil remains, chiefly madrepores; some of the formation called calp, which is often found blended with layers of Lydian stone; and some black, being susceptible of a high polish, as is a light gray marble found in the southern parts. Sandstone shows itself in the eminences that protrude through the limestone. Slieve Bawn is mostly composed of it; and in the neighbourhood of Frenchpark it is raised in laminæ so thin as to be use for the covering of roofs. The northern district is of the coal formation, which extends also into the adjoining county of Leitrim; but the principal stores of this most valuable mineral, and of ironstone, are to be found on the Roscommon side. The entire area, which is divided into two parts by the Arigna, extends over 6500 acres, of which 2000 are to the north, and 4500 to the south of that river. The strata of coal rise into the mountains of Bracklieve and Slieve Corkagh, where the outcrop may be distinctly seen in several places in the precipitous sides of the declivities. The coal is of the blazing or bituminous character, less inflammable than that of Scotland, but more so than that of the north of England. The principal beds are the Rover, the Gubberother, and Aughabehy collieries, in the latter of which the chief seam, and the only one deemed sufficiently rich to defray the expense of working, is from one foot to two and a half feet thick, but subject to interruptions, or what the workmen call *faults*, occasioned by the strata of one part of a hill having slipped down to a depth of from twenty to fifty yards, and settled on a lower level. The principal beds of iron ore are also on the south side of the Arigna river, whence the workings derived their name. They exhibit decisive indications of having been in operation at an early period; but, most probably in consequence of the exhaustion of timber for fuel, they were latterly inoperative until 1788, when the pit-coal found in the neighbourhood led to a new speculation in them by three brothers of the name of O'Reilly, who, either for want of sufficient

Roscom-
mon.

Roscom-
mon. capital, or in consequence of the real unproductiveness of the concern, mortgaged the works and premises, which were then sold to Mr Peter Latouche, the banker, who, after a total expenditure of L.80,000, abandoned the speculation in 1808 as profitless and hopeless. The workings of the collieries were resumed in 1825 by three joint-stock companies—the Arigna Coal and Iron Company, the Irish Mining Company, and the Hibernian Mining Company; but only one of them, the Arigna company persevered in the experiment, and worked the mines of both coal and iron. The affairs of the company became the subject of parliamentary inquiry, and in the session 1826–27 a voluminous report was issued, containing an exposition of one of the most extraordinary instances of jobbing and fraud which even that period could produce. The iron-works have long been suspended, but the coal-pits are still worked occasionally. Potters' clay is found in several places, and is manufactured into the coarser kinds of wares; and along the shores of Lough Ree, and also more inland at Killymount, are several deposits of very pure clay, which has given rise to a local manufacture of tobacco-pipes, for which the material is well adapted. Fire-bricks were made at Augna, of fire-clay, which forms some of the mineral strata there.

The soil varies nearly according to the nature of its substratum, that on the limestone being much the most productive; except in the hilly district between the Shannon and the Suck, in which the stone rises so near the surface that the superincumbent vegetable mould is scarcely of depth sufficient to admit the use of the plough. The borders of the rivers which flow through the level parts, and are therefore liable to overflow their banks during winter, become, on the return of dry weather, pastures and meadows of the richest quality. Bogs of every size, from an extent of a thousand acres to patches merely adequate for the domestic demands of the immediate neighbourhood in which they lie, are to be found in many parts. The most remarkable and extensive of these are in the neighbourhood of Athlone and Lanesborough. The mountains are mostly covered with bog and marsh, interspersed with dry patches on which heath grows most luxuriantly. In the southern part, large tracts of a very light sandy soil, lying on the low hill between the Suck and the Shannon, afford excellent pasturage for sheep. The borders of Lough Aluyn are in some parts formed of sand, apparently carried from the lake by the wind. Large deposits of gravel and different kinds of loam are often found between the surface-soil and the rock which forms the substratum.

The population, according to calculations made at different periods, was as follows:—

Year.	Authority.	Population.
1760.....	De Burgo.....	41,172
1792.....	Beaufort	86,000
1812.....	Parliamentary Return	158,111
1821.....	Ditto	208,729
1831.....	Ditto	249,613
1841.....	Ditto	253,591
1851.....	Ditto	173,417

The number of inhabitants to the square mile in 1841 was 267; in 1851 only 183, being a diminution in density of 84 persons in each square mile. In 1851 about 45,000 of the inhabitants could speak the Irish language, and 1300 of that number could speak Irish only. Fully nine-tenths of the population are supposed to be Roman Catholics.

This population was represented in the Irish Parliament by eight members—two for the county at large, and two for each of the boroughs of Boyle, Roscommon, and Tulsk. The number was reduced to two at the Union, all the boroughs being deprived of the right of election. The number of registered electors for the county is about 2500.

The state of education, according to the parliamentary returns made in 1821 and 1824–26, was as follows:—

Year.	Boys.	Girls.	Sex not ascertained.	Total.
1821... ..	6981	3306	...	10,287
1824-26	8937	4998	711	14,646

Roscom-
mon.

Of the numbers stated in the latter of these returns, 1041 were Episcopalian Protestants, and 13,262 Roman Catholics; the religious persuasion of the remaining 343 was not specified. The total number of schools in the county was 309; of which 17, containing 545 pupils, were maintained by grants of public money; 38, containing 1954 pupils, by the voluntary contributions of societies or individuals; and the remaining 254 schools, which afforded the means of instruction to 12,147 pupils, were maintained wholly by the pupils' fees. The number of schools, and of pupils attending them during the week ended 12th April 1851, was ascertained by the Census Commissioners to be as follows:—

Schools.	No. of Schools.	No of Children.		
		Males.	Females	Total
National	70	2302	2006	4,308
Church Education ..	31	374	760	1,134
Diocesan	1	13		13
Endowed	2	55	19	74
Boarding	1	10	21	31
Private	116	2098	1310	3,408
Parochial	4	124	110	234
Free	5	63	216	279
Industrial .. .	6	12	233	245
Mission	6	62	141	203
Military.....	1	7	9	16
Workhouse	9	975	1175	2,150
Gaol	1	36	..	36
Total	253	6131	6000	12,131

The habits and occupations of the population are so thoroughly rural that there are but three towns with a population exceeding 2000 souls. There are several fine mansions and demesnes in the hands of resident noblemen and gentlemen, and numerous villas and country-seats belonging to independent landed proprietors; but the appearance of the dwellings and homesteads of the small farmers and cottiers in many cases are far from showing those indications of internal comfort that might be expected in a district so highly favoured by nature. Agriculture is carried on with much spirit amongst the higher classes, by whom the latest improvements in tillage and the best constructed vehicles and implements have been introduced; but the greater portion of the county might be much improved by the judicious application of capital and labour to the cultivation of the land. The extent of land under each description of crop in 1855 and 1858 was—

	1855. Acres.	1858. Acres.
Wheat	4,159	4,832
Oats.....	59,257	56,909
Barley, bere, rye, beans, and pease ..	488	685
Potatoes ..	36,793	42,468
Turnips ..	4,735	4,697
Other green crops	1,732	2,393
Flax.....	386	265
Meadow and clover	30,214	36,893
Total.....	137,764	149,142

In the mountainous districts the spade is frequently used instead of the plough. In these, also, the neighbouring landholders generally club their labour together, particularly in planting and raising potatoes, all uniting to complete the work of one farm, and then proceeding successively in a body to execute that of the other partners in the amicable joint-stock concern. The pastures are amongst the best in Ireland; and as their proprietors are almost fastidiously particular in the selection of live stock of every

Roscom-
mon.

description, the best-fed beasts are to be met with here. This is peculiarly the case with respect to bullocks; the sheep also are of first-rate quality, both as to fleece and flavour of carcase. In prime grazing land an acre feeds a bullock and a sheep. Notwithstanding the superior capabilities of the soil for pasturage, there are not many large dairies. The annual fair of Ballinasloe, in October, is the principal mart at which cattle and sheep are disposed of. The quantity of live stock in the county in 1857 and 1858 was—

	1857.	1858.
Horses	10,939	10,754
Cattle	93,973	96,620
Sheep	145,969	152,466
Pigs	32,826	32,395

Fences in general are made of stone walls, raised to a considerable height, as they are considered to afford better shelter for cattle than those of timber. That the county was once well wooded appears not only from the evidence of history, but from the fact, that, wherever the impediments to its growth are removed, the soil spontaneously throws up shoots of those species of forest-trees with which the whole face of the country was once covered. The excessive clearing of the woods, without precautionary measures to secure a new growth, has left the surface very bare; but this defect, equally unsightly to the eye of taste and injurious to the progress of improvement, is annually diminishing, through the exertions of the landed gentry, many of whose mansions are surrounded with noble plantations. Manufactures, with the exception of those already noticed, and of coarse woollens and linens for domestic consumption, do not exist. The articles of export are confined to agricultural produce and live stock, for which the Shannon affords great facilities. The navigation of this fine river, which, as has already been said, skirts the county along the whole of its eastern verge, was formerly so much obstructed by several rapids as to render it useless as a channel of enlarged inland traffic. These impediments have been obviated by means of short canals along the side of the river in those parts where the rapids occur. The connection by water with the eastern counties to Dublin is maintained by the Royal and Grand canals, which communicate with the Shannon at Tarmonbarry and Shannon harbour. As all the great lines of land conveyance to Connaught from Leinster and Ulster (including the Midland Great Western Railway, from Dublin to Galway) pass through the county, the roads are numerous, and generally well kept up.

The monastic antiquities are very numerous. The ruins of the abbey of Boyle, founded in 1148, still exhibit a large part of its highly-ornamented church, with its tower rising from the middle of the building, and resting on four columns of colossal dimensions, enriched with a variety of sculptures; and the Dominican friary at Roscommon contains a monument of an ancient member of the O'Connor family, exhibiting an effigy of an armed warrior in a lying posture, with four other armed figures on the base. Derham Abbey, in the neighbourhood of Roscommon, is little more than a heap of stones. The others of which some relics still exist, are Trinity Abbey, on an island in Lough Kea, Tulsk, Clonshanvill, and Clontuskert, in which there are several monuments and inscriptions relating to the O'Kellys and other ancient families. In the parish of Oran, a few miles from Roscommon, are the remains of an ancient pillar-tower about 10 feet high; and in every part there are raths so numerous that nearly five hundred are still visible. The county contained a great number of small fortresses, evidently built when it was one of the marches or border districts, to repress the incursions of the Connaught Irish, besides which there were a few of great extent and strength, as is testified by that of Roscommon,

Roscom-
mon.

forming a quadrangle of 220 by 180 feet, with towers at the angles and at the gateway, and containing the remains of a large building, supposed to be the residence of the governor. The most remarkable of the other castles are those of Athlone, Ballinasloe, Ballynafad, and Lough Glynn.

Roscommon, the county town, is built on the southern slope of a gently-rising hill, near the centre of the county. It consists but of one main street, with several minor avenues branching out into five main roads, in various directions. It was incorporated at a very early period, and was considered to be one of the chief places in these parts. Writs for the better defence of the town and castle are frequent among the earlier records. It returned two members to the Irish Parliament till the Union. Here are the buildings connected with the local administration of justice; the county court-house, the prison-house, the county infirmary, and fever hospital. The modern ecclesiastical buildings are not remarkable for architectural elegance. The parish church is a neat structure. The town is a place of very limited trade, except in that of grain, large quantities of which are sent to Lanesborough, to be exported thence by means of the Royal Canal or the Shannon. The population in 1851 was 3364. No other town wholly within the county has a population exceeding 2000, except Boyle, a neat and commercial town, with a population of 2767 souls. Part of the town of Athlone, on the Shannon, in which are the fortified magazines intended for the defence of the pass of the Shannon, is on the Roscommon side of the river. A small portion of the town of Ballinasloe, celebrated for its great annual fair for sheep and horned cattle, is also in this county. (H. S.—R.)

ROSCOMMON, WENTWORTH DILLON, *Earl of*, a celebrated poet of the seventeenth century, was the son of James Dillon, Earl of Roscommon, and was born in Ireland about 1634, under the administration of the Earl of Strafford, who was his uncle, and from whom he received the name of *Wentworth*. He passed his infancy in Ireland; after which the Earl of Strafford sent for him to England, and placed him at his own seat in Yorkshire, under the tuition of Dr Hall, who instructed him in Latin, without teaching him the common rules of grammar, which he could never retain in his memory, though he learned to write in that language with classical elegance and propriety. On the Earl of Strafford's being impeached, he went to complete his education at Caen in Normandy; and after some years he travelled to Rome, where he became well skilled in medals and in the Italian language. He returned to England soon after the Restoration, and was made captain of the band of pensioners; but a dispute with the lord privy-seal about a part of his estate obliged him to resign his post and revisit his native country, where the Duke of Ormond appointed him captain of the guards. He was unhappily very fond of gaming; and as he was returning to his lodgings from a gaming-table in Dublin, he was attacked in the dark by three ruffians who were employed to assassinate him. The earl defended himself with such resolution that he had despatched one of the aggressors, when a gentleman came up and disarmed another, on which the third took to flight. This generous assistant was rewarded for his bravery by Roscommon resigning to him his post of captain of the guards. His lordship at length returned to London, when he was made master of the horse to the Duchess of York, and married the Lady Frances, the eldest daughter of Richard, Earl of Burlington, and the widow of Colonel Courtney. Here he distinguished himself by his writings; and, in imitation of those learned and polite assemblies with which he had been acquainted abroad, he began to form a society for refining and fixing the standard of the English language, in which his great friend Dryden was a principal assistant. In 1683 he was seized with the

Roscrea
||
Rosellini.

gout, which, by improper medical treatment, led to his death, which happened in the month of January 1684. He was buried with great pomp in Westminster Abbey.

His poems, which are not numerous, are in the body of English poetry collected by Dr Johnson. His *Essay on Translated Verse* (1684), and his translation of Horace's *Art of Poetry* (1680), have been much commended. Upon the latter, Waller addressed a poem to his lordship when he was seventy-five years of age. "In the writings of this nobleman we view," says Fenton, "the image of a mind naturally serious and solid; richly furnished and adorned with all the ornaments of art and science; and these ornaments unaffectedly disposed in the most regular and elegant order. His imagination might probably have been more fruitful and sprightly, if his judgment had been less severe; but that severity (delivered in a masculine, clear, succinct style) contributed to make him so eminent in the didactical manner, that no man with justice can affirm he was equalled by any of our nation, without confessing at the same time that he is inferior to none. In some other kinds of writing his genius seems to have wanted fire to attain the point of perfection; but who can attain it? He was a man of an amiable disposition, as well as a good poet; as Pope, in his *Essay on Criticism*, has testified in the following lines:—

"Roscommon, not more learned than good,
With manners generous as his noble blood;
To him the wit of Greece and Rome was known,
And every author's merit but his own."

Roscommon enjoys the distinction of being the only correct writer in verse before the time of Addison; and if there are not so many or so great beauties in his composition as in those of some contemporaries, there are at least fewer faults. "Of Roscommon's works," says Johnson (*Lives of the Poets*), "the judgment of the public seems to be right. He is elegant, but not great; he never labours after exquisite beauties, and he seldom falls into gross faults. His versification is smooth, but rarely vigorous; and his rhymes are remarkably exact. He improved taste if he did not enlarge knowledge, and may be numbered among the benefactors to English literature."

ROSCREA, a market-town of Ireland, in the county of Tipperary, on an affluent of the Brosna, in a fertile country at the foot of the Slievebloom Mountains, 65 miles W.S.W. of Dublin. It is an old place, irregularly and not very well built; but has some broad streets and good houses. The most conspicuous object here is the ancient round tower, 80 feet high, which is one of the largest in the country; and, unlike most of the rest, built entirely of square stones. The parish church has a curious Gothic front at its west end, and the belfry of the Roman Catholic church consists of the steeple of an old Franciscan priory. The ancient castle of the Ormonde family is now used as a military storehouse. The other chief buildings in Roscrea are the court-house, market-house, jail, national school, hospitals, and workhouse. Coarse woollen cloth is manufactured here to some extent, and there is a considerable trade in grain. The town is of great antiquity, for it owes its origin to a monastery which was founded in 620. Pop. (1851) 3496.

ROSE. See BOTANY, § *Rosaceæ*.

ROSEAU, or CHARLOTTE TOWN, the capital of the island of Dominica, West Indies, on a tongue of land on the S.W. coast; N. Lat. 15. 19., Long. 61. 28. It is regularly laid out and well built, and has a fort and a safe roadstead. Pop. 5000.

ROSELLINI, IPPOLITO, *Cavaliere*, a celebrated scholar, was born at Pisa in 1800. His taste for archæological studies was awakened under the tuition of a Servitan monk. He pursued them during his university career in his native city and in Bologna. The appointment in 1824 to the

Rosen
||
Rosetta.

chair of oriental languages at Pisa increased his enthusiasm for his favourite subject. Taking up the particular branch of Egyptian hieroglyphics, he became a devoted disciple of Champollion. He accompanied that famous French orientalist in his exploration of Italy, and in his subsequent researches at Paris. He then, in 1828, went with him on a tour of discovery through Egypt and Nubia. He was also about to assist him in publishing the results of their common journey of investigation when Champollion died in 1832. Rosellini accordingly was left to conduct the great undertaking alone. The first volume of the work appeared in 1832, under the title of *I Monumenti dell'Egitto e della Nubia*. He had just published the eighth volume when he died in 1843. The two remaining volumes were conducted through the press by his friends in 1844.

ROSEN, FREDERICK AUGUSTUS, a profound orientalist, was born at Hanover in 1805. His taste for the eastern languages began to be cultivated at the universities of Leipsic and Berlin. The Sanscrit, in particular, captivated his attention. He first studied the elements of that tongue under his father. He then acquired further instruction from Professor Bopp. At length, in 1827, he arranged and developed his knowledge in a work entitled *Radices Sanscritæ*. So great progress, in fact, did he make, that at the age of twenty-two he was appointed professor of the oriental languages in the university of London. The young scholar now entered upon a career of great eminence. His wonderful erudition in languages soon won the general admiration. At the same time, the gentleness and honesty of his disposition disarmed all envious detraction. Honours from several quarters continued to be conferred upon him. University College translated him to their chair of Sanscrit. The Royal Asiatic Society made him their foreign secretary. The Oriental Translation Committee appointed him to a similar office. The learned men of the Continent, too, cultivated his acquaintance; and there was scarcely an oriental work undertaken in Europe for which his aid was not sought and given. Encouraged by this patronage, Dr Rosen devoted the latter part of his life to a thorough investigation of the character of the Indian language and literature. For this purpose, he commenced to elucidate the *Vedas*. His *Rig Veda Specimen*, published in 1830, was the first result of his labours. Another collection of the same kind, containing the Sanscrit text, a Latin translation, and explanatory notes, was in the press when he was prematurely cut off at the age of thirty-two. It was published under the title of *Rigveda-Sanhita Liber Primus*, London, 1844.

ROSENAU (Hung. *Rozsno banya*), a town of Hungary, in the county and 15 miles N.E. of Gömör, on the Sajó. It contains a large cathedral, episcopal palace, churches, convents, episcopal seminary, Roman Catholic and Protestant grammar schools. The scenery in the vicinity is very fine; and there are near the town mines of iron, copper, lead, and antimony. Rosenau has potteries, bleach-fields, tanneries, breweries, and manufactories of wax-candles. Some trade is carried on in honey, wax, and pease. Pop. 7000.

ROSENAU (Magyar *Rosnyo*), another town of the Austrian empire, Transylvania, in the circle and 7 miles S.W. of Kronstadt. It has a strong castle, where is a well 456 feet deep, hewn out of the rock. Flax, tobacco, and honey are produced here. Pop. 4000.

ROSES, ATTAR OF. See OILS.

ROSETTA (Arab. *Rasheed*), a seaport of Egypt, on the left bank of the most westerly mouth of the Nile, hence called the Rosetta Mouth, 40 miles N.E. of Alexandria. Along the bank of the river stretches a broad open space, forming a public walk; beyond this is the town, consisting of parallel streets running from N. to S., crossed by other shorter ones. As in most eastern towns, the streets are

Rosheim.
||
Ross.

extremely narrow, sometimes not more than two yards across, while the upper storeys of the houses frequently meet. The buildings are for the most part of dull, red brick, two or three storeys high. The groves of palms, bananas, and orange trees about Rosetta, contrasting with the surrounding expanse of barren and dreary sand, give a beautiful appearance to the town; and the salubrity of the climate attracts many visitors. The public buildings comprise several mosques, a Greek and a Roman Catholic church, *khans*, and bazaars. The town is inclosed by loop-holed walls. There are still some manufactures at Rosetta, especially weaving of cotton and linen fabrics; and the trade which was formerly carried on with Europe and the Levant, though now for the most part transferred to Alexandria, has not altogether deserted the place. It was here that the celebrated Rosetta stone was found, now in the British Museum, containing the trilingual inscription that furnished the key to the Egyptian hieroglyphics. Pop. probably about 15,000. (See EGYPT.)

ROSHEIM, a fortified town of France, in the department of Bas-Rhin, among the Vosges Mountains, 14 miles S.W. of Strasburg. It contains two handsome churches, a town-hall, and an hospital. Manufactures of cotton cloth are carried on. In the vicinity are mineral springs. Pop. 3971.

ROSICRUCIANS. See MYSTICISM.

ROSLIN, a village of Scotland, in the county and 7 miles S. of Edinburgh, on the Esk, among scenery which for beauty is inferior to few places in the country. It is chiefly remarkable for the ancient chapel and castle which stand here. The former is an exceedingly beautiful specimen of florid Gothic architecture; it was founded in 1446, and the plan was to have been in the form of a cross; but only the choir and east wall of the transept were completed when the building was stopped in 1484. The carving is very elaborate, especially on what is called the 'Prentice's Pillar. Of the castle which stood on the edge of a cliff overhanging the river, the triple row of vaults, the massive wall, and many scattered fragments, still remain. At Roslin is a paper manufactory, bleach-field, and gunpowder manufactory, the largest in Scotland. In this neighbourhood the Scots gained three victories over the English on the same day in 1302.

ROSS, a market-town of England, in the county of Hereford, on the left bank of the Wye, 14 miles S.S.E. of Hereford, and 120 W.S.W. of London. It is a pleasant-looking place, in a fine situation overlooking the river; but the streets are steep and narrow, though generally well paved. Near the centre stands an old and interesting town-hall; the parish church also is an ancient building in the perpendicular style, conspicuous for its lofty spire, which has repeatedly been struck by lightning. In the church are several ancient monuments, including one of Kyrle, the "man of Ross," eulogised by Pope. The other places of worship belong to Wesleyans, Baptists, Independents, and Quakers. The town contains national and other schools, a mechanics' institution, dispensary, savings-bank, &c. Once there was here a considerable trade in iron, but cider is now the chief article of commerce. Markets are held weekly, and fairs six times a year. Pop. (1851) 2674.

ROSS, or *Roscarbery*, a market-town of Ireland, in the county of Cork, on a rocky hill at the head of Ross Bay, 39 miles S.W. of Cork, and 197 S.W. of Dublin. It has an old cathedral, which has been several times altered, and is now surmounted by a modern spire. A Roman Catholic church, court-house, market-house, jail, and dispensary are also in the town. A weekly market and two annual fairs are held here. Pop. (1851) 1044.

Ross, *New*, a parliamentary and municipal borough of Ireland, in the county of Wexford, on the left bank of the Barrow, here crossed by a wooden bridge leading to the

suburb Rosbercon, 13 miles N.N.E. of Waterford. It consists chiefly of a long street extending along the summit of the high river-bank, with shorter ones rising steeply to it on either side; but there is a more modern portion built along the water's edge. The town was formerly inclosed by walls, but these were demolished by Cromwell in 1649. The parish church is a neat building on the site of an ancient abbey, of which there are still some remains. Rosbercon has also a parish church, this, too, partially consisting of an older building; and there are places of worship for Roman Catholics, Methodists, Presbyterians, Independents, and Quakers. Among the other buildings of the town are a market-house, court-house, bridewell, cavalry barracks, several hospitals, workhouse, and dispensary; and in addition to these, New Ross has a grammar school, news-room, and circulating library. The principal manufactures of the town are tanning and brewing; and the trade is very considerable,—grain, flour, wool, butter, &c., being exported. There are extensive quays, where vessels of 200 tons can lie at all tides, and those as large as 800 at spring-tides. The river is navigable for barges as far up as Athy, and from thence there is communication by canal with Dublin. The number of ships registered at the port 31st December 1857 was 14 sailing-vessels, tonnage 4219. In the year ending on that day there entered the harbour 297 sailing-vessels, tonnage 25,151; and there cleared 58, tonnage 5659; while the number of steam-vessels that entered and cleared was 324 each, tonnage 27,216. A great number of the inhabitants are employed in salmon-fishery on the river, both above and below the town. Markets are held here twice a week, and fairs monthly. During the rebellion in 1798 New Ross was attacked by the insurgents, but after ten hours' fighting, they were repulsed with great loss. The borough formerly sent two members to the Irish Parliament, and now one to that of the United Kingdom. Pop. (1851) 7941.

ROSS, SIR JOHN, the famous Arctic navigator, was a son of a minister of the Church of Scotland, and was born at Balsarroch in Wigtonshire in 1777. His nature was early inured to toil and hardship. He was no more than nine when he entered the navy. His services as a midshipman were immediately employed in the Mediterranean. So soon afterwards as 1806, he was engaged as a lieutenant in the French war, and received no less than thirteen wounds. It was in 1818 that Ross undertook to settle the disputed question about the North-West Passage. Setting sail in the *Isabella*, and attended by Lieutenant Parry in command of the *Alexander*, he left the Thames on the 25th of April. On reaching the American coast, his ships pressed on through Davis Straits and Baffin's Bay, and turned their prows into Lancaster Sound. He had not proceeded much farther before he imagined that he espied a line of high land sweeping across the breadth of the bay, and closing up the passage. Fancying that the object of his enterprise was accomplished, he immediately tacked about, and in spite of the remonstrance of Parry, sailed away homewards. His ships arrived in the Thames on the 14th December 1818, and in the following month he was rewarded with the rank of post-captain. The next expedition of Captain Ross to the same regions was undertaken in May 1829. His vessels were the steamer *Victory*, equipped at the expense of Felix Booth, sheriff of London, and the *Krusenstern*, furnished by the government. His design was to penetrate if possible through Prince Regent Inlet, recently discovered by Parry, into Barrow's Straits. Accordingly, on the 12th of August he entered into the former of these seas. He had not sailed far before he got blocked up in the ice, which detained him for many months. Year after year his course was intercepted. Towards the end of the fourth year it was found necessary to abandon the vessel and to

Ross.

Cromarty.

Ross and
Cromarty.

press northward with the boats. At length, on the 26th of August 1833, he and his crew were picked up in Lancaster Sound by his old ship the *Isabella*. The remainder of Ross's life was spent in the enjoyment of knighthood and other honours which his exertions had merited. His only other expedition was an unavailing attempt, which he made at his own expense in 1850, to discover and save Sir John Franklin. He died on the 30th August 1856. Ross published accounts of his first two voyages. He is also the author of *Letters to Young Sea-Officers*; *Memoirs of Admiral Lord de Saumarez*; *A Treatise on Navigation by Steam*; and other works.

ROSS AND CROMARTY, two shires of Scotland, so curiously mixed up in geographical position, and so closely united politically, as to render their description under one head a matter not merely of convenience, but even of necessity. They are bounded on the N. by Sutherlandshire, E. by the German Ocean, S. by Inverness-shire, and W. by the Atlantic; and lie between N. Lat. 57. 8. and 58. 6., W. Long. 3. 45. and 5. 50. Besides this portion of the mainland, the northern portion of the island of Lewis in the Hebrides is included in Ross-shire. The whole area is 3151 square miles, or 2,016,375 statute acres: length, from E. to W., 67 miles; average breadth, 58. Ross-shire, comprising the districts of Easter and Wester Ross, Ardmeanach, or the Black Isle, and the island of Lewis, is the third in size among the counties in Scotland. The county of Cromarty, on the other hand, is comparatively small. It is divided into eleven portions, which are whimsically inserted into various parts of the larger county of Ross, like fragments of a more ancient rock in some newer geological formation. One of these parts is the original county of Cromarty, anciently called *Crumbachtu*,—that is, “Crooked Bay,” from the windings of its shores, consisting of that portion which lies in the peninsula to the S. of the Cromarty Firth, and which surrounds the county town. This part rises like a huge lump to a height of 470 feet above the level of the sea, which washes the base of its cliffs, and it is this space—containing a parish and a half—which still preserves for the county a separate lord-lieutenancy and commission of supply. As a county, it was originally very inconsiderable both in extent and in value; but by the straggling additions which were made to it towards the end of the seventeenth century, it was increased to fifteen times its former extent. Of these additions, one is a small district surrounding Tarbat House, on the northern shore of Cromarty Bay; and a second runs from the S. side of the Tan Firth to Moray Firth, cutting off that portion of the county of Ross which terminates in Tarbat Ness, the extremity of which also belongs to Cromarty. Two more fragments are found lying on the south of the River Carron, which has its embouchure near Bonar Bridge; a sixth is that which runs northward from the burgh of Dingwall, taking in Castle Leod and part of Ben Wyvis; the seventh lies to the N. of Loch Fannich, at some distance to the N.W. of which a triangular morsel is found to the N. of Loch Nid; the ninth is that which stretches along the southern shore of Little Loch Broom; and the tenth is the large district of Coygach, lying between the northern shore of Loch Broom and Sutherlandshire; to which may be added the Summer Islands, at the mouth of Loch Broom, which are about 60 miles distant from the town of Cromarty. This strange arrangement of territory was produced by the influence of that great and powerful proprietor, George, Viscount Tarbat, afterwards Earl of Cromarty, who, wishing to have all his various lands included in one shire, got them annexed to his own county in 1685 and 1698. But these were not all, nor the most extraordinary, annexations which he accomplished. For, as a part of the county of Cromarty, we are compelled to notice Royston, or Caroline Park, locally situated within

VOL. XIX.

the county of Edinburgh, and but a couple of miles from the Scottish capital. But such arrangements were by no means singular. The district of Ferintosh, belonging locally to Ross-shire, is in fact a part of Nairnshire; and from similar causes many of the houses in the Canon-gate of Edinburgh belong to different counties in Scotland, from their having been the town residences of Scottish noblemen whose estates lay in those different shires. By the addition of all those portions which we have enumerated, the extent of Cromarty is calculated to be equal to an area of 345 square miles, or about 220,800 imperial acres.

The united county extends, as has already been stated, across the island from the German Ocean to the Atlantic. On the eastern coast, Cromarty Firth shoots inland from that of Moray through the narrow strait produced by those grand and picturesque headlands called the Sutors of Cromarty, and expands into a still and land-locked basin, capable of holding the whole navy of Great Britain. The headlands themselves are so lofty and precipitous that it is not uncommon during gales of wind from the north-eastward, to see waves breaking upon them to the height of 100 feet, whilst all within is smooth. The firth is rather more than 5 miles broad at the widest part, and its length is about 18. The depth averages from 9 to 12 fathoms, but in the entrance it in some places exceeds 30; a depth which nearly doubles that of Moray Firth, into which it opens. The western coast is indented by many bays and sea-lochs, which afford numerous havens of shelter from the storms of the Atlantic. From S. to N., these are Loch Alsh, with its two branches Loch Duich and Loch Ling; Loch Carron, with its branch Loch Keeshorn; Loch Torridon, Garloch, Loch Ewe, Loch Greinord, Little Loch Broom, Loch Broom, and Loch Enard. All these exhibit magnificent scenery. That of Loch Torridon, for example, is of the grandest and wildest character; as is likewise that of Loch Duich, rendered peculiarly interesting by the remains of the castle of Eilan Donan, the ancient stronghold of the Mackenzies, the lords of Kintail. The outer headlands of the western coast of Ross-shire, N. of Loch Carron, are composed of sandstone, exhibiting the usual smooth and regular outline characteristic of that formation; and hence the promontories are tame, and of an unvaried reddish aspect, and the shores of the bays are for the most part covered over with brown heath. It is therefore more in the inner recesses of these inlets, and perhaps somewhat inland, that the most romantic scenery is to be found.

The general surface of Ross and Cromarty is wild and mountainous, the mountain chains and groups being interspersed with valleys, glens, lakes, and rivers, exhibiting nature in every variety of form and character.

Amongst the numerous fresh-water lakes and rivers to be found in Ross and Cromarty we may particularize the following:—The River Oikel, which divides Ross-shire from Sutherland, rises near the eastern side of the island, and after a course of 20 miles, finds its way into the upper end of the Tain or Dornoch Firth, a few miles above the fine iron-arched bridge of Bonar. Then, as we move southwards, we have the River Carron and the Water of Fearn, discharging themselves into the same firth. Cromarty Firth receives the large and important stream of the Conon, and its affluent the Raney or Blackwater. On the W. coast we have the rivers Sheil and Ling, the one tributary to Loch Duich, and the other to Loch Ling; the River Carron discharging into Loch Carron the waters of Lochs Doule and Scaven. The River Ewe, which is only 1 mile in length, discharges into Loch Ewe the waters of the grand Loch Maree, which is by far the largest and finest lake in Ross-shire. It is 12 miles long and about $2\frac{1}{2}$ broad, and the greater part of it is full 60 fathoms deep; so that it has never been known to freeze even in the most intense frosts. It contains no less than twenty-four islands, its mountains

3 H

Ross and
Cromarty.

are magnificent, and it is now quite accessible. The only other fresh-water lakes of any size or importance are Loch Fannich, Loch Luichart, and Loch Glas, all near the centre of the county. The whole area occupied by water is estimated at 90 square miles.

The scenery on the River Conon and some of its tributaries is beautiful and interesting. The falls of Rogie are by many considered as inferior only to those of Foyers and Moness. We may indeed affirm that most of the valleys or river-courses in the united counties are more or less worth visiting, for the wild, the romantic, or the retired pastoral scenes which they contain. The waterfall of Glomach, in the parish of Kintail, is one of the highest and finest in the kingdom. The road from Keeshorn over the mountain to Applecross is like a Swiss pass, and is probably the only drive from which ptarmigan might be shot from a vehicle.

The mountain groups of Ross and Cromarty are very lofty. They rise gradually from the east coast, and more suddenly and boldly from the western sea, to which the summit-level of the country is more generally approximated. Granite and mica slate occupy the centre of the county; while for 10 or 15 miles inland from the coasts the substratum is generally old red sandstone. There are also argillaceous formations abounding in animal remains, with plates resembling those of the tortoise, pieces of rough skin like that of the shark, the scales and bones of fish; and in a ridge of bituminous shale near the Cromarty rocks we find ammonites, belemnites, scallops (plain and striated), pieces of wood, and a thick fleshy-looking leaf resembling that of the aloe. The mineralogical catalogue is large. Limestone and primitive limestone of the character of marble are very commonly to be met with. Ironstone is disseminated in great abundance. On the farm of Scorraig, on the Dundonnell estate, there is a prodigious quantity of bog-iron ore, which gives a strong and harsh chalybeate taste to all the springs in the neighbourhood. There are various mineral springs in the united shires of Ross and Cromarty, but those which have attained the greatest celebrity are the two wells of Strathpeffer, which have now for many years attracted numerous visitors to their neighbourhood in search of health and recreation. Both of these springs have the smell of sulphuretted hydrogen gas, but the upper spring is stronger than the lower.

Many of the mountains of Ross and Cromarty are among the highest in Britain. Ben Wyvis or Ben Uaish,—that is, the Mountain of Storm,—is one of the most remarkable mountains, not only in Ross and Cromarty, but in Scotland. Its height is 3422 feet; but it is most wonderful for its immense bulk, by which it stands prominently distinguished from the other hills around it, so as to be peculiarly striking from great distances. Ben Dearg, on Loch Broom, is 3551 feet in height. The chief other heights are Kea Cloch, near Loch Broom, 3600 feet; Ben Lair, near Loch Maree, 3000 feet; and Ben Attow, on the border of Inverness-shire, 4000.

The soil of Ross-shire varies in its character in different parts of the county. In the E. there are two peninsulas,—the Black Isle, between the Firths of Beauly and Cromarty; and Easter Ross between those of Cromarty and Dornoch,—which, along with some of the adjacent country, contain arable land of much fertility; but the great mass of the country, including the central and western portions, is rugged, mountainous, and unfit for the plough. The mountains, and particularly those towards the W., are covered with excellent pasture for sheep. Some of the sheep-farms are extensive, and possessed by farmers of capital, who have introduced the Cheviot breed of sheep, or a cross of that breed. The valleys and glens are also depastured for the most part by sheep. Although agriculture is found in patches in the valleys and on the shores of the W. coast, the great agricultural districts of Ross and Cromarty are

Ross and
Cromarty.

those extending from Dingwall along the northern shore of Cromarty Firth, and so onwards in a north-eastern direction along the Moray Firth and that of Dornoch, and the district of the Black Isle. All the grains and other agricultural produce of Britain are raised in perfection; and the farming is as well carried on here as in any part of Scotland. The roads made in Ross-shire by the parliamentary commissioners and the proprietors are extensive and excellent, and they are kept in the highest state of repair. Many of the wildest and most unapproachable districts have thus been opened; and though there are still many left hermetically sealed against all but the adventurous horseman or the unwearied pedestrian, there has been much done very recently.

The total number of acres under crops in 1857 was 72,851; and of these, 9715 were occupied with wheat, 6435 with barley, 16,256 with oats, 212 with rye, 289 with bere, 437 with beans, 360 with pease, 911 with vetches, 12,228 with turnips, 4471 with potatoes, 550 fallow, and 20,869 with grass and hay. The number of horses in the same year was 4759; of cattle, 17,610; of sheep, 304,444; of swine, 1761; in all, 331,381 head of live stock.

The natural woods in Ross and Cromarty, though much diminished, are still numerous, and widely scattered through the glens and over the mountain-sides. The trees are chiefly firs, oaks, ash, birch, and alder. The whole face of the wilder country bears evidence of its having been once covered with extensive forests, fragments of which only now remain in certain places. The climate is exceedingly variable, differing much on the two sea-boards, and in general rainy, though there are often long periods of dry weather, and sometimes the same day appears as if it belonged in succession to all the seasons. The annual mean temperature is 46°. In the arable districts the climate has been sensibly improved of late years by drainage and other improvements in agriculture and planting.

From the great extent and immense variety of elevation and of surface of Ross and Cromarty, it naturally contains by much the greater part, if not nearly all, the plants to be found in the Flora Scotica; and in the same way, speaking generally, almost all the animals to be found in the zoology of Scotland have been discovered to belong to it. The larger wild quadrupeds are red and roe deer, hares, alpine hares, foxes, badgers, wild cats, &c. Grouse, ptarmigan, black game, and partridges abound; and in some places pheasants have been introduced, and have amazingly increased. The golden eagle and the osprey are both common, as well as all the other birds of prey. Water-fowls of all kinds abound on the coasts; and the Firth of Cromarty is especially remarkable for the number and variety of sea-fowl which may be obtained by the skilful sportsmen. In severe winters it frequently happens that many wild swans are shot there. All the lochs and streams abound with fish, and salmon are particularly abundant in all the rivers, especially in the Oikel and in the Ewe. Short as is the course of this last-mentioned stream, it so swarms with salmon that twenty fish are no uncommon number for an expert angler to take in one day. The trouts of Loch Luichart and many other lakes are far-famed. The pearl-mussel is found in the stream of the River Conon, and frequently affords pearls of remarkable beauty.

The number of proprietors in the county is 117, and the valuation of rent for 1858-9 is L.175,355.

The introduction of steam navigation has done much to improve Ross and Cromarty, not only by making them more easily accessible, but by the opening which it has created for the export of cattle and sheep to the southern markets. The change in this respect may be readily conceived when we consider the immense land-journey which the animals had to undergo before they could be brought to the Edinburgh market. They were driven off in a lean

Ross and
Cromarty

state, and were fed in the south country, before they could be sold for food. Now, a Ross-shire farmer frequently imports lean cattle from the south, and returns them so fed as to be in a condition for immediate slaughter. On the east coast, the principal shipping port for cattle, sheep, and all kinds of farm produce by steam-vessels is Invergordon, a very thriving village on the Ross-shire side of the Cromarty Firth, midway between Tain and Dingwall. It has an excellent harbour and new piers, from which it is intended to have a steam ferry to some point of junction with the railway on the Morayshire coast. The western coast is also connected with Glasgow by an admirable steam service. The effect of these facilities in raising the value of property in the northern counties may easily be imagined.

There are no important manufactures of any kind in the county, but a large proportion of the inhabitants are employed in fishing. The following table exhibits the number and tonnage of the boats, and the number of persons, employed in connection with the fishery in the several districts of the county in the year 1856:—

Districts.	Boats.		Crews.	Other persons employed.
	No	Tonnage.		
Loch Carron	826	3001	3022	2272
Loch Shildag.	310	1490	1088	527
Loch Broom	564	2763	2215	3511
Stornoway	568	5816	2357	4353
Cromarty	279	2167	817	2158
Total	2547	15,237	9499	12,821

In the same year the number of barrels of herring caught, cured, and exported in the several districts, was:—

	Caught, but not cured.	Cured.	Exported.
Loch Carron	8500	5517	1235
Loch Shildag.	1670	2476	.
Loch Broom	390	296	.
Stornoway	2046	28,709	15,451
Cromarty	550	10,203	9524
Total	13,156	47,201	26,200

The number of barrels of cod, ling, and hake caught, cured, and exported in the same year is exhibited in the following table:—

	Caught, but not cured.	Cured	Exported.
Loch Carron.	3500	5370	..
Loch Shildag.	1410	1363	.
Loch Broom	690	710	.
Stornoway	5322	17,970	800
Cromarty	1400	34	.
Total	12,323	25,447	800

In the above tables it must be observed that the column of persons employed comprehends the coopers, labourers, gutters, packers, and those engaged in cleaning and drying the fish. It is also to be noticed that the Loch Carron fishery district includes the Isle of Skye in Inverness-shire. Every kind of fish that frequents the northern seas may be taken on the coasts of Ross and Cromarty, particularly on those of the island of Lewis. The Broad Bay flounder of Stornoway is the finest in the world. The saithe is much more delicate than the whiting. The haddock is remarkably good on the east coast, and is a great branch of trade in its cured or smoked state. Turbot, lobsters, and even wilks, are now also exported to London.

The burghs of Cromarty, Dingwall, and Tain, along with Dornoch, Wick, and Kirkwall, return a member to Parliament. Fortrose and Rosemarkie, two small adjacent towns included in one burgh, return a member along with Inverness, Nairn, and Forres. Besides these burghs, the united county has several villages or small towns in it, such as

Rossano.

Invergordon, Alness, Evantown, Portmahomack, Conon, Shildaig, Dornie, Plocktown, Jeantown, and Ullapool.

Ross-shire is divided into 33 parishes, of which 29 are on the mainland and 4 in the island of Lewis. The whole number of places of worship, according to the census of 1851, was 75, with 44,644 sittings. Of the former, 27 belonged to the Established Church, 40 to the Free Church, 3 to the Episcopahans, 2 to the United Presbyterians, and one each to the Independents, Baptists, and Roman Catholics. At the same period the county contained 148 public and 19 private schools, the former attended by 9379 and the latter by 600 scholars; 70 Sunday-schools, with 5243 scholars, and one evening school with 22.

In Ross and Cromarty there are many ancient and curious remains. In the parish of Nigg, the site of the castle of Dunskeath, built by William the Lion in the year 1179, is still to be distinguished. At Shandwick is the *Clach-a-Charradh*, or the "Stone of the Burial-place," an obelisk covered on all sides with curious Runic sculptures. There is a similar though smaller stone in the church-yard of Nigg. It originally stood near the gate, but it was thrown down by the fall of a belfry in 1725, and it is now fixed to the eastern gable. These obelisks or crosses are supposed to be of Scandinavian origin. Craigchenichan, or the Rock of Lamentation, in the parish of Kincardine, marks the place where the Marquis of Montrose was defeated by Colonel Strachan, after which he swam across the Kyle, and lay concealed in Assint until apprehended and sent prisoner to Inverness. The abbey and castle of Lochslin, in the parish of Fearn, are remarkable. Of the former, the chancel nave and two side chapels still remain, though greatly dilapidated. The castle of Lochslin is supposed to be more than five centuries old. It stands on an eminence about 4 miles to the eastward of Tain, but it is now very much gone. The castle of Cadboll, of which little remains, is supposed to be yet more ancient than that of Lochslin. Balone castle, in the parish of Tarbat, is also a very fine ruin. Near Ob-Inag, in the parish of Glenshiel, is to be found a fine specimen of what has been called the Pictish Tower. At Dingwall are the remains of the ancient castle of the earls of Ross. The hill of Knockfarril, in the parish of Fodderty, is crowned with one of those curious and puzzling morsels of antiquity usually known by the name of vitrified forts. There are many ancient single stones, and circles of stones, and cairns, in different parts of Ross and Cromarty, and many interesting antiquities have been discovered at various places in the county.

The principal seats of noblemen and gentlemen in Ross-shire are Brahan Castle, belonging to Mrs Stewart Mackenzie of Seaforth; Belmaduthy House, to Sir Evan Mackenzie of Kilcoy; Flowerdale and Conon, to Sir Kenneth-Smith Mackenzie of Garloch; Coul, to Sir William Mackenzie; Rosehaugh, to Sir J. J. Randall Mackenzie of Scatwell; Foulis Castle, to Sir Charles Munro of Foulis; Balnagowan, to Sir Charles Ross; Redcastle, to Henry James Baillie, Esq.; Stornoway Castle, to Sir James Matheson of Lewis and Achany; Ardrross Castle, to Alexander Matheson, Esq.; Geanies House, to W. H. Murray, Esq.; besides Tarbat House, in Cromarty, belonging to the Marquis of Stafford. The two counties of Ross and Cromarty form one sheriffdom, and return one member to Parliament. Pop. (1801) 56,318; (1811) 60,853; (1821) 68,762; (1831) 74,820; (1841) 78,685; (1851) 82,707.

ROSSANO, a town of Naples, in the province of Calabria Citra, on a rocky eminence near the Gulf of Taranto, 29 miles N.E. of Cosenza. It is encircled by walls, and protected by a castle; and there are in the town a cathedral and numerous other churches, several convents, a diocesan seminary, and an hospital. In the vicinity are quarries of marble and alabaster. Capons and saffron are raised here, and there is a considerable trade in oil. Pop. 8500.

Rossi
||
Rostock.

ROSSI, PELLEGRINO, *Count*, an able diplomatist, was born at Carrara in 1787, and was educated for the bar. A shrewd and sagacious disposition fitted him to take a high place in the active business of life. Wherever he went his talents asserted his claim to influence and precedence. At Bologna he was one of the leaders of the patriotic party. At Geneva he became a professor of law, a member of the council, and a representative of the canton in the Diet. Nor did his ability fail to command preferment after he had settled in Paris in 1833. In no long time he was naturalized, and was made a peer of France. It was, however, at Rome, in 1848 that Count Rossi played his most important part. All his diplomacy was then employed to bring his country safe out of the complicated dangers of a revolution. As a member of the Roman cabinet, he strenuously endeavoured to effect reform in a constitutional way. So prominent, in fact, was his zeal in that line of policy, that he became the object of the deadly hatred of the republican party; and on the 15th November 1848 he fell by the dagger of an assassin.

ROSSIENY, a town of European Russia, capital of a circle in the government of Kovno, stands on the Kubisza, 100 miles W.N.W. of Vilna. It has two churches, a Piarist college, two schools, and two benevolent institutions. It was formerly the capital of the principality of Samogitia, which up to 1408 belonged to the Teutonic order, but was then joined to Lithuania. Pop. 6300.

ROSSWEIN, a town of the kingdom of Saxony, on the right bank of the Freiberg-Mulde, in the circle and 41 miles E.S.E. of Leipzig. It contains factories for weaving and wool-spinning, and has an important market for corn. Pop. 6067.

ROSTOCK, the largest and most important town in the grand duchy of Mecklenburg-Schwerin, on the left bank of the Warnow, about 9 miles above its mouth in the Baltic, 131 miles W. by N. of Hamburg; N. Lat. 54. 5., E. Long. 12. 20. It stands on a hill, and is surrounded by ancient walls and ditches, which form a very agreeable public walk. Besides the suburbs outside the walls, Rostock is divided into an old, a middle, and a new town, and has in general an antique and picturesque appearance, somewhat like that of Lubeck. The old town is the most irregular, and the middle town the handsomest portion. The principal square bears the name of Blücher, and contains a statue in brass of that hero, who was a native of the town. The church of St Mary, a Gothic building, contains a monument to the celebrated Grotius, who died here in 1645; and another in memory of the Mecklenburg soldiers, who fell in the campaign of 1812 against Russia. The church of St Peter has a tower 420 feet high, which is visible to navigators about 20 miles off the coast. Another notable edifice is the singular-looking town-hall, with its seven pinnacles. The university of Rostock, founded in 1419, is the national one of the duchy, and had in 1856, 32 professors and teachers, and 97 students, some of the former men of much celebrity. Attached to the university are a library of 80,000 volumes, a museum, an observatory, and various preparatory seminaries. Rostock has also a ducal palace, theatre, nunnery, &c. The manufactures of the town are many and various, as there are cotton factories, a paper-mill, a sugar-house, ship-building yards, &c.; and the trade and navigation are of the greatest importance. Warnemunde, on the Baltic, is the harbour of the town, and it admits vessels drawing 8 feet of water. Communication is kept up by steamers: and the place, though but a small village, is much frequented in summer for the sake of the sea-bathing. The number of vessels belonging to the port was, in 1857, 324. The number of ships that entered in 1855 was 501, and those that cleared 572. The total quantity, in cwt., of the exports and imports by sea, at Rostock, in 1852, is exhibited in the following table:—

	Imported.	Exported.
Articles of consumption.. cwt.	10,678	730,068
Raw materials.....	235,850	36,036
Half-manufactured goods....	22,204	71
Manufactured goods... ..	395	1
Works of art and industry..	12,806	452
Total	381,933	766,628

Rostopchin
||
Rota.

The transit trade of the town amounted in the same year to 31,379 cwt. in all. The most part of the goods exported from Rostock go to England, Sweden, and Holland; and the imports come from these countries, and from Denmark. Rostock is a place of much antiquity. It was raised to the rank of a city in 1030, and at a later period became a member of the Hanseatic League, but left that confederacy in 1492. It still retains the right of coining money, along with several other privileges; and is the seat of an exchange and a bank for the duchy. Pop (1855) 24,228.

ROSTOPCHIN, or RASTOPCHIN, FEDOR, *Count*, who was born in 1765 is celebrated from his having been the commander-in-chief of Moscow in 1812, when that city was burned. His connection with the conflagration has been the subject of much controversy. The point of dispute is, whether he was or was not the incendiary. In support of the former supposition there is the presumption that the flames were far too opportune in their outbreak, summary in their devastations, and successful in their results, to be the effect of anything else than one designing and overruling mind. In support of the latter there is the fact, that the governor himself, in 1823, while residing in Paris, published a pamphlet disclaiming the honour of being the author of such a pregnant event in the world's history, and attributing the fire to the patriotism of a few isolated Russians. Rostopchin died at Moscow in 1826. He left behind him, among other works, an autobiography, entitled *Memoirs written in Ten Minutes*.

ROSTOV, a town of European Russia, capital of a circle in the government and 40 miles S.S.W. of Jaroslav, on a lake of the same name. It is an ancient and extensive town, and consists of the city, encircled by a wall and moat, along with suburbs on the outside. There is an old citadel, a cathedral with many costly ornaments, 23 other churches, 5 convents, 6 poor-houses, and 2 schools. The Archbishop of Jaroslav resides here in a large palace, with a seminary attached to it. Various important manufactures are carried on, especially of linen cloth and candles. A much-frequented market is held annually for three weeks in February and March. Pop. 9598.

ROSTOV, a fortified town of European Russia, in the government and 223 miles E.S.E. of Jekaterinoslav, on the Don, about 22 miles above its mouth, in the Sea of Azov. It contains the fortress of St Demetrius, five churches, two schools, and two benevolent institutions. Several manufactures are carried on here, as well as ship-building and fishery. Two annual and much-frequented fairs are held here, and there is an extensive trade. Pop. 12,587.

ROSTRA. See FORUM.

ROTA, a seaport-town of Spain, Andalucia, in the province and 8 miles N.W. of Cadiz, at the N.W. extremity of the Bay of Cadiz. It has a castle, a town-hall, a fine church in the Gothic style, several schools, hermitages, and a cemetery. There is also a good anchorage, and an excellent pier, 145 feet long. The people are chiefly employed in farming: wine is exported; coals and oil imported. Pop. 7997.

ROTA, the name of an ecclesiastical court of Rome which takes cognisance of all suits in the territory of the church, is composed of twelve prelates, of whom there must be a German, a Frenchman, two Spaniards, eight Italians, (three of whom must be Roman, a Bolognese, a Ferraran, a Milanese, a Venetian, and a Tuscan).

ROTATION.

Rotation.

ROTATION, in mechanical philosophy, denotes the motion of the different parts of a solid body about an axis, in contradistinction to the progressive motion of the body in a straight line, or in an orbit about a distant centre, of which the rotation is absolutely independent, although both motions may take place simultaneously. Thus the planets have a progressive motion, or a motion of translation, in the orbits which they describe about the sun, while at the same time each revolves about an axis which passes through its centre of gravity.

In consequence of this double motion of the planetary bodies, the two great problems in physical astronomy are, first, to determine the orbit described in space by each body under the influence of the sun's attraction, but disturbed by the attraction of every other body in the system; and, secondly, to determine the circumstances of the rotation of each body under the influence of the same disturbing forces. This last problem is not of less importance or difficulty than the first. In the case of the earth it includes the determination of the precession of the equinoxes and the nutation of the axis under the disturbing action of the sun and moon; and its analysis has led to the discovery of two important facts connected with the physical constitution of the universe, namely, the invariability of the length of the day, and the permanence of the poles of rotation on the earth's surface.

But the problem of determining the rotation of a solid body is not merely interesting in consequence of its forming a principal part of physical astronomy; it is also one of the highest importance in practical mechanics; for the principles to which we are led in considering the general theory of rotatory motion, enable us to determine the effect or performance of machines, and the proper relations and most advantageous disposition of their several parts, in order to accomplish the object in view with the smallest waste of force, and the least strain or injury to the machine itself.

In treating the subject, we shall first endeavour to demonstrate the fundamental propositions of rotatory motion in as elementary a manner as possible; secondly, we shall show the methods of computing the inertia of bodies of different forms, and the properties of principal axes; thirdly, we shall consider the motion of a body which revolves about a fixed axis, and the properties of the centres of gyration, percussion, and oscillation; and, lastly, we shall give the general equations which determine the rotation of a body acted upon by any number of forces, and which is at liberty to move in any direction.

General principles.

1. When a solid body, or system of material particles, so connected that their mutual distances remain invariable, turns round an axis, every particle describes a circle having its centre in the axis, and its plane perpendicular to the axis; and at every instant of the motion the particle is in the direction of a tangent to the circle, or in a straight line perpendicular to its radius vector. In order, therefore, to ascertain the direction of the motion of any particle of the system, we have only to draw a straight line from the particle perpendicular to the axis of rotation. This line will lie in the plane of the circle, and be its radius vector; and the perpendicular to the radius vector at its extremity gives the direction of the motion of the particle.

2. Since the system is supposed to be invariable in form, every particle describes the circumference of a circle in precisely the same instant of time; and as this is also true of any given portion of the circumference, it follows that the absolute velocities of the different particles are proportional to their distances from the axis of rotation. Hence,

if w denote the velocity of the particle whose radius vector or distance from the axis $= 1$, then rw is the velocity of the particle whose distance from the axis $= r$. The velocity denoted by w is called the *angular velocity* of the body; and the rotations of different bodies are compared in respect of velocity by comparing their angular velocities.

3. The nature of the forces which connect the different particles or atoms of a solid body, and render it impossible for any single particle to change its position without a corresponding change in the positions of all the other particles, is very obscurely known; but whatever their nature may be, there is one general fact or law, established by unexcepted experience, which affords a sufficient foundation for a dynamical theory, namely, that the forces by which the particles of a body act reciprocally on each other are equal. An immediate consequence of this law is, that when a solid body is in equilibrium between two external forces A and B , these forces are equal and opposite; for the force A being in immediate equilibrium with the opposite forces exerted by that particle of the solid body to which it is applied, must therefore be equal and opposite to the force resulting from the combination of all the forces which connect that particle with the series of particles immediately adjoining. In like manner, the compound force by which this first series of particles acts on that to which the external force A is applied, is equal and opposite to the compound force which connects this first series with the next series, and so on until we come to the particle to which the external force B is immediately applied. And this particle being in equilibrium, the external force applied to it must be equal and opposite to the compound force exerted on it by the series of contiguous particles on that side; therefore the two forces A and B are equal and opposite.

Hence it follows, that when any number of external forces are applied to a solid body, and it is in equilibrium between them, the forces are such as would be in equilibrium if they were all applied at one point.

4. If a body is maintained in equilibrium by the action of three forces, these forces lie in the same plane, and are either parallel, or meet in the same point. This follows immediately from the composition of forces; for the forces being in equilibrium, any one of the three must be equal and opposite to the equivalent, or *resultant*, as it is termed, of the other two; and this resultant is the diagonal of a parallelogram of which the other two *component* forces are the sides. But the diagonal and sides of a parallelogram are in the same plane, therefore the third force is in the plane of the other two; and, further, since it is equal and opposite to the resultant of the other two, it must be in the same straight line, and consequently pass through their point of concurrence. These simple propositions are the foundation of the theory of statics.

5. In applying these propositions to explain the motion of rotation, we must recollect a fundamental theorem in dynamics, that the force which produces any motion is equal and opposite to the force which would prevent it, if applied at the same point, and in the same straight line, or which would extinguish the motion in the same time in which we suppose it to be produced. The force therefore which, acting on any particle, causes the body to revolve about an axis with a given angular velocity, is equal to the force which, if applied at the same point in the opposite direction, would reduce the body to a state of rest in the same time as was necessary to produce the given velocity.

6. The only distinct notion we can form of the intensity of any moving force, is the quantity of motion which

Rotation.

Rotation. it can produce by acting uniformly during a given time. This will be ascertained when we know the velocity impressed upon a body containing a given quantity of matter. Thus we know that terrestrial gravity acting on a body for a second, will cause it to fall sixteen feet with an uniformly accelerated motion, and will leave it in a state such that it would move on for ever at the rate of thirty-two feet per second. The force of gravity is therefore such as to communicate a velocity of thirty-two feet per second; and in this case the mass of the body is not considered, for gravity acts equally on every particle of which it is composed. In the same manner, the best way of acquiring a distinct conception of the rotatory effect of a moving force, is to determine the quantity of rotatory motion which it can generate by acting uniformly during some known time.

Rotation of a solid body about an axis.

7. If a solid body, or rigid system of invariable form, admit of a rotatory motion about an axis, and if at any point of the body a force P be applied, which acts in a plane perpendicular to the axis of rotation, and tends to turn the body in one direction; and to any other point in the same plane a force Q be applied, tending to turn the body in the opposite direction; then, if the two forces be to each other inversely as the distances of the lines of their directions respectively from the axis, the body will remain at rest, or the two forces will be in equilibrium.

For let O (fig. 1) be the axis of rotation, and suppose the force P to be applied at the point P in the direction PA , and tending to turn the solid body about the axis O perpendicular to the plane of the paper, and let the force Q act in the direction QB , and consequently tend to turn the body in the opposite direction, and draw OA perpendicular to PA , and OB perpendicular to QB . Then, in order that there may be equilibrium, we must have, by the principle of the lever, $P : Q :: OB : OA$, whence $P \cdot OA = Q \cdot OB$.

Fig. 1.

8. It is obviously indifferent at what point of the plane the force is applied, provided its distance from the axis remains the same. Let BO therefore be produced, and take OC equal to OA , and draw CR perpendicular to BC , or parallel to BQ . We may now suppose the force P to be replaced by an equal force R , acting in the direction RC ; then, since $R \cdot OC = P \cdot OA$, we have $R \cdot OR = Q \cdot OB$, and, consequently, the axis being supposed fixed, the body will remain in equilibrium between the two forces Q and R . These forces are therefore equivalent to a single force applied at O , equal to their sum, and acting in a parallel direction. Hence the resultant of two parallel forces applied to a straight line is a force parallel to the component forces, equal to their sum, and whose line of direction divides the straight line into parts reciprocally proportional to the forces themselves.

9. If two forces, which are inversely as the distances of their respective directions from the axis of rotation, be applied to a body, the equilibrium will still be maintained, although the two forces are not in the same plane. Let OO' be two points in the axis of rotation, through which let there be drawn two planes Aa and Bb at right angles to the axis. Suppose also these planes to be intersected by another plane (here supposed to be the plane of the figure) passing through the axis, and let OA, OB be the intersections, and let the straight line which joins A and B intersect the axis in C . Let P and Q be two forces applied respectively at A and B in the planes AOa and BOb , and at right angles to OA and OB , or perpendicular to the plane of the paper, then these two forces are parallel; and because by hypothesis $P : Q :: OB' : OA$,

Fig. 2.

we have $P : Q :: CB : CA$; therefore (8) the two forces P and Q are equivalent to a single parallel force passing through C . But a force passing through the axis has no tendency to turn the body round the axis; consequently the body remains at rest.

10. Let $m, m', m'', \&c.$ (fig. 3) be a system of bodies immoveable in respect of each other, and suppose them to revolve about an axis passing through O ; also let $m, m', m'', \&c.$ denote the quantities of matter in the bodies respectively, and let $r, r', r'', \&c.$ denote their distances from the axis of rotation. Let the angular velocity of the system be ω ; then (2) the absolute velocities of the bodies are respectively $\omega r, \omega r', \omega r'', \&c.$ Now let us suppose the system to be put in motion by an external force F applied at the point P , in the direction PA , which is contained in a plane perpendicular to the axis of rotation; then the relation between the force F and the velocity ω may be found as follows. Considering, first, the body m ; since its velocity $= \omega r$, and its quantity of matter $= m$, its quantity of motion $= \omega r m$. But it is a principle in dynamics, that the quantity of motion of a moving body is proportional to the impressed force, and may be taken as a measure of that force; whence $\omega r m$ is the measure of a force which, if applied at m , in a direction perpendicular to Om , would cause m to begin to move with the actual velocity ωr . Let f be the force which, if applied at P in the direction PA , would make equilibrium with the force $\omega r m$ at m ; draw OA perpendicular to PA , and make $OA = h$. We have then (7)

$$f : \omega r m :: Om : OA :: r : h,$$

whence $f h = \omega r^2 m$. In like manner, the quantities of motion in the bodies $m', m'', \&c.$ are $\omega r' m', \omega r'' m'', \&c.$; and if we denote by $f', f'', \&c.$ the forces which, if applied at P in the direction PA , would respectively make equilibrium with the forces $\omega r' m', \omega r'' m'', \&c.$ we shall have $f' h = \omega r'^2 m', f'' h = \omega r''^2 m'', \&c.$; therefore, if we assume

$$F = f + f' + f'' + \&c.$$

we shall have the equation

$$F \cdot h = \omega (r^2 m + r'^2 m' + r''^2 m'' + \&c.).$$

If we suppose $m = m' = m'' = \&c.$ and take r to denote the distance of any particle from the axis of rotation, the equation becomes $F \cdot h = \omega \Sigma (r^2 m)$; the summation denoted by Σ extending to every particle in the system.

11. When the direction of the external force F is not in a plane parallel to the circles of rotation, it must be resolved into two forces, one of which lies in that plane, and the other is parallel to the axis. It is only the first of these forces which in the present case is regarded as the moving force; the second merely tends to push the body in the direction of the axis, and does not influence the rotation. When we come to consider the rotation of a body perfectly free, it will be necessary to attend particularly to this circumstance.

12. A solid body may be regarded as composed of molecules of a very small but finite magnitude, connected so as to form an invariable system; and although a solid, according to his view of the constitution of body, is formed of discrete elements, the sums relative to the molecules may be changed into definite integrals without sensible error; that is to say, for the sums $\Sigma r^2 m$ we may substitute the definite integrals $\int r^2 dm$, where dm is the element of the mass, and the integrals extend to the whole mass. We have then $F \cdot h = \omega \int r^2 dm$.

13. The energy of a force applied to a lever, or its power of producing motion round the fulcrum, is expressed by the product of the force into the perpendicular drawn from the fulcrum upon the line of its direction. This product (denoted above by $F \cdot h$) is called the *moment*, or *momentum*, or *rotatory effort*, of the force F . And because $\int r^2 dm$ is

Rotation.

Fig. 3.

Rotation. the sum of the moments of all the particles of the body in actual motion, this integral expresses the energy or effort of all the resistances made to the rotation by the inertia of the particles, and is therefore called the *moment of inertia* of the moving body with respect to the axis from which the distances r are reckoned. We have therefore these definitions:

The *moment of a force* in respect of a given axis, is the product of the force into the perpendicular from the axis upon the line of its direction.

The *moment of inertia* of a body in respect of any axis is the sum of the products obtained by multiplying each particle of the body into the square of its distance from the axis.

14. From the equation $F \cdot h = wfr^2 dm$ (12), we have the following expression for the angular velocity, namely,

$$w = \frac{F \cdot h}{\int r^2 dm};$$

that is to say, the angular velocity about any axis is equal to the moment of the external or applied force divided by the moment of inertia. This fraction expresses a number; for the force F may be represented by the product of a mass M into a certain velocity $= v$, so that $F = Mv$; and therefore, since v represents a line, the numerator and denominator have both the same dimension. The fraction also expresses the part of the radius which is equal to the arc measuring the angle; and since the radius is equal to the arc of $57^\circ 29' 58''$, if we make the radius $= 1$, we have only to multiply the fraction by $57 \cdot 2958$ in order to obtain the value of w in degrees.

15. Since the relation between the angular velocity and the external impelling force is expressed in terms of the moment of inertia, it is evident that this moment is an important element in the theory of rotation. We shall therefore now proceed to consider the subject under a more general view, and point out the method by which it is computed for bodies of any form revolving about given axes.

Let the different points of a solid body be referred to three rectangular co-ordinates x, y, z , and let dm be the differential element of the mass; then the distance of any particle from the axis x is $\sqrt{(y^2 + z^2)}$, and, by the definition, the moment of inertia relative to the axis x , is $\int (y^2 + z^2) dm$, the integral extending to the whole mass of the body. In like manner, the moments of inertia relative to the axes y and z are respectively $\int (x^2 + z^2) dm$ and $\int (x^2 + y^2) dm$. It is thus evident that the determination of the moments of inertia, with respect to any body whatever, consists in forming the analytical expression of the product of the differential element of the body into the square of its distance from the axis, and integrating for the whole extent of the body. The integration may always be effected by the method of quadratures.

16. Since the same body may be referred to an infinite number of different axes, in respect of all of which the moments of inertia will have different values, it follows that the moment cannot be absolutely defined unless it be referred to a determinate axis. But when it is required to investigate the moments of inertia of a body in respect of several axes successively, it is not always necessary to compute the formula $\int r^2 dm$ for each case. For example, when the moment of inertia has been determined in respect of any one axis, we may find its value in respect of any other parallel axis without further calculation, if we know the mass of the body and the distances of both axes from the centre of gravity.

17. The moment of inertia of any body in respect of an axis AO (fig. 4) being given, to find the moment of inertia in respect of another axis oa parallel to OA .

Let the origin of the rectangular co-ordinates be at O , and let x be taken on the axis OA , and y in the plane of

Rotation. OA and oa . Also let Z be the place of an element dm , and Y the projection of Z on the plane xy ; and from Y draw YX perpendicular to OA , meeting OA in X and oa in x ; then $OX = x$, $XY = y$, $YZ = z$. The moment of inertia in respect of the axis OA is $\int r^2 dm = \int (y^2 + z^2) dm$. But by hypothesis this is given; suppose it $= Mh^2$ (M being the mass of the body), and we have $\int (y^2 + z^2) dm = Mh^2$. In like manner, if we assume the distance of oa from OA to be k , we have $ox = x$, $xy = k + y$, $YZ = z$, and the moment of inertia in respect of oa is $\int \{(k + y)^2 + z^2\} dm = k^2 \int dm + 2k \int y dm + \int (y^2 + z^2) dm$. But $\int k^2 dm = Mk^2$, and $\int (y^2 + z^2) dm = Mh^2$; therefore the moment in respect of the new axis is $Mh^2 + Mk^2 + 2k \int y dm$. Suppose the centre of gravity of the body to be at G ; let GF be perpendicular to the plane xy , and draw FE perpendicular to the axes, meeting OA in E and oa in e . From the nature of the centre of gravity $\int y dm = M \cdot EF$; therefore the moment in respect of oa becomes $Mh^2 + Mk^2 + 2k \cdot M \cdot EF$. But $k = eE$, and $2M \cdot k \cdot EF = 2M \cdot eE \cdot EF = M(eF^2 - k^2 - EF^2)$; whence we have finally for the moment of inertia in respect of the new axis oa ,

$$Mh^2 + M \cdot eF^2 - M \cdot EF^2.$$

Corollary 1. If the original axis OA passes through the centre of gravity G , then EF vanishes, and the moment in respect of the new axis oa becomes $Mh^2 + M \cdot eF^2$, or $Mh^2 + Mk^2$. And if oa passes through the centre of gravity, then eF vanishes, and the moment in respect of oa becomes $Mh^2 - MEF^2$. Hence we infer that the moment of inertia in respect of the axis which passes through the centre of gravity is less than the moment in respect of any other parallel axis.

Corol. 2. The moment of inertia is the same in respect of every axis parallel to that which passes through the centre of gravity, and is at the same distance from it; or the same in respect of every straight line which lies in the surface of a cylinder having the centre of gravity in its axis.

18. We shall now give a few examples of the application of the preceding formulæ.

I. Let it be proposed to find the moment of inertia of a very slender rod (the breadth and thickness of which may be neglected), in respect of an axis passing through its extremity and perpendicular to its length.

Let a = the length of the rod, and x = the distance of any point from the axis, then the element of the body is dx , and the moment of inertia $= \int x^2 dx$, the limits of the integral being $x = 0$ and $x = a$. For those limits we have $\int x^2 dx = \frac{1}{3} a^3$, which therefore is the moment of inertia.

II. To find the moment of inertia of a very thin rectangle, the thickness of which may be neglected, in respect of an axis coinciding with one of its sides.

Let the side which coincides with the axis $= a$, and the other side $= b$, and let x be taken in the axis. The co-ordinates of any point in the rectangle being x, y , the element of the body is $dx dy$, and the distance from the axis $= y$, therefore the moment of inertia is $\iint y^2 dx dy$. The integral of this in respect of x is $\int xy^2 dy$, which from $x = 0$ to $x = a$ gives $a \int y^2 dy$. A second integration gives $\frac{1}{3} ay^3$, which from $y = 0$ to $y = b$, becomes $\frac{1}{3} ab^3$; therefore, since $M = ab$, $\iint y^2 dx dy = \frac{1}{3} ab^3 = \frac{1}{3} M \cdot b^2$.

III. To find the moment of inertia of a circle in respect of one of its diameters.

Let a be the radius of the given circle, r = the radius of a concentric circle passing through a point P whose co-ordinates are x and y , x being taken on the axis of rotation, and $r + dr$ the radius of a second concentric circle, very near the other. If we now assume $dx = \sqrt{(a^2 - y^2)}$, then $dx \cdot dr$ is the area of the elementary surface included between

Fig. 4.

Examples of the computation of moments of inertia.

Rotation. the circumferences of the two circles whose radii are respectively r and $r + dr$, and two straight lines drawn from the centre to the extremities of a very small arc at P; that is to say, we have $dm = dzdr$. But the distance of this element from the axis is y ; therefore the moment of inertia is $\int y^2 dzdr$. Now, by the nature of the circle, $dz : dx :: r : y$, whence $ydz = rdx$, and the double integral becomes $\int y dx \times \int r dr$. Now, on the supposition that r is constant, the integral $\int y dx = \pi r^2 =$ area of the circle whose radius is r ; therefore the integration in respect of dx gives $\pi \int r^3 dr$; and on integrating this from $r = 0$ to $r = a$, we get ultimately $\frac{1}{4} \pi a^4$ for the moment of the circle whose radius is a .

Since in this case the mass $M = \pi a^2$ = the area, we have $\frac{1}{4} \pi a^4 = \frac{1}{4} M a^2$, which is another expression for the moment of inertia of a circle in respect of one of its diameters.

IV. To find the moment of inertia of a circle in respect of an axis perpendicular to its plane, and passing through its centre.

Supposing, as in the last proposition, the surface to be composed of elementary rings, we have $dm = dzdr$, whence $\int r^2 dm = \int r^2 dr \times \int dz = 2\pi \int r^3 dr$ (since $\int dz = 2\pi r$), the integral of which, from $r = 0$ to $r = a$, gives $\int r^2 dm = \frac{1}{2} \pi a^4 = \frac{1}{2} M a^2$.

V. To find the moment of inertia of a solid body generated by the revolution of a curve line in respect of the axis of rotation.

Let AB (fig. 5) be a section perpendicular to the axis of rotation OX, and meeting it in C, and make OC = x . Suppose the solid to be divided into thin slices by planes parallel to AB, and let ab be the section next to AB, so that $Cc = dx$. Let P be a point in the plane AB, and make CP = r , Cp = $r + dr$. The length of the circumference described by P in one revolution is $2\pi r$, therefore the mass of the ring comprised between AB and ab , and traced by the revolution of the points P and p, is $2\pi r dr dx$; and its distance from the axis is r , therefore the moment of inertia of the ring is $2\pi r^3 dr dx$. Integrating this in respect of r from $r = 0$ to $r = CA = y$, we get $\frac{1}{2} \pi y^4 dx$ for the moment of the slice comprised between the two sections of the solid, whose distances from O are x and $x + dx$. Hence the moment of inertia of all the slices, or of the solid body, is $\frac{1}{2} \pi \int y^4 dx$.

Applying this formula to a sphere whose radius = a , we get from the equation $y^2 = 2ax - x^2$, $y^4 = 4a^2 x^2 - 4ax^3 + x^4$, on substituting which, and integrating, we have $\frac{1}{2} \pi \int y^4 dx = \frac{2}{5} \pi a^2 x^3 - \frac{1}{2} \pi a x^4 + \frac{1}{10} \pi x^5$, which from $x = 0$ to $x = a$ gives $\frac{1}{2} \pi \int y^4 dx = \frac{8}{15} \pi a^5$ for the hemisphere, and consequently the moment of inertia of the whole sphere = $\frac{8}{15} \pi a^5 = \frac{2}{5} M \cdot a^2$, since $M = \frac{4}{3} \pi a^3$.

The moment of inertia of a spheroid revolving about its shorter axis is $\frac{1}{5} M (a^2 + b^2)$. See the calculation of $\int x^2 dm$ and $\int y^2 dm$ in this case in the article PRECESSION, vol. xviii. p. 508.

In all the preceding examples, the density of the body has been supposed uniform, and = 1. For bodies of different densities the formulæ must be multiplied in each case by the density. Thus, in the last example, the moment of inertia of a sphere whose radius = a , and density = ρ , the moment of inertia in respect of one of the diameters is $\frac{8}{15} \pi \rho a^5$.

19. The examples which have now been given will suffice to illustrate the method of computing the moments of inertia of bodies of any form in respect of particular axes; and they render it obvious that the computation will in general be greatly facilitated when the mass is symmetrically disposed about the axis for which the inertia is to be computed. It is likewise evident that the amount of rotatory inertia de-

pends on the position of the axis of rotation. Hence, for every point of a mass there must exist at least one axis in respect of which the inertia is less, or greater, than in respect of any other axis passing through that point. The axes for which the moments of inertia are the greatest or least possible are called *principal axes*; and they possess some very remarkable properties of great importance in the theory of rotation. We now proceed to investigate the position and properties of the principal axes.

20. The moments of inertia of a mass M being given in respect of three rectangular axes OX, OY, OZ (fig. 6) passing through O, to find the moment in respect of another axis OG given in position, and also passing through the origin O.

Let P be the position of a particle dm ; through P draw PQ parallel to the axis OZ, meeting the plane XOY in Q, and draw QR parallel to OY, meeting OX in R; then OR = x , RQ = y , QP = z . Also suppose the plane which passes through OG, and is perpendicular to XOY, to meet the plane XOY in OF, and let the angle XOF = ϕ , and the angle FOG = ψ . The axis OG is entirely determined by these two angles, and consequently, when OG is given in position, ϕ and ψ are also given. In order to compute the moment of inertia in respect of the axis OG, it is convenient to refer the different points of the mass, as P, to a new system of rectangular axes, of which one is OG. To effect this, in the first place let OY be drawn perpendicular to OF in the plane XOY, and let P be referred to the axes OF, OY', OZ, and draw QR' perpendicular to OF. We have then OR' = x' , R'Q = y' , QP = z , and the new co-ordinates expressed in terms of the former, and the angles ϕ and ψ are

$$x' = x \cos. \phi + y \sin. \phi, \quad y' = y \cos. \phi - x \sin. \phi, \quad z' = z.$$

In the second place, we may pass in like manner from these to a third system of co-ordinates x'', y'', z'' , of which x'' is in the line OG, y'' remains parallel to OY', and z'' is perpendicular to OG in the plane FOG. We have, then, similarly,

$$x'' = x' \cos. \psi + z' \sin. \psi, \quad y'' = y', \quad z'' = z' \cos. \psi - x' \sin. \psi.$$

Substituting in these last equations the values of $x', y',$ and z' , given by the three former, we have

$$\begin{aligned} x'' &= x \cos. \phi \cos. \psi + y \sin. \phi \cos. \psi + z \sin. \psi, \\ y'' &= y \cos. \phi - x \sin. \phi, \\ z'' &= z \cos. \psi - x \cos. \phi \sin. \psi - y \sin. \phi \sin. \psi. \end{aligned}$$

If we now assume the distance of P from the axis OG to be r , we shall have $r^2 = y''^2 + z''^2$; whence, on forming from the two last equations the expression for $\int r^2 dm = \int (y''^2 + z''^2) dm$, and, for the sake of abridging, putting

$$\begin{aligned} \int x^2 dm &= A, \quad \int y^2 dm = B, \quad \int z^2 dm = C, \\ \int xy dm &= D, \quad \int xz dm = E, \quad \int yz dm = F, \end{aligned}$$

the expression for the moment of inertia in respect of the axis OG becomes

$$\begin{aligned} \int r^2 dm &= A (\sin.^2 \phi + \cos.^2 \phi \sin.^2 \psi) \\ &+ B (\cos.^2 \phi + \sin.^2 \phi \sin.^2 \psi) + C \cos.^2 \psi \\ &- 2 D \cos. \phi \sin. \phi \cos. \psi - 2 E \cos. \phi \cos. \psi \sin. \psi \\ &- 2 F \sin. \phi \cos. \psi \sin. \psi. \end{aligned}$$

This expression for the moment of inertia in respect of the axis OG is given by Euler (*Theoria Motus Corporum Solidorum*, p. 169).

21. The values of the angles ϕ and ψ , which give the position of the axis for which the moment $\int r^2 dm$ is a maximum or minimum, may be deduced from the above equation in the usual manner, that is to say, by differentiating successively for each of the variables, and making the differential co-efficient = 0. The differentiation in respect of ϕ (supposing ψ constant) gives the equation

$$\tan. \psi = \frac{-(A - B) \sin. \phi \cos. \phi + D (\cos.^2 \phi - \sin.^2 \phi)}{E \sin. \phi - F \cos. \phi},$$

Fig. 5.

Fig. 6.

Rotation. and the differentiation in respect of ψ (supposing ϕ constant) gives

$$\begin{aligned}\tan. 2\psi &= \frac{2 \tan. \psi}{1 - \tan.^2 \psi} \\ &= \frac{2 E \cos. \phi + 2 F \sin. \phi}{A \cos.^2 \phi + B \sin.^2 \phi - C + 2 D \cos. \phi \sin. \phi}.\end{aligned}$$

On eliminating ψ from these two equations, there results an equation of the following form, in which $u = \tan. \phi$, and e, f, g, h are co-efficients depending upon the quantities A, B, C, D, E, F , viz.

$$0 = e + fu + gu^2 + hu^3.$$

This being a cubic equation, must have at least one real root. But it is easy to see, from the nature of the thing, that all the roots are real; for if there be one axis for which the moment of inertia is a *maximum*, there must evidently be a second, in respect of which it is a *minimum*, and *vice versa*. Hence the equation must have two real roots, and therefore, by the theory of cubic equations, all the roots are real. We are therefore led to this very important conclusion, that through any point of every solid body, however irregular in its form, there may be drawn a system of three axes, such that the differential co-efficient of the moment of inertia in respect of each of them is nothing. In respect of one of these, the moment is a maximum, in respect of another, it is a minimum, and though, in respect of the third it is neither a maximum nor a minimum, it is still such that its value is not altered by a small change in the position of the axis. According to the definition in (19), these are the *principal axes* of the body.

Properties
of principal
axes.

22. It would be difficult, in general, to determine the position of the principal axes from the cubic equation found above; but they possess certain properties, by means of which they may be readily found in almost every case of practical application. On comparing the two equations for $\tan. \psi$ and $\tan. 2\psi$ (21), with the expressions for x', y', z' (20), it will be seen that the first is identical with $2 \cos. \psi \int x' y' dm$, and the second with $-2 \int x' z' dm$; whence $\int x' y' dm = 0$, and $\int x' z' dm = 0$; and it follows, that if x be taken in one of the principal axes, we have, in respect of that axis, $\int x y dm = 0$, $\int x z dm = 0$, or the quantities denoted by D and E respectively vanish.

23. From this it follows, that if all the matter in a body of uniform density be symmetrically disposed about any line, that line is one of the principal axes of rotation (for if x be taken in the axis of symmetry, then to every element whose co-ordinates are x, y , there corresponds another element whose co-ordinates are $x, -y$, whence $\int x y dm = 0$); therefore, in the case of symmetrical figures, the position of one of the principal axes is known, and the positions of the other two are thence readily determined by means of the two equations (21). On making $D = 0, E = 0$, the first of these equations gives

$$(A - B) \sin. \phi \cos. \phi - F \cos. \phi \tan. \psi = 0,$$

whence $\cos. \phi = 0$, and $\sin. \phi = 1$; or $\phi = 90^\circ$. Substituting this value of ϕ in the second of the equations (21), and making at the same time $D = 0, E = 0$, we get $\tan. 2\psi = 2F \div (B - C)$; or 2ψ is the angle which has $2F \div (B - C)$ for its tangent. Hence the angle ψ has a double value, one corresponding to FOG , and the other to $FOG + 90^\circ$.

24. Hence also it appears, that when one principal axis OX is determined, two others may be found having the same property of maximum or minimum, and, by reason of $\phi = 90^\circ$, these axes are both in a plane perpendicular to OX . As this conclusion holds good with respect to each of the three axes, it follows that the three principal axes are at right angles to each other, and also, since $\int x y dm = 0$, and $\int x z dm = 0$, that $\int y z dm = 0$. We have therefore, in respect of the principal axes, the three equations

$$D = \int x y dm = 0, E = \int x z dm = 0, F = \int y z dm = 0.$$

VOL. XIX.

If the origin of the co-ordinates is placed at the centre of gravity, we have likewise

$$\int x dm = 0, \int y dm = 0, \int z dm = 0,$$

by the well-known property of the centre of gravity.

25. By means of these equations, the proposition in (20) is considerably simplified when the three axes for which the momenta are respectively given are principal axes. Let OX, OY, OZ (fig. 6) be the three principal axes passing through O , then $D = 0, E = 0, F = 0$, and the equation (20) for the moment, in respect of the axis OG , becomes

$$\begin{aligned}\int r^2 dm &= A (\sin.^2 \phi + \cos.^2 \phi \sin.^2 \psi) \\ &+ B (\cos.^2 \phi + \sin.^2 \phi \sin.^2 \psi) + C \cos.^2 \psi.\end{aligned}$$

Suppose the given moments in respect of the principal axes to be respectively $M \cdot a^2, M \cdot b^2, M \cdot c^2$; then, from the values of A, B, C (20) we have $M \cdot a^2 = B + C, M \cdot b^2 = A + C, M \cdot c^2 = A + B$, whence

$$\begin{aligned}A &= \frac{1}{2} M (b^2 + c^2 - a^2), B = \frac{1}{2} M (a^2 + b^2 - c^2), \\ C &= \frac{1}{2} M (a^2 + c^2 - b^2),\end{aligned}$$

on substituting which in the above equation, we get

$$\int r^2 dm = M (a^2 \cos.^2 \phi \cos.^2 \psi + b^2 \sin.^2 \phi \cos.^2 \psi + c^2 \sin.^2 \psi).$$

If we now refer the new axis OG to the co-ordinates OX, OY, OZ , and make the angle $XOG = \alpha, YOG = \beta, ZOG = \gamma$, and observe that because the two planes XOF and FOG are at right angles, $\cos. \alpha = \cos. \phi \cos. \psi, \cos. \beta = \sin. \phi \cos. \psi, \cos. \gamma = \sin. \psi$, the equation becomes

$$\int r^2 dm = M (a^2 \cos.^2 \alpha + b^2 \cos.^2 \beta + c^2 \cos.^2 \gamma).$$

It is to be remarked, that as the co-ordinates are rectangular, $\cos.^2 \alpha + \cos.^2 \beta + \cos.^2 \gamma = 1$, so that the position of OG is determined by any two of these angles. If we therefore suppose the moments in respect of two of the principal axes to be equal, for example, if $a^2 = b^2$, the formula for the moment in respect of OG becomes

$$\int r^2 dm = M \cdot a^2 (1 - \cos.^2 \gamma) + M \cdot c^2 \cos.^2 \gamma.$$

Now when $\gamma = 90^\circ$, that is, when OG lies in the plane XOY , then $\int r^2 dm = M \cdot a^2$. Hence, if the moments in respect of the axes OX and OY be equal, the moment will be the same for every axis passing through O , contained in the plane XOY .

When the moments in respect of the three principal axes are equal, that is, when $a^2 = b^2 = c^2$, then

$$\int r^2 dm = M \cdot a^2 (\cos.^2 \alpha + \cos.^2 \beta + \cos.^2 \gamma) = M \cdot a^2,$$

so that the moment is the same in respect of any axis whatever which passes through O . Thus it appears, that for every point of a solid body there are either three principal axes of rotation only, or else an infinite number.

26. These conclusions are obviously true in the case of some simple figures. Thus, in the spheroid of revolution, the moments are equal in respect of every diameter which lies in the plane of the equator; and in the sphere they are the same in respect of any diameter whatever, the bodies being always supposed homogeneous. The existence of three principal axes in every body was first noticed by Segner in 1755, but demonstrated for the first time by Albert Euler, in a memoir which received the prize of the Academy of Sciences of Paris in 1760.

27. Having established these general propositions respecting the moments of inertia and principal axes of bodies endowed with a rotatory motion, we now proceed to consider more particularly the rotation of a solid body about a fixed axis.

When a force is impressed on a body which can only move round a fixed axis, the difference between the motion which actually takes place, and that which would take place if the body were free, is evidently owing to the connexion which its parts have with the axis, and to the action of the points of support upon the axis. This action must be viewed in the light of another external force, such that, if combined with the force impressed on the body, it would produce in the body unconnected with any fixed points the motion which actually takes place.

Rotation.

28. In order to determine the strain on the axis, let OY (fig. 7) be the axis of rotation, retained in a fixed position by the two pivots S, T, and suppose a force $= F$ applied to the body at P, in the direction PQ, which is supposed to lie in a plane perpendicular to OZ. In the plane perpendicular to the axis, and containing PQ, let the rectangular axes OX, OY be drawn, and let x, y, z be the co-ordinates of a particle dm , the projection of which on the plane XY is at A, and let r denote its distance from the axis of rotation, so that $r = OA = \sqrt{x^2 + y^2}$; also let ϕ = the angle which OA makes with OX. If we now suppose w to be the angular velocity communicated to the body, then rw is the velocity with which the point A revolves, and the direction of this velocity is in the perpendicular to OA, and from OX towards OY, whence the velocity of A in the direction OX is $-wy \sin. \phi$, and $wr \cos. \phi$ in the direction OY. But $r \sin. \phi = y$, and $r \cos. \phi = x$; therefore the velocity of A in the direction OX is $-wy$, and in the direction OY it is $+wx$. The quantities of motion in these directions are therefore respectively $-wydm$ and $+wx dm$; and the integrals of those expressions extended to the whole mass of the moving body give the whole quantities of motion in those directions, namely, $-wfy dm$, and $+wfx dm$. On denoting the mass by M, and the co-ordinates of its centre of gravity by x_1 and y_1 , we have (from the well-known expressions for these co-ordinates) $fy dm = My_1$, and $fx dm = Mx_1$, therefore $-wfy dm = -wMy_1$, and $+wfx dm = +wMx_1$.

29. Now, since the body is supposed to be put in motion by a force F acting in a plane parallel to XOY, let α and β be the angles which its direction makes with parallels to OX and OY respectively; then the components of F in those directions are $F \cos. \alpha$ and $F \cos. \beta$. But these two forces are evidently equal respectively to the two former, together with the pressures on the pivots estimated in the same directions; therefore, calling p and q the pressures sustained by the point S in the directions OX and OY, and p', q' the pressures sustained by T in the same directions, we shall have

$$p + p' = F \cos. \alpha + wMy_1, \quad q + q' = F \cos. \beta - wMx_1.$$

In order to determine p, p', q, q' , it is still necessary to find two other equations. These will be obtained by considering, that in respect of the plane XOY, the moments of the forces acting on the two pivots, resolved in the directions x and y , must be equal to the moments of the resultants of all the forces or quantities of motion due to the rotation estimated in the same directions. Let $h = OS$, and $h' = OT$, the moments of the resolved forces which act on the pivots in the directions parallel to OX and OY are $ph + p'h'$ and $qh + q'h'$; and the resultants of the quantities of motion in the same two directions being $-wfy dm$ and $+wfx dm$, their moments in respect of the plane XOY are respectively $-wfy_1 dm$ and $+wfx_1 dm$; therefore

$$ph + p'h' = -wfy_1 dm, \quad qh + q'h' = +wfx_1 dm.$$

Combining these with the preceding two equations, p, p', q, q' are obtained in terms of known quantities.

30. If the axis of rotation OZ be one of the principal axes of the system which intersect at O, then, by (24), $fy_1 dm = 0$ and $fx_1 dm = 0$, whence $ph + p'h' = 0$, and $qh + q'h' = 0$, and consequently h and h' both vanish, and the percussions sustained by the axis pass through the origin O. Let R represent the single force or shock which the axis supports in this case, and ϕ the angle which its direction makes with the axis OX; then, by (29), $R \cos. \phi = F \cos. \alpha + wMy_1$, $R \sin. \phi = F \cos. \beta - wMx_1$, from which two equations R and ϕ are both determined.

31. It would be a desirable thing in machines which

Fig. 7.

derive their efficacy from a rotatory motion, to apply the pressures arising from the power and from the resistance opposed by the work in such a manner as to annihilate or diminish this pressure on the supports of the axis of motion. Attention to this theorem will point out what may be done; and it is at all times proper, nay necessary, to know what are the pressures in the points of support. If we are ignorant of this, we shall run the risk of our machine failing in those parts; and our anxiety to prevent this will make us load it with needless and ill-disposed strength. In the ordinary theories of machines, deduced entirely from the principles of equilibrium, the pressure on the points of support (exclusive of what proceeds from the weight of the machine itself) is stated to be the same as if the moving and resisting forces were applied immediately to these points in their own directions. But this is in all cases erroneous; and, in cases of swift motions, it is greatly so. We may be convinced of this by a very simple instance. Suppose a line laid over a pulley, and a pound weight at one end of it, and ten pounds at the other; the pressure of the axis on its support is eleven pounds, according to the usual rule; whereas we shall find it only $3\frac{1}{11}$. For the direction of the pressure R being in this case parallel to the axis y , and the force F also acting in the same direction, we have $\cos. \phi = 0 \cos. \alpha = 0$, $\sin. \phi = 1$, $\cos. \beta = 1$, $y_1 = 0$, and the two equations of (30) give the single equation

$$R = F - wMx_1.$$

If we now call the radius of the pulley 1, the moment of the moving force is $10 \times 1 - 1 \times 1 = 9$; and the moment of inertia (13) is $10 \times 1^2 + 1 \times 1^2 = 11$; therefore (14) the angular velocity $w = \frac{9}{11}$. But the distance of the centre of gravity from the axis of motion is also $\frac{9}{11}$, because the two weights may be supposed in contact with the circumference of the pulley; therefore, since $M = 11$, $wMx_1 = \frac{9}{11} \times \frac{1}{11} \times \frac{9}{11} = \frac{81}{121}$. Now $F = 10 + 1 = 11$, therefore $R = 11 - \frac{81}{121} = \frac{1340}{121} = 3\frac{1}{11}$ pounds, which is the pressure sustained by the axis.

32. If we suppose $R = 0$, the two equations (30) will express the conditions that must be fulfilled in order that the axis may receive no shock from the action of the impressed force F. This supposition gives the equations

$$F \cos. \alpha = -wMy_1, \quad F \cos. \beta = wMx_1,$$

from which, since $\cos. \beta = \sin. \alpha$, we deduce

$$-y_1 \sin. \alpha = x_1 \cos. \alpha, \text{ or } -y_1 \tan. \alpha = x_1.$$

Now, if a plane be conceived to pass through the axis OZ and the centre of gravity of the body, and if we denote by ψ the angle which it makes with the plane XOZ, we shall have $x_1 = y_1 \tan. \psi$; and therefore, since $x_1 = -y_1 \tan. \alpha$, $\tan. \psi = -\tan. \alpha$. From this equation it follows that the direction PQ of the impressed force is perpendicular to the plane which passes through the axis and the centre of gravity. It now remains only to find the distance of the point of impulse P from the axis. Let h = this distance, and r_1 = distance of centre of gravity from the axis; the above equations give $F^2 \cos.^2 \alpha = w^2 M^2 y_1^2$, $F^2 \sin.^2 \alpha = w^2 M^2 x_1^2$, whence $F^2 = w^2 M^2 (x_1^2 + y_1^2) = w^2 M^2 r_1^2$, and $F = wMr_1$. But (14) $w = F \cdot h \div \int r^2 dm$; therefore, by substitution,

$$F = F \cdot h \cdot Mr_1 \div \int r^2 dm, \text{ and consequently } h = \frac{\int r^2 dm}{Mr_1}.$$

33. Hence it appears that the conditions which must be fulfilled in order that the axis may receive no shock when the body is struck, are, 1st, that the direction of the force be in the plane of the two axes which make with the axis of rotation a system of principal axes; 2d, that its direction be perpendicular to the plane which passes through the axis and the centre of gravity; and, 3d, that the distance of the point of its application from the axis be $\frac{\int r^2 dm}{Mr_1}$.

34. The point determined by these conditions is called Centre of the centre of percussion of the system. The centre of per-
percussion.

Rotation.
Applica-
tion to ma-
chines.

Rotation. cussion is therefore the point at which, if an obstacle were opposed sufficient to resist the rotation of the system, no motion would be communicated to the axis; or, which is the same thing, if the axis were not fixed, the system would acquire from the shock no tendency to turn, the effect being the same as if the whole rotatory effort had been accumulated at that point.

Let HKL (fig. 8) be a section of the body perpendicular to the axis, and containing the centre of gravity G. Let O be the axis, and in the line OG take $OP = h = \frac{\int r^2 dm}{M \cdot OG}$, then P is the centre of percussion, and a force applied at P, in the plane HKL, and in the direction perpendicular to OP, will produce the same initial velocity of the centre of gravity G as if the body were free; for as the force exerts no pressure on the axis or points of support, the initial velocity will be the same as if they were not there.

35. The distance of the centre of percussion from the axis is always greater than the distance of the centre of gravity from the axis; for the moment of inertia in respect of the axis passing through O being $\int r^2 dm$, by (17) the moment of inertia in respect of the parallel axis passing through G is $\int r^2 dm - M \cdot OG^2$; therefore, since the moment of inertia is necessarily positive, $\int r^2 dm \geq M \cdot OG^2$. But by the definition $\int r^2 dm = M \cdot OG \cdot OP$, therefore $M \cdot OG \cdot OP \geq M \cdot OG^2$, or $OP \geq OG$.

36. The property of the centre of percussion, that a force applied there produces no strain on the axis, may be rendered sensible by a simple experiment. If a straight line, or rod of uniform thickness, be suspended from one extremity, the centre of percussion is at the distance of two thirds of its length from the axis; for the centre of gravity being at the middle of the line, $OG = \frac{l}{2}$, so that if we call its mass $M = 1$, the formula $OP = \frac{\int r^2 dm}{M \cdot OG}$ becomes $OP = \frac{2 \int r^2 dx}{l}$, which, on taking the integral from $x = 0$ to $x = l$, gives $GP = \frac{2}{3}l$. Now if the rod be held in the hand, and we give it a motion round the joint of the wrist only, and strike smartly against an obstacle with a point considerably nearer or more remote than two thirds of its length, we feel a painful shock or wrench in the hand; but if we strike with that point which is exactly at two thirds of its length, we feel no such disagreeable strain.

37. It is sometimes said that the point P, considered as the centre of percussion, is that with which the most violent blow is struck. But this is by no means true. P is that point of a body turning round O which gives a blow precisely equal to the progressive motion of the body, and in the same direction. As we have already said, it is the point where we may suppose the whole rotatory momentum of the body accumulated. Every particle of the body is moving in a particular direction, with a velocity proportional to its distance from the axis of rotation; and if the body were stopped in any point, each particle tending to continue its motion endeavours to drag the rest along with it. Whatever point we call the centre of percussion should have this property, that when it is stopped by a sufficient force, the whole motion and tendency to motion of every kind should be stopped; so that if at that instant the supports of the axis were annihilated, the body would remain in absolute rest.

38. The expressions in (29) for the stress on the axis have reference only to the initial movement of the body, and the forces which they represent are soon destroyed by the resistance of the axis. But when a body is in permanent rotation about a fixed axis, there is a strain exerted on the axis which depends only upon the centrifugal force of rotation, and which therefore continues as long as the rotation continues. This constant pressure is determined as follows: Since ω is the angular velocity, and r the distance

Fig. 8.

of a particle dm from the axis, the velocity of the particle $= \omega r$; and, by mechanics, the centrifugal force of a body moving in a circle is proportional to the square of the velocity divided by the radius; therefore the centrifugal force of the particle dm , in the direction of the radius r , is $\omega^2 r dm$. The resolved parts of this force in the directions OX and OY (fig. 7) are $\omega^2 x dm$ and $\omega^2 y dm$; therefore, denoting the pressures in those directions on the pivot S by p and q , and those on the pivot T by p' and q' , we shall have, as in (29), the following equations (in which x_1 and y_1 are the co-ordinates of the centre of gravity, and h, h' the distances of the pivots S and T respectively from O) to determine p, p', q, q' , viz.

$$p + p' = \omega^2 \int x dm = \omega^2 M x_1, \quad q + q' = \omega^2 \int y dm = \omega^2 M y_1, \\ p h + p' h' = \omega^2 \int x r dm, \quad q h + q' h' = \omega^2 \int y r dm.$$

If we suppose OZ to be one of the three principal axes passing through O, then $\int x r dm = 0$ and $\int y r dm = 0$; whence $p h + p' h' = 0, q h + q' h' = 0$. If, therefore, we further suppose $h = 0$, or that the origin of the co-ordinates is placed at S, we shall also have $p' = 0, q' = 0$, whence the pivot T sustains no pressure, the whole being exerted on S.

If OZ, besides being a principal axis, also passes through the centre of gravity, then $x_1 = 0, y_1 = 0$, whence $p + p' = 0, q + q' = 0$; and since p' and q' vanish when OZ is a principal axis, therefore $p = 0, q = 0$, so that no pressure is exerted on either of the pivots; and if they were removed, the body would still continue to revolve about the same axis.

The forces thus determined are in some sort the inverse of those arising from the percussions found in (29), the values of $p + p'$ being in this case expressed in terms of x , and in the former in terms of y ; and the value of $q + q'$, which in the case of the percussions was expressed in terms of x , is here given in terms of y .

39. In computing the effect of machines, it is often convenient to determine the situation of a point in which the whole mass of the machine might be concentrated without altering the rotatory effort. In the straight line OG (fig. 8) suppose a point Q to be taken, such that $OQ^2 = \frac{\int r^2 dm}{M}$ = moment of inertia in respect of the axis O; then, if the whole matter in the body were collected at Q, a force applied at any point P in the line OG, would produce exactly the same angular velocity as if applied to the same point of the body having its natural form. For if the whole mass M were concentrated at Q, the moment of inertia would become $M \cdot OQ^2$ (13), and the moment of the force F applied at P is $F \cdot OP$; therefore the angular velocity (14) would be $\frac{F \cdot OP}{M \cdot OQ^2}$. But the angular velocity produced by the force F applied at P, the body having its natural form, is $\frac{F \cdot OP}{\int r^2 dm}$; therefore, since $M \cdot OQ^2 = \int r^2 dm$, the two expressions are equal, and the angular velocity is not altered by supposing the whole mass concentrated at Q.

40. The point Q is called the *centre of gyration* of the revolving mass; and since $OQ = \sqrt{\frac{\int r^2 dm}{M}}$, its distance from the axis O is found by extracting the square root of the quotient which is obtained by dividing the moment of inertia by the mass of the body. It is also connected with the centres of gravity and percussion by a simple relation. Suppose P to be the centre of percussion, then (34) $OP = \frac{\int r^2 dm}{M \cdot OG}$, therefore $OG \cdot OP = \frac{\int r^2 dm}{M} = OQ^2$; whence the distance of the centre of gyration from the axis of rotation is a mean proportional between the distances of the centre of gravity and percussion from the axis.

In a straight line or slender rod, as a working beam, or the spoke of a wheel in a machine, OQ is $\sqrt{\frac{1}{3}}$ of its length; for in this case $\int r^2 dm = \int r^2 dr = \frac{1}{3} r^3$; and r being the whole length, $M = r$; therefore $\sqrt{\frac{\int r^2 dm}{M}} = r \sqrt{\frac{1}{3}}$.

Rotation.

Rotation. In a circle or cylinder turning about its axis, $OQ = \frac{1}{2}$ the radius; for by (18) we have in this case $\int r^2 dm = \frac{1}{2} Mr^2$; therefore $\sqrt{\int r^2 dm} \div M = r \sqrt{\frac{1}{2}}$. But if the circle turns round one of its diameters, then $OQ = \frac{1}{2}$ the radius; for in this case $\int r^2 dm = \frac{1}{2} Mr^2$; therefore $\sqrt{\int r^2 dm} \div M = \frac{1}{2} r$.

In the periphery of a circle, or rim of a wheel, turning about a diameter perpendicular to its plane, $OQ = \text{radius}$; for $\int r^2 dm = r^2 \times 2\pi r = 2\pi r^3$, and $M = 2\pi r$; therefore $\sqrt{\int r^2 dm} \div M = r$.

A solid sphere turning round a diameter has $OQ = r\sqrt{\frac{2}{5}}$ for (18) the moment of inertia of the sphere is $\frac{8}{15} \pi r^5$; and the mass $M = \frac{4}{3} \pi r^3$; therefore $OQ = \sqrt{\frac{6}{15}} r^2 = r \sqrt{\frac{2}{5}}$.

Formulae
for accele-
rating
forces.

41. In what precedes, we have supposed that the force applied to a rigid system produces its effect by instantaneous impact, and then ceases to act, so that the motion communicated to the system is uniform. But if the action of the external force continues after the first impact, like the force of gravity on a falling body, the motion of the system will be accelerated. In the case of uniform velocity, it has been shown (14) that the angular velocity is equal to the moment of the applied force divided by the moment of inertia; that is, assuming F to denote the force, and P the perpendicular from the axis on the line of its direction, $\omega = P \cdot F \div \int r^2 dm$. Suppose now the body to be subjected to the action of an accelerating force, and let $d\omega$ be the increment of the angular velocity in the very small time dt . The increment of the actual velocity of the particle dm , the distance of which from the axis is r , is then $rd\omega$, and its accelerating force (the ratio of the increment of the velocity to the increment of the time) is $r \frac{d\omega}{dt}$. Its moving

force is consequently $\frac{d\omega}{dt} \cdot r dm$; and since the direction of

this force is perpendicular to r , its moment = $\frac{d\omega}{dt} \cdot r^2 dm$.

But the sum of all these moments, in respect of every particle dm , must be equal to the moment of the impressed force, continuing to act during the same instant of time,

therefore $\frac{d\omega}{dt} \int r^2 dm = P \cdot F$, whence $\frac{d\omega}{dt} = \frac{P \cdot F}{\int r^2 dm}$.

42. In the case of a heavy body oscillating about an axis by the force of gravity, let HKL be a section of the body passing through the centre of gravity G , and let the axis of suspension be at O , and perpendicular to the plane HKL . Also, let OX be horizontal, and OY vertical. Then the accelerating force being denoted by g ($g = 32$ feet in a second of time), the moving force in respect of a particle dm at A is $g dm$; and the direction of this force being parallel to OY , the distance of its direction from the axis is x ; therefore its moment = $gx dm$. The sum of all these moments is the moment of the whole gravitating force of the body, that is, $g \int x dm = P \cdot F$, and we have consequently, since $\int x dm = Mx_1$,

$$\frac{d\omega}{dt} \int r^2 dm = g M x_1, \text{ whence } \frac{d\omega}{dt} = \frac{g M x_1}{\int r^2 dm}.$$

When the centre of gravity is in the straight line OY , or in the vertical passing through the axis, then $x_1 = 0$, and the angular velocity is uniform, and the body, if it rest in that position, would have no tendency to turn. But suppose the centre of gravity to be drawn aside from the vertical, and let $OG = h$, and the angle $GOY = \theta$, then $x_1 = h \sin \theta$, and we have

$$\frac{d\omega}{dt} = \frac{g M h \sin \theta}{\int r^2 dm},$$

Rotation.

whence the acceleration of the angular velocity is proportional to the sine of the angle which the line OG makes with the vertical.

43. Suppose the whole mass of the body to be concentrated at a point S in the straight line OG ; we shall then have $r = OS$, $\int r^2 dm = M \cdot OS^2$, and the formula will become $\frac{d\omega}{dt} = \frac{g \sin \theta}{OS}$. Now, if the point S be chosen such that

$OS = \int r^2 dm \div M \cdot h$, then the two formulæ will be identical, and the solid body will oscillate exactly in the same time as if all its matter were united at the point S , and connected with the axis by an inflexible rod without weight, that is, in the same time as a simple pendulum, of which the length is OS .

Since $r^2 = x^2 + y^2$, and $M \cdot h = \int x dm$, this expression for OS may be put under the following form, in which it is usually exhibited, namely,

$$OS = \frac{\int (x^2 + y^2) dm}{\int x dm}.$$

44. The point S is called the *centre of oscillation*. On comparing the expression for OS with that for OP in (34), it will be seen that it is at the same distance from the axis as the centre of percussion. But the centre of oscillation is not, strictly speaking, limited to a single point; for it through S a line be drawn perpendicular to the plane HKL , or parallel to the axis of rotation, every point in this line will move with the same angular velocity as if it were entirely unconnected with the other points of the oscillating body, and the line itself is denominated the *axis of oscillation*. It is usual, however, to understand by the term *centre of oscillation*, the point S which is situated in the straight line, perpendicular to the axis, which contains the centre of gravity.

45. If we denote the moment of inertia of the body in respect of the axis which passes through G the centre of gravity, perpendicular to the plane HKL , by $M \cdot h^2$, then h is a given line; and if we also make $OG = k$, then (17) the moment of inertia in respect of the axis passing through O is $M(h^2 + k^2)$. Hence we find $OS = \frac{M(h^2 + k^2)}{M \cdot h}$ = $k + \frac{h^2}{k}$; and consequently $GS = \frac{h^2}{k}$. This formula

gives the distance of the centre of oscillation below the centre of gravity.

46. The point S possesses several very remarkable properties, one of which is, that as S is the centre of oscillation of the body turning about O , so O is the centre of oscillation of the body turning about the parallel axis passing through S ; in other words, the centres of oscillation and suspension are

convertible. For it has been shown (45) that $GS = \frac{h^2}{k}$ = $\frac{h^2}{OG}$; therefore $OG = \frac{h^2}{GS}$, that is to say, if the body

oscillates about the axis passing through S , then O is the centre of oscillation. This curious property, which was first demonstrated by Huygens in his *Horologium Oscillatorium*, was ingeniously applied by Captain Kater as a practical means of determining the length of the seconds pendulum. Two axes being assumed in a bar or rod of metal, the bar is adjusted by filing away one of its ends until the oscillations about each axis are performed exactly in the same time; and when this equality has been established, the distance between the axes is the length of the synchronous simple pendulum. See PENDULUM.

47. We shall now determine the centre of oscillation in a few particular cases.

Fig. 9.

Rotation.
Computation of centres of oscillation.

If the body is a heavy straight line suspended by one extremity, the OS = $\frac{2}{3}$ of its length; for making a = the length of the rod, we have (18) $\int r^2 dm = \frac{1}{3} a^3$, and in this case the mass $M = a$, and the centre of gravity is at the middle of the line, or $k = \frac{1}{2} a$, whence $Mk = \frac{1}{2} a^2$, and OS = $\frac{\int r^2 dm}{Mk} = \frac{\frac{1}{3} a^3}{\frac{1}{2} a^2} = \frac{2}{3} a$.

This is nearly the case of a slender rod of a cylindrical or prismatic shape, and it would be accurately so if all the points of a transverse section were equally distant from the axis of suspension.

If the oscillating body is an isosceles triangle suspended by its apex, and vibrating perpendicularly to its plane, O = $\frac{2}{3}$ of its height. For let a = the height, na = the base, z = a section parallel to the base, then $y = na$, $r = x$, and $dm = y dx$; whence $\int r^2 dm = n \int x^3 dx = \frac{1}{4} n a^4$ (when $x = a$). But in this case $M = \text{area} = \frac{1}{2} a \times na = \frac{1}{2} n a^2$; and the distance of the centre of gravity from the vertex being two thirds of the height, we have $k = \frac{2}{3} a$, whence $Mk = \frac{1}{2} n a^3$, and consequently OS = $\frac{\int r^2 dm}{Mk} = \frac{\frac{1}{4} n a^4}{\frac{1}{2} n a^3} = \frac{2}{3} a$.

48. The problem to find the centre of oscillation of a sphere suspended by a thread or an inflexible rod, is important on account of its application to the measurement of the seconds pendulum. Let us first suppose that the weight of the thread is insensible in comparison of that of the ball. Let r = radius of ball, l = length of thread from the point of suspension to the ball, and $a = l + r$ = distance from the point of suspension to the centre of the ball. The moment of inertia of the sphere in respect of an axis passing through its centre (18) is $\frac{2}{5} M r^2$; therefore (17) the moment in respect of a parallel axis at the distance a is $M(a^2 + \frac{2}{5} r^2)$; and on dividing this by $Mk (= Ma)$, we get the distance from the point of suspension to the centre of oscillation = $a + \frac{2r^2}{5a}$, or the centre of oscillation is below the centre of gravity by the distance $\frac{2r^2}{5a} \div a$.

49. Let us now suppose the weight of the thread or rod to be taken into account. Let C (fig. 10) be the centre of the ball, G the centre of gravity of the ball and rod OA, S the centre of oscillation; also let b = weight of ball, and b' = weight of rod. The moment of the sphere, oscillating about O, supposing the weight of the rod insensible, is found above = $M(a^2 + \frac{2}{5} r^2)$; and (18) the moment of the rod alone is $\frac{1}{2} O A^3 = \frac{1}{2} l^3 = \frac{1}{2} M' l^2$ (putting M' = mass of the rod); therefore, substituting the weights for the masses, that is, making $M = b$, and $M' = b'$, the moment of the compound body is $b(a^2 + \frac{2}{5} r^2) + \frac{1}{2} b' l^2$. Now, to find the position of G the centre of gravity, we have this theorem in statics, that the product of the whole mass multiplied into the distance of its centre of gravity from the axis, is equal to the sum of the products of the masses of the several parts into the respective distances of their centres of gravity; that is, putting OG = k , we have $(M + M')k = ba + \frac{1}{2} b' l$, and consequently (45),

$$OS = \frac{b(a^2 + \frac{2}{5} r^2) + \frac{1}{2} b' l^2}{ba + \frac{1}{2} b' l}.$$

Rotation on inclined planes.

50. Hitherto we have supposed the axes of rotation to be absolutely fixed; but the rotation may be performed about axes which are themselves in motion, as in the case of a ball or cylinder rolling down an inclined plane. When a ball rolls down an inclined plane, the point of the ball which rests on the plane is hindered from sliding down by friction; and therefore the ball tumbles, as it were, over this point of contact, and is instantly caught by another point of contact, over which it tumbles in the same manner. A cylinder rolls down in the very same way; and its motion is nearly the same as if a fine thread had been lapped round it, and one end of it made fast at the head of the

inclined plane. The cylinder rolls down by unwinding this thread.

The mechanism of all such motions (and some of them are important) may be understood by considering them as follows: Let a body of any shape be connected with a cylinder HOK (fig. 11), whose axis passes through G, the centre of gravity of the body. Suppose the body suspended from a fixed point A by a thread wound round the cylinder. The body will descend by the action of gravity, and it will also turn round, unwinding the thread. Draw the horizontal line SGO; this will pass through the point of contact O of the thread and cylinder, and O is the point round which the cylinder begins to turn in descending. Let S be its centre of oscillation corresponding to the momentary centre of rotation O. The body will begin to descend in the same manner as if all its matter were collected in S; for it may be considered, in this instant, as a pendulum suspended at O. But in this case S will descend in the same manner as if the body were falling freely. Therefore the velocity of G (that is, the velocity of descent) will be to the velocity with which a heavy body would fall as OG to OS.

Fig. 11.

Now since the points O, G, S, are always in a horizontal line, and the radius OG is given, as also OS (48), the velocity of a body falling freely, and of the body unwinding from this thread, will always be in the same proportion of OS to OG, and so will the spaces described in any given time. And thus we can compare their motions in every case when we know the place of the centre of oscillation.

It follows from this that the weight of the descending body will be to the tension of the thread as OS to GS; for the tension of the thread is the difference between the moment of the rolling body and that of the body falling freely. It is to be remarked, that this proportion between the weight of the body and the tension of the thread will be always the same; for it has been demonstrated (46), that if O be in the circumference of a circle whose centre is G, S will be in the circumference of another circle round the same centre, and therefore the ratio of OG to OS is constant.

If a circular body HOK roll down an inclined plane by unfolding a thread, or by friction which prevents all sliding, the space described will be to that which the body would describe freely as OG to OS; for the tendency down the inclined plane is a determined proportion of the weight of the body. The motion of rotation in these cases, both progressive and whirling, is uniformly accelerated.

51. In order to give an example of the application of the Inertia of preceding formulæ for the rotation of bodies about fixed machines. axes to the theory of machines actually performing work, we shall suppose the machine to be the wheel and axle, and that a weight W, attached to a chain passing over the cylinder, is to be raised by means of a power acting on another chain which passes over the wheel. Let the radius of the wheel = a , the radius of the cylinder = b , and suppose the moving power to be another weight P, or a mass of matter descending by the accelerating force of gravity.

Since the machine is in this case impelled by an accelerating force, the angular velocity ω is obtained from the equation (41), namely,

$$\frac{d\omega}{dt} = \frac{\text{moment of impelling force}}{\text{moment of inertia}}.$$

Now, because the weight P acts in a straight line whose distance from the axis = a , the moment of its force is Pa ; and in like manner the moment of the force exerted by W is Wb . But this last moment retards the motion, and must be taken as negative; therefore the moment of the impelling force is $Pa - Wb$. Again, the moment of inertia is made up of three parts: first, the moment of inertia of the

Rotation. machine, which depends on the quantity of dead matter contained in the wheel and cylinder, and which we may denote by K ; second, the moment of inertia of the weight P , which may be considered as attached to the extremity of the radius of the wheel; third, the moment of inertia of the weight W , which may be considered as attached to the extremity of the radius of the cylinder. Let M and M' be the masses of the bodies whose weights are P and W , then the moments of inertia are respectively Ma^2 and $M'b^2$. Let also g = the acceleration of gravity, then the weight of a body being the product of its mass into the force of gravity, we have $P = gM$, $W = gM'$, whence the whole moment of inertia is

$$K + \frac{Pa^2}{g} + \frac{Wb^2}{g},$$

and we have consequently

$$\frac{dw}{dt} = \frac{g(Pa - Wb)}{gK + Pa^2 + Wb^2}.$$

For the sake of abridging, let us assume

$$U = \frac{Pa - Wb}{gK + Pa^2 + Wb^2}, \text{ and the angular velocity will be}$$

given by the equation $w = g f U dt$. Also let v = the velocity of the *impelled point* of the machine, or the velocity with which P descends, and u = the velocity of the *working point*, or velocity with which W is raised; then $v = aw$, and $u = bw$, at the end of the time t ; and if we denote the respective accelerating forces by ϕ and ψ , we shall have

$$\phi = \frac{dv}{dt} = agU, \quad \psi = \frac{du}{dt} = bgU.$$

52. To find the proportion of the velocities of the impelled and working points which give the greatest performance when the weight and power are both given, we may treat the formula which expresses the work, that is, the accelerating force, or W , as a fluxionary quantity, and find its maximum. Thus, to find the radius of the wheel by which the weight will be raised with the greatest velocity, we have to differentiate the quantity denoted by U , on the supposition that a is variable, and make the result equal to zero. This will give an equation from which a will be obtained in terms of P , W , and b ; and it will be observed, that as K varies with a , the value of K in terms of a must be substituted in the value of U before the differentiation.

53. The friction may be taken account of by considering it as a quantity to be added to the weight W . Let f = the co-efficient of friction, and c = radius of the pivots supporting the machine, then the friction will be expressed by $fc(P + W)$, and we have only to substitute $Wb + fc(P + W)$ for Wb in the above expression for U .

54. In the case of the fixed pulley, the velocities of P and W are equal, and we have also $a = b$. If we denote the weight of the pulley by Q , then its mass will be $Q \div g$, and (18) its moment of inertia = $\frac{1}{2} Qa^2 \div g$; therefore the formula for the accelerating force with which P descends or W rises will be

$$\phi = g \cdot \frac{P - W}{\frac{1}{2} Q + P + W}.$$

Motion of a solid body entirely free. 55. We now proceed to consider the motion of a solid body which is entirely free.

When a solid body or rigid system is impressed at a single point by a force of which the direction does not pass through the centre of gravity, the body, if free to move in every direction, acquires two motions, one progressive, and equal to that which would have resulted if the direction of the force had passed through the centre of gravity, and the other rotatory, and equal to that which would have resulted if the body had been only at liberty to move round a fixed axis passing through the centre of gravity, and perpendicular to the plane which contains that centre, and the line of the direction of the impelling force.

56. In order to demonstrate this proposition, let HKL (fig. 12) be a section of the body passing through G the centre of gravity, and containing the line in which the force is directed; let P

Fig. 12.

be the point at which the given force F is applied, and PA its direction; through G draw GA perpendicular to PA , and let PA represent the intensity of the force F . Bisect AP in B , produce AG until $GC = AG$, and through C draw CD , CE perpendicular to AC , and make each equal to AB . If we now conceive a force represented by DC to be applied at D in the direction DC , and another force represented by EC to be applied at E in the direction EC , these two forces being equal, and acting in opposite directions, will destroy each other, or produce no movement in the body, and the motion which actually takes place in consequence of the application of the force PA at P , will be the same as would result from the application of the four forces PB , BA , DC , EC . Now it is evident, that if the two forces BA and DC acted alone, they would produce no rotatory motion about the axis passing through G , for their moments $BA \cdot AG$ and $DC \cdot CG$ are equal, and they tend to turn the body in opposite directions. But the same two forces both tend to give the body a progressive motion; and as the resultant of two equal and parallel forces is a force equal to their sum, and acting at the point which bisects the distance between their directions, the initial progressive motion of the body in consequence of the forces BA and DC will be the same as if the force $PA = F$ were applied at the point G in the direction parallel to PA . We have now to consider the two remaining forces PB and EC . As these two forces act on the line AC in opposite directions, their resultant is nothing, or their separate tendencies to produce a progressive motion in the centre of gravity of the body, are counteracted by their joint effort. But they conspire in tending to produce a rotatory motion in the same direction about the axis passing through G ; and the moment of the first in respect of that axis being $PB \cdot AG$, and that of the second $EC \cdot CG$, the sum of their moments is $(PB + EC) AG$ or $PA \cdot AG$. The whole effect of these two forces is therefore to produce the same initial angular velocity about the axis through G , perpendicular to HKL , as would be produced by the single force PA applied at the point A ; and it has been shown, that the whole effect of the forces BA and DC is to produce the same progressive movement of the centre of gravity as if the single force PA were applied at that point, consequently the proposition is demonstrated, and it appears that the two motions produced by the application of a force which is not directed towards the centre of gravity may be considered independently of each other.

57. Let V = the progressive velocity of the centre of gravity in the direction parallel to PA ; then the mass of the body being M , we have the force $F = MV$, and consequently $V = F \div M$. Again, if we make $AG = l$, the angular velocity produced by the force F applied at A is $w = F \cdot l \div \int r^2 dm$ (14), therefore $V : w :: \int r^2 dm : Ml$. Now, since $\int r^2 dm$ and M are both known from the nature of the body, it follows, that when the distance l is given, the ratio of the progressive motion of the centre of gravity to the velocity of angular rotation can be found; and, conversely, when the ratio of the two velocities is given, the distance l can be found. For example, let s be the space described by the centre of gravity while the body makes one revolution about its axis, then 2π is the space described, in consequence of the rotatory motion, by a point of the body whose distance from the axis = l , and the above proportion gives

$$l = \frac{2\pi \cdot \int r^2 dm}{s \cdot M}.$$

Rotation. 58. As it is not necessary that the progressive motion of the centre of gravity be in a straight line, this formula enables us to determine the distances from the centre at which the planets may have received the single impulses which gave them at the same time their motions of revolution in their orbits, and of rotation round their axes. Thus, taking the case of the earth, and making R = the radius of its orbit, the circumference of the orbit is $2\pi R$, and the part of this which is described by the centre of gravity, while the earth revolves once about its axis, is $\frac{2\pi R}{365} = s$; and by (18)

$$fr^2 dm \div M = \frac{2}{3} r^2; \text{ therefore } l = \frac{365 \times 2r^2}{5R}. \text{ If we assume}$$

$r = 4000$ miles, and $R = 95,000,000$ miles, this formula gives $l = 24\frac{1}{2}$ miles nearly.

Centre of spontaneous rotation.

59. The direction of the force being PA (fig. 12), if a point be taken in the line AG between A and G , the motion of the point arising from the rotation of the body about the axis is in the first instant of time parallel to the direction of the progressive motion, and if r be its distance from G , the velocity due to both motions will be $V + rw$. But if the point be taken on the other side of G , the direction of the rotatory motion will be opposite to that of the progressive motion, and the velocity of the point will be $V - rw$. If therefore the point T be taken such that making $GT = r$, we have the equation $V = rw$; then, for a single instant, every point in the straight line passing through T perpendicular to HKL is at rest, or is carried as far back by the rotatory motion in the first instant of time, as it is carried forward by the progressive motion; and, for a single instant, the double motion of the body may be regarded as a simple rotatory motion about that straight line. This point T is called the *centre of spontaneous rotation*, and the straight line passing through T , perpendicular to the plane HKL , is called the *axis of spontaneous rotation*.

Progressive motion of centre of gravity.

60. The preceding formulæ enable us to determine completely the two motions of translation and rotation when a force is applied to a single point of the free body; we have now to determine what the effect will be when any number of forces given in magnitude and direction are applied to different points of the body; and as it appears from what precedes, that during the first instant the two motions take place independently of each other, we shall first give the equations which fix the position of the centre of gravity of the moving body, and then those which define the rotatory motion, or determine the position of any point of the body with reference to its centre of gravity.

Let G be the centre of gravity of the body, M its mass, and let the motion be referred to three rectangular axes OX, OY, OZ . Let us now suppose forces given in magnitude and direction to be applied at the points $A, A', A'', \&c.$ of the body, and that each of them is resolved into three others respectively parallel to the directions of the axis, and let p, q, r , be the resolved forces applied at A ; p', q', r' , the resolved forces applied at A' , and so on; also let $P = p + p' + p'' + \&c.$, $Q = q + q' + q'' + \&c.$, $R = r + r' + r'' + \&c.$; then, since the moving force is equal to the product of the mass into the velocity, and since by (56) the progressive motion resulting from the force applied at A is the same as if it had been applied to the centre of gravity, the velocity of the centre of gravity from the joint action of all the forces, in the directions OX, OY, OZ , will be respectively

$$\frac{P}{M}, \frac{Q}{M}, \frac{R}{M}. \text{ But the resulting velocity is the diagonal of the parallelepiped of which these component velocities are the sides; therefore, denoting it by } V, \text{ we have}$$

$$V = \frac{1}{M} \sqrt{(P^2 + Q^2 + R^2)}.$$

To determine the direction of this velocity, let α, β, γ , be

the angles which its direction makes with the axis x, y, z ; then, since the forces P, Q, R meet in a point (the centre of gravity), we have

$$\cos. \alpha = \frac{P}{MV}, \cos. \beta = \frac{Q}{MV}, \cos. \gamma = \frac{R}{MV}.$$

These equations give the direction of the velocity; hence, since V has already been found, the initial velocity of the centre of gravity and its direction are both completely determined.

61. When the forces applied to the body are simply percussions, which cease to act after the first impact, and there is no resistance, no change will take place in the velocity or its direction during the second and succeeding instants, and the centre of gravity will describe a straight line with a uniform motion; but if the forces continue to act after the motion has commenced, we must have recourse to the formulæ given by the principles of dynamics, which express the varied motion of a body subjected to the action of accelerating forces. At the end of the time t , reckoned from the commencement of the motion, let x, y, z be the co-ordinates of the element of the body dm , referred to the rectangular axes OX, OY, OZ ; then the velocity at that instant being expressed by the differential of the space described divided by the element of the time, the components

of the velocity at the same instant will be $\frac{dx}{dt}, \frac{dy}{dt}, \frac{dz}{dt}$. Now

the forces acting on the body, whatever be their nature, may always be decomposed into others parallel to the three axes; suppose therefore P, Q, R to be the components of the accelerating forces in those directions acting on the point dm , then the increment of velocity being equal to the force into the element of the time, if the particle dm

were entirely free, the velocities $\frac{dx}{dt}, \frac{dy}{dt}, \frac{dz}{dt}$ would acquire

the increments Pdt, Qdt, Rdt in the instant dt . But the increments of velocity actually acquired in the instant dt

are the differentials of the velocities, or $d \cdot \frac{dx}{dt}, d \cdot \frac{dy}{dt}, d \cdot \frac{dz}{dt}$,

and therefore the velocities lost in consequence of the mutual connection of the particles are respectively

$$Pdt - d \cdot \frac{dx}{dt}, Qdt - d \cdot \frac{dy}{dt}, Rdt - d \cdot \frac{dz}{dt}.$$

Multiplying each of these expressions by dm , we get the quantities of motion due to the respective velocities. Now, according to a well-known principle of dynamics, the discovery of which is due to D'Alembert, the infinitely small quantities of motion lost in every instant by all the particles in consequence of their mutual connection must make equilibrium; the integrals of the preceding expressions multiplied by dm must therefore be severally equal to zero, and we have accordingly (on effecting the operations indicated, and dividing by dt) the three equations

$$\int P dm = \int \frac{d^2 x}{dt^2} dm, \int Q dm = \int \frac{d^2 y}{dt^2} dm, \int R dm = \int \frac{d^2 z}{dt^2} dm.$$

62. In order to find the place of the centre of gravity at the end of the time t , let its co-ordinates at that instant be x_1, y_1, z_1 ; then from the property of the centre of gravity we have

$$Mx_1 = \int x dm, My_1 = \int y dm, Mz_1 = \int z dm.$$

Regarding the variables as functions of the time t , differentiating twice, and dividing each time by dt , we obtain

$$M \frac{d^2 x_1}{dt^2} = \int \frac{d^2 x}{dt^2} dm, M \frac{d^2 y_1}{dt^2} = \int \frac{d^2 y}{dt^2} dm,$$

$$M \frac{d^2 z_1}{dt^2} = \int \frac{d^2 z}{dt^2} dm.$$

Rotation. Comparing these with the above equations, we have

$$M \frac{d^2x_1}{dt^2} = fPdm, \quad M \frac{d^2y_1}{dt^2} = fQdm, \quad M \frac{d^2z_1}{dt^2} = fRdm.$$

Now, the first members of these equations denote respectively the quantities of motion in the direction of the axes x, y, z , of a material point whose mass = M , and the integrals $\int Pdm, \int Qdm, \int Rdm$ denote the quantities of motion of the body or rigid system under consideration, subjected to the accelerating forces P, Q, R ; it follows, therefore, that during the whole continuance of the motion the centre of gravity moves as if the whole of the matter of the body were concentrated there, and the forces which act on the body were all applied at that point.

63. Having thus given the equations which enable us to determine the motion of the centre of gravity of a free system under the action of given forces, we now proceed to consider the rotatory movement of the system, and to investigate the position of any point of it with respect to the centre of gravity at the end of any given interval of time. The investigation of this problem is greatly facilitated by means of the following elegant theorem respecting the composition of rotatory motion, discovered by Frisi.

Composi-
tion of ro-
tatory mo-
tion.

PROPOSITION. If a solid body revolve round an axis OA (fig. 13) passing through its centre of gravity with an angular velocity = w , and if a force be impressed upon it which alone would cause it to revolve about an axis OB also passing through its centre of gravity with an angular velocity = w' , then the body will not revolve about either OA or OB , but about a third axis OC lying in the plane of the other two, and inclined to each of the former axes in angles whose sines are inversely as the angular velocities round those axes, or so that $\sin. AOC : \sin. BOC :: w' : w$; and the angular velocity u round the new axis is to that round one of the primitive axes as the sine of inclination of the two primitive axes is to the sine of the inclination of the new axis to the other primitive axis, that is, $u : w :: \sin. AOB : \sin. COB$, or $u : w' :: \sin. AOB : \sin. AOC$.

64. In order to prove this proposition, it is necessary to show, 1st, that any point in the line OC is at rest while the two motions are taking place; 2d, that every particle of the body not situated in AC revolves about the axis AC ; and 3d, to assign the velocity of rotation.

(1.) Let the angular motion about the axis OA be supposed to be in the direction by which every point in the angle AOB would be raised above the plane of the paper, and that about OB to be in the direction by which every point within the same angle would be depressed below the plane of the paper, and take any point E in OC , and draw EH and EK respectively perpendicular to OA and OB . The absolute velocity with which the point E moves in consequence of the rotation about OA is $HE \cdot w$, and the absolute velocity with which it moves about OB is $KE \cdot w'$. But $HF = OE \sin. AOC$, and $KE = OE \sin. BOC$; and by hypothesis $w' : w :: \sin. AOC : \sin. BOC$, whence $w' \sin. BOC = w \sin. AOC$, therefore the two velocities $HE \cdot w$ and $KE \cdot w'$ are equal; and they are in opposite directions, consequently the point E remains at rest. In the same manner, it is shown that every other point in OC remains at rest.

(2.) Let P be the place of any particle of the body, and conceive the surface of a sphere to pass through P , intersecting the axes in A and B , and join PA and PB by arcs of great circles. Draw PM perpendicular to AP , and make $PM = w \cdot \sin. AP$ = absolute velocity of the particle P about the axis OA in $1''$ of time; also draw PN perpendicular to BP , and make $PN = w' \cdot \sin. BP$ = absolute velo-

Fig. 13.

city of P about OB in $1''$ (the radius being unity), and complete the parallelogram $PMRN$.

Rotation.

Since the particle dm , in virtue of the rotation about OA , has a motion which would cause it to describe the line PM in a second, and in virtue of the rotation about OB has also a motion which would cause it to describe PN in a second, the particle will describe PR the diagonal of the parallelogram $PMRN$. Through P let an arc of a great circle be described perpendicular to PR , and produced to meet the plane AOB in the point C , which at present we suppose indeterminate, and join OC ; then OC is the straight line in which a plane passing through P , perpendicular to PR , intersects the plane AOB .

Because APM and CPR are equal, being right angles, take from each the common angle APR , and there remains $RPM = APC$; and because BP and CPR are right angles, add to each NPC , and we have $RPN = BPC$. Now $PM = w \sin. AP$, and $PN = RM = w' \sin. BP$, therefore

$$PM : RM :: w \sin. AP : w' \sin. BP;$$

$$\text{but } PM : RM :: \sin. MRP (= \sin. RPN) : \sin. RPM,$$

$$\text{or } PM : RM :: \sin. BPC : \sin. APC;$$

therefore $\sin. BPC : \sin. APC :: w \sin. AP : w' \sin. BP$, whence $w' \sin. BP \cdot \sin. BPC = w \sin. AP \cdot \sin. APC$.

Now in the spherical triangles BPC and APC we have $\sin. BP \cdot \sin. BPC = \sin. CB \cdot \sin. PCB$, and $\sin. AP \cdot \sin. APC = \sin. AC \cdot \sin. ACP$; therefore

$$w' \sin. CB \cdot \sin. PCB = w \sin. AC \cdot \sin. ACP.$$

But $\sin. PCB = \sin. ACP$ (the one angle being the supplement of the other); also $\sin. CB = \sin. BOC$, $\sin. AC = \sin. AOC$, therefore $w' \sin. BOC = w \sin. AOC$, and consequently

$$w : w' :: \sin. BOC : \sin. AOC.$$

From this it follows that OC divides the angle AOB into parts having a given ratio, and is therefore given in position; and as it may be shown in like manner that the plane passing through every other particle of the body perpendicular to the direction of the motion of that point intersects the plane AOB in OC , OC is therefore the axis of rotation.

(3.) To find u , the angular velocity about OC . In the triangle RPM we have $RP : PM :: \sin. RMP : \sin. MRP$; but $\sin. RMP = \sin. MPN = \sin. APB$, and $\sin. MRP = \sin. RPN = \sin. CPB$, therefore $RP : PM :: \sin. APB : \sin. CPD$. Now $RP = u \sin. CP$ = absolute velocity about OC in $1''$, and $PM = w \sin. AP$ = absolute velocity about OA in $1''$. Substituting these expressions therefore in the last proportion, and multiplying extremes and means, we get

$$u \sin. CP \cdot \sin. CPB = w \sin. AP \cdot \sin. APB.$$

But the spherical triangles CPB and APB give $\sin. CP \sin. CPB = \sin. CB \sin. CBP$, and $\sin. AP \sin. APB = \sin. AB \sin. ABP$. Therefore, substituting, and leaving out the common term, we have $u \sin. CB = w \sin. AB$, or $u \sin. COB = w \sin. AOB$, that is,

$$u : w :: \sin. AOB : \sin. COB.$$

In like manner, it may be shown that

$$u : w' :: \sin. AOB : \sin. AOC,$$

whence the proposition is demonstrated.

65. When the two primitive axes OA and OB are at right angles, $\sin. AOB = 1$, $\sin. COB = \cos. AOC$, and the above two proportions give $u : w :: 1 : \cos. AOC$, $u : w' :: 1 : \sin. AOC$, whence $u \cos. AOC = w$, and $u \sin. AOC = w'$, and consequently $u^2 = w^2 + w'^2$, or $u = \sqrt{(w^2 + w'^2)}$.

66. Suppose a third axis OD at right angles to OA and OB , and that a force is impressed on the body, which alone would cause it to revolve about OD with an angular velocity = w'' ; then, as the body is revolving about OC with the velocity u , the effect of this new force will be to cause it to revolve about an axis in the plane DOC ; and if we make ψ = the angle which this new axis makes with the line OC , and W = the velocity about the new axis, we

Rotation. shall have from the preceding formulæ $W \cos. \psi = u$, and $W \sin. \psi = w'$, whence $W = \sqrt{(u^2 + w'^2)}$, or, substituting for u its value found above, $W = \sqrt{(w^2 + w'^2 + w''^2)}$. The position of the new axis is, however, more conveniently defined by the angles which it makes with the three primitive axes. Let α, β, γ be the angles which it makes respectively with the primitive axes OA, OB, OD, then the three spherical triangles which it forms with the three axes give $\cos. \alpha = \cos. AOC \cos. \psi$, $\cos. \beta = \cos. BOC \cos. \psi$, $\cos. \gamma = \sin. \psi$. Now, from the preceding equations (65), we have $\cos. AOC = \frac{w}{u}$, $\cos. BOC = \sin. AOC = \frac{w'}{u}$, $\cos. \psi = \frac{u}{W}$, $\sin. \psi = \frac{w''}{W}$. Therefore, substituting and writing for W its value $\sqrt{(w^2 + w'^2 + w''^2)}$, we obtain

$$\cos. \alpha = \frac{w}{\sqrt{(w^2 + w'^2 + w''^2)}}, \cos. \beta = \frac{w'}{\sqrt{(w^2 + w'^2 + w''^2)}}, \cos. \gamma = \frac{w''}{\sqrt{(w^2 + w'^2 + w''^2)}}.$$

Hence it follows that the change of position of any point in consequence of the rotation Wdt , in the element of time dt , is equivalent to the change that would be effected by three simultaneous and independent rotations $Wdt \cos. \alpha$, $Wdt \cos. \beta$, $Wdt \cos. \gamma$, about three rectangular axes, with which the axis corresponding to the velocity W makes respectively the angles α, β, γ .

67. In determining the rotation of a body about a fixed centre, it is most convenient to refer every point of the body to a system of three principal axes passing through the centre of gravity; there are therefore two distinct steps in the investigation, the first being to find the situation of the principal axes in respect of absolute space at the end of any given time, and the second to find the position of any point of the body referred to these axes, whose positions have been determined. To accomplish the first of these, the following proposition is required.

68. If at the end of any time t the position of the axis about which the body is revolving be known in respect of the three principal axes supposed to be fixed in the system, together with the angular velocity of rotation; to determine the change of situation of the principal axes in respect of absolute space, in the element of time dt .

Imagine a sphere, whose radius = 1, to be described about O the centre of gravity of the body; let KTL (fig. 14) be a great circle, and in KTL assume a point T as that to which the position of the principal axes is to be referred. At the end of the time t , let X, Y, Z be the points in which the three principal axes passing through O meet the surface of the sphere; then, on joining these points by arcs of great circles, the three arcs XY, YZ, ZX will be quadrantal arcs, since the principal axes are at right angles to each other. Join also X, Y, Z with T by arcs of great circles, and assume

$$TX = l, TY = m, TZ = n, KTX = \lambda, KTY = \mu, KTZ = \nu.$$

Let U be the point in which the axis about which the body is revolving at the end of the time t meets the surface of the sphere, and let U be joined by arcs of great circles with X, Y, Z. Put W = angular velocity of rotation about OU (which we suppose to be in the direction XYZ), and let α, β, γ be the angles which OU makes with the principal axes, namely, $\alpha = UX, \beta = UY, \gamma = UZ$.

To investigate the motion of the point X, let Xe be the small arc described by X in the instant dt ; then this arc

being perpendicular to UX, we have the angle YXe = UXZ, and $\sin. YXe = \cos. YXU$; also, since YXZ is a right angle, $\sin. TXY = \cos. TXZ$. Hence the formulæ of spherical trigonometry give the following equations,

$$\sin. YXe = \frac{\cos. \beta}{\sin. \alpha}, \cos. YXe = \frac{\cos. \gamma}{\sin. \alpha},$$

$$\cos. TXY = \frac{\cos. m}{\sin. l}, \sin. TXY = \frac{\cos. n}{\sin. l};$$

from which, since TXe = YXe - TXY, we deduce

$$\sin. TXe = \frac{\cos. \beta \cos. m + \cos. \gamma \cos. n}{\sin. \alpha \sin. l},$$

$$\cos. TXe = \frac{\cos. \gamma \cos. m - \cos. \beta \cos. n}{\sin. \alpha \sin. l}.$$

Draw ef perpendicular to TX; then, because Xe = Wdt sin. α , we have Xf = Wdt sin. α cos. TXe, ef = Wdt sin. α sin. TXe. But Xf = -dl, ef = -sin. $ld \lambda$; therefore, by reason of the above values of sin. TXe and cos. TXe, and because W cos. $\beta = w'$, W cos. $\gamma = w''$, we have

$$\sin. ldl = dt(w' \cos. n - w'' \cos. m), \sin.^2 l d\lambda = -dt(w' \cos. m + w'' \cos. n).$$

It is evident that the consideration of the motion of each of the other two points Y and Z will lead to expressions entirely similar, and which may be concluded from analogy: we have therefore the following six equations to determine $l, m, n, \lambda, \mu, \nu$, namely,

$$\begin{aligned} \sin. ldl &= dt(w' \cos. n - w'' \cos. m), \\ \sin. m dm &= dt(w'' \cos. l - w \cos. n), \\ \sin. n dn &= dt(w \cos. m - w' \cos. l), \\ \sin.^2 l d\lambda &= -dt(w' \cos. m + w'' \cos. n), \\ \sin.^2 m d\mu &= -dt(w'' \cos. n + w \cos. l), \\ \sin.^2 n d\nu &= -dt(w \cos. l + w' \cos. m). \end{aligned}$$

Because $\cos.^2 l + \cos.^2 m + \cos.^2 n = 1$, it is only necessary to solve two of the first three equations, in order to find the arcs l, m, n ; and when the values of l, m, n have been obtained, it is only necessary to compute one of the three angles λ, μ, ν , in order to have the other two; for when one is known, the others are obtained from the equations $\cos. (\mu - \lambda) = -\cot. l \cot. m$, $\cos. (\nu - \mu) = -\cot. m \cot. n$, given by the triangles TYX and TYZ, of which the sides XY and YZ are arcs of 90° .

69. By means of the preceding propositions, we are enabled to determine the motion of a body which is at liberty about a fixed point. The statical principle on which the determination must be made is, that a body so circumstanced will be in a state of equilibrium, when the sums of the moments of the forces with reference to three rectangular axes drawn through the fixed point are nothing relatively to each of the three axes. It is therefore necessary in the first place to find expressions for these moments.

70. Suppose a material point whose co-ordinates are x and y to be urged by two forces, namely, a force = X, in the direction OX (fig. 15), and another force = Y in the direction OY, perpendicular to OX; then the efficacy of the two forces to turn the particle about the axis OZ perpendicular to the plane XOY, in the direction from X towards Y, is equal to $Yx - Xy$. For let M be the situation of the particle, and take MN to represent the intensity and direction of the single force into which X and Y may be compounded; through M and N draw MA, NB perpendicular to OX and MC, ND perpendicular to OY; let E be the point in which MC and NB intersect; join OM, ON, OE, and complete the parallelogram OF. Now the force represented by MN is compounded of the two forces represented by ME and EN; we have therefore, by construction,

Fig. 14.

Fig. 15.

Rotation.

ME = -X = force in direction -OX,
 EN = +Y = force in direction OY.

But the moment of the force MN in respect of the axis OZ is equal to MN multiplied into the line drawn from O perpendicular to MN, that is, equal to twice the triangle OMN, or to twice the sum of the triangles MOE, EON, MEN, or to the parallelograms MB, NC, EF, or to MB and CF. Now MB = AM · ME = -Xy, and CF = CD · CM = Yx; therefore, the moment of the force MN, or of the two forces X and Y, is expressed by Yx - Xy.

71. If we put Z = a force acting in the direction OZ perpendicular to the plane XOY, we shall evidently obtain similar expressions for the moments in respect of the other axes OX and OY; so that if we suppose the motion about OX to be in the direction from Z towards Y, and that about OY to be from X towards Z, and that about OZ to be from Y towards X, we shall have the three expressions,

$$\begin{aligned}\text{moment about OX} &= Yz - Zy, \\ \text{about OY} &= Zx - Xz, \\ \text{about OZ} &= Xy - Yx.\end{aligned}$$

72. If we now suppose P, Q, R to be the accelerating forces acting on a particle dm , in the directions of the three axes respectively, then (61) the quantities of motion lost by the particle at each instant, in consequence of the connexion of the parts of the system, or the differences between the impressed and effective forces, are

$$dm \left(Pdt - \frac{ddx}{dt} \right), dm \left(Qdt - \frac{ddy}{dt} \right), dm \left(Rdt - \frac{ddz}{dt} \right).$$

Substituting these differences for X, Y, Z respectively in the above expressions (71) for the moments of rotation, and forming the integrals in respect of dm , we shall get the sums of the moments in respect of all the particles about each of the three axes. But by the principle of D'Alembert (61), these sums must be severally = 0; therefore, if for brevity we put

$$F = \int (Qz - Ry) dm, G = \int (Rx - Pz) dm, \\ H = \int (Py - Qx) dm,$$

there will result the three equations

$$\begin{aligned}Fdt &= \int yz dm \frac{ddx}{dt} - \int xz dm \frac{ddy}{dt} \\ Gdt &= \int xz dm \frac{ddx}{dt} - \int xz dm \frac{ddz}{dt}, \\ Hdt &= \int xz dm \frac{ddy}{dt} - \int yz dm \frac{ddz}{dt}.\end{aligned}$$

73. We have now to express these formulæ in terms of the angular velocities about the axes. Referring to fig. 14, let $x = \cos. l$, $y = \cos. m$, $z = \cos. n$, then x, y, z will be the co-ordinates of the point T referred to the rectangular axes OX, OY, OZ; and we shall have $dx = -\sin. l dl$, $dy = -\sin. m dm$, $dz = -\sin. n dn$. Substituting these values of x, y, z , and their differentials, in the three first of the system of equations in (68), and supposing the direction of the motion to be changed (namely, the rotation about OX to be in the direction from Z towards Y, and so with the other as in (71)), those three equations will become

$$\begin{aligned}dx &= dt (w'z - w''y), \\ dy &= dt (w''x - w'z), \\ dz &= dt (wy - w'x).\end{aligned} \quad (A)$$

If we now observe that OX, OY, OZ are principal axes, and consequently that $\int xy dm = 0$, $\int xz dm = 0$, $\int yz dm = 0$, we shall find, on forming the expressions for ddx, ddy , and substituting always for dx, dy, dz their values as given by these equations,

$$\int yz dm \frac{ddx}{dt} = \int y^2 dm \cdot dw + w'w'' \int y^2 dm \cdot dt,$$

$$\int xz dm \frac{ddy}{dt} = -\int z^2 dm \cdot dw + w'w'' \int z^2 dm \cdot dt,$$

and consequently

$$Fdt = \int (y^2 + z^2) dm \cdot dw + w'w'' \int (y^2 - z^2) dm \cdot dt.$$

Similar expressions are obtained in the same manner for Gdt and Hdt . Now it is to be observed that $\int (y^2 + z^2) dm$ is the moment of inertia with respect to the axis OX; if therefore we assume A, B, C to denote the moments of inertia in respect of the three axes respectively, that is, if we put

$A = \int (y^2 + z^2) dm$, $B = \int (x^2 + z^2) dm$, $C = \int (x^2 + y^2) dm$, the three equations of the last number will be transformed into the following:

$$\begin{aligned}Fdt &= Adw + (C - B) w'w'' dt, \\ Gdt &= Bdw' + (A - C) ww' dt, \\ Hdt &= Cdw'' + (B - A) ww' dt.\end{aligned} \quad (B)$$

74. These three equations enable us to determine the angular velocities of rotation about each of the principal axes when the forces F, G, H are known, and consequently suffice, when joined to the equations of (68) and the equations (A), for the determination of any point of the revolving body at any given instant of time reckoned from the commencement of the motion; for the values of w, w', w'' being supposed to be found in terms of t , and substituted in the two sets of equations of (68), the integrals of these equations will give the situation of the three principal axes at that instant, and the situation of the instantaneous axis of rotation, in respect of the principal axes, will be found by integrating the equations (A) after substituting in them the same values of w, w', w'' .

75. When the body is subject to no accelerating forces, or the origin of the co-ordinates is placed at the centre of gravity, the integrations indicated in the last paragraph are obtained without difficulty; for in this case the quantities denoted by F, G, H, respectively vanish, and the equations (B) become

$$\begin{aligned}0 &= Adw + (C - B) w'w'' dt, \\ 0 &= Bdw' + (A - C) ww' dt, \\ 0 &= Cdw'' + (B - A) ww' dt.\end{aligned} \quad (a)$$

Now if we multiply the first of these by w , the second by w' , and the third by w'' , and add the products, we shall have

$$0 = Awdw + Bw'dw' + Cw''dw'',$$

the integral of which is

$$K = Aw^2 + Bw'^2 + Cw''^2, \quad (b)$$

K being an arbitrary constant, and always positive. Again, let the same equations (a) be multiplied respectively by Aw, Bw', Cw'' , and the products added and integrated; we shall then have, in like manner,

$$L^2 = A^2w^2 + B^2w'^2 + C^2w''^2, \quad (c)$$

L^2 being another arbitrary constant, and always positive. From these two last equations we deduce

$$\begin{aligned}w^2 &= \frac{CK - L^2 + A(A - C)w^2}{B(C - B)}, \\ w'^2 &= \frac{L^2 - BK - A(A - B)w^2}{C(C - B)};\end{aligned}$$

and on substituting the values of w' and w'' thus found in the first of the equations (a), and resolving the equations in respect of dt , we get

$$dt = \frac{\pm \sqrt{(BC) \cdot Adw}}{\sqrt{\{CK - L^2 + A(A - C)w^2\} \cdot \{L^2 - BK - A(A - B)w^2\}}},$$

an equation of which the integral will be obtained in a finite form when any two of the three quantities A, B, C are equal (as in the case of a solid of revolution), or when L^2 is equal to any one of the three quantities AK, BK, CK. In any case, the relation between t and w is expressed by a single differential equation of the first order, the integral of which gives the value of w in terms of t , whence the values of w' and w'' are also given by the preceding formulæ.

76. From the two equations (b) and (c) of last para-Mechanical graph, a conclusion is deduced of considerable interest in properties of the physical theory of the universe respecting the stability of the rotation about the axes of greatest and least of rotation.

Rotation. moment. Let the first of those equations be multiplied by C, and subtracted from the second; we shall have, on making $L^2 - CK = D$,

$$D = A(A - C)w^2 + B(B - C)w'^2.$$

Now, if we suppose the axis of instantaneous rotation to be situated at the commencement of the motion, very near the axis OZ, the angular velocity about which $= w'$, then the angle γ which it makes with that axis being very small,

and since (66) $\sin. \gamma = \frac{\sqrt{(w^2 + w'^2)}}{\sqrt{(w^2 + w'^2 + w'^2)}}$, it follows that

the angular velocities w and w' will be very small in comparison of w' , and consequently D must be a very small quantity. Now D is constant; and therefore if the two differences $A - C$ and $B - C$ have the same sign, which will be the case when the value of B is intermediate between A and C, the two velocities w and w' must always be very small; and hence (64) the instantaneous axis will never deviate much from OZ when this is the axis of greatest or of least moment. But if $A - C$ and $B - C$ have opposite signs, as will be the case when the value of C lies between the values of A and B, then D may be a very small quantity, and the equation still be satisfied, although the values of w and w' be large; and hence, although the axis of instantaneous rotation may have been very near the axis C at the commencement of the motion, it may deviate to any extent from that axis during the motion. Hence we infer that the rotation about the axes, both of greatest and least moment, is permanent, but that the rotation about the intermediate axis is not permanent.

77. The same conclusions may also be obtained by the direct integration of the equations (a) of (75), if we neglect, as insensible, the squares and products of the small velocities w and w' . Restricting the calculus to this approximation, the third equation (a) becomes $dw'' = 0$, whence $w'' = h$, h being an assured arbitrary constant. Substituting this value of w'' in the first two equations (a) we get

$$\begin{aligned} 0 &= A dw + (C - B) h w' dt, \\ 0 &= B dw' + (A - C) h w dt. \end{aligned} \quad (d)$$

In order to integrate these, assume

$$w = \beta \sin. (qt + i), \quad w' = \gamma \cos. (qt + i), \quad (e)$$

the quantities β, γ, q, i being indeterminate constants. We have then

$$dw = q\beta \cos. (qt + i), \quad dw' = -q\gamma \sin. (qt + i).$$

On substituting these values of w, w', dw, dw' , and rejecting the common factors, the equations (d) become

$$\begin{aligned} 0 &= Aq\beta - (B - C)h\gamma, \\ 0 &= Bq\gamma - (A - C)h\beta, \end{aligned}$$

from which we deduce $q = h \sqrt{(A - C)(B - C)} \div \sqrt{AB}$; and also, on assuming another indeterminate constant α , $\beta = \alpha \sqrt{B(B - C)}, \gamma = \alpha \sqrt{A(A - C)}$. Put $\lambda = \sqrt{(A - C)(B - C)} \div \sqrt{AB}$, then $q = \lambda h$; and the substitution of these values of q, β, γ in the equations (e) gives

$$\begin{aligned} w &= \alpha \sqrt{B(B - C)} \sin. (\lambda ht + i), \\ w' &= \alpha \sqrt{A(A - C)} \cos. (\lambda ht + i), \end{aligned}$$

which are the complete integrals of the equations (d).

If in these expressions the quantity denoted by λ is real, which will be the case when C is the least or the greatest of the three moments, the values of w and w' must always continue small, because they are proportional to the sines and cosines of a real angle; but if C be intermediate between A and B, the λ will be an impossible quantity, and the sine and cosine of the arc $\lambda ht + i$ will be changed into exponentials which increase continually with the time t , whence the velocities w and w' will also increase indefinitely; and consequently, by Frisi's theorem, the deviation of the instantaneous axis of rotation from the original axis will increase indefinitely.

If we suppose that at the commencement of the motion

the axis of instantaneous rotation coincided accurately with the principal axis OZ, we should have $w = 0, w' = 0$, when $t = 0$; and as in this case we have also $\alpha = 0, w$ and w' will always be zero, or the body will continue for ever to revolve uniformly about OZ. We have therefore, from what precedes, these mechanical properties relative to the rotation of solid bodies: 1. If a body begins to revolve about any one of the three principal axes, and is affected by no external force, it will continue always to revolve about that axis; 2. If it begins to revolve about an axis which is very near the axis of the greatest or least moment, then, although the motion is disturbed a little by the action of an extraneous force, the instantaneous axis of rotation will continue very near the original axis; 3. If the rotation commences about the axis of the mean moment of inertia, then, if the smallest disturbance takes place, the effect will increase indefinitely with the time, and the poles of rotation will entirely change their position on the surface of the body. These properties establish an essential difference between the three principal axes.

78. Our limits will not permit us to enter further into the discussion of this subject, nor is it within the scope of the present article to apply the formulæ to the rotation of the planets, an example of which application has already been given in the article PRECESSION OF THE EQUINOXES. It has now been shown that every circumstance relative to the motion of a solid body, acted upon by any number of forces, is expressed by means of two systems of equations (each containing three differential equations of the first order), the first system (62) defining the motion in space of the centre of gravity, and the second (73) the rotation about that centre. At the commencement of the motion these two systems are independent of each other; but it is important to remark, that this independence does not necessarily continue during the motion. If we suppose the moving forces to act upon different points of the body, and to be functions of the co-ordinates of those points, that is, to vary with their distance from the origin, then the co-ordinates enter at the same time into both systems of equations, which therefore cannot be integrated separately, the two motions affecting each other. The integrals can then only be obtained by approximation. There are, however, two important cases in which the two motions continue to be permanently independent of each other. The first is that of a projectile which, during its motion, is acted upon by no other force than gravity; for in this case the equations (62) will be those of an isolated material point, and the weight of the body, acting as a single force applied to the centre of gravity, will have no influence on the rotation, which will be the same as if the centre of gravity were fixed. The second is the case of a sphere, either homogeneous or composed of concentric strata of different densities, the density of each stratum being constant; for in this case the resultant of all the attractive forces, as was shown by Newton, passes through the centre of gravity, which will therefore move as an isolated point, and the motion of rotation will be the same as if the centre of gravity were fixed.

The theory of the rotation of solid bodies forming an important branch of mechanics, is treated more or less in every systematic work on that science. As the more important works in which it is especially considered, we may refer the reader to Euler's *Theoria Motus Corporum Solidorum*, 1765; D'Alembert, *Opuscula*, tom. v. and vii.; Vince *On the Principles of Progressive and Rotatory Motion*, Phil. Trans. 1780; Frisi's *Opera*, tom. ii. 1783; Atwood's *Treatise on the Rectilinear Motion and Rotation of Bodies*, 1784; Landen's *Mathematical Memoirs*, vol. ii. 1789; Laplace, *Mécanique Céleste*, tom. i.; Lagrange, *Mécanique Analytique*; Poisson, *Traité de Mécanique*; Venturoli's *Mechanics*, translated by Cresswell; and the article MECHANICS. (T. G.)

Rotation.

Rothen-
burg
||
Rothesay.

ROTHENBURG, a town of Bavaria, in the circle of Middle Franconia, in a beautiful situation on the ridge of a hill on the Tauber, 29 miles S.S.E. of Wurzburg. It is encircled with a turreted wall and a moat, and contains in the market-place a fine old town-hall in various architectural styles. The principal church of St James is an old and fine specimen of pure pointed Gothic, containing some interesting works of art. The town is supplied with water by a forcing-pump, which raises it from the river to the summit of a tower. Weaving is carried on here, and there are many vineyards in the vicinity. Rothenburg is a place of great antiquity, and it was one of the head-quarters of the insurgents in the Peasants' War of 1525. Pop. 5650.

ROTHERHAM, a market-town of England, in the West Riding of Yorkshire, on a rising ground on the right bank of the Don, 48 miles S. by W. of York, and 159 N.N.W. of London. Many of the streets are steep and irregular, lined with houses of a mean appearance, although the recently-built portion of the town exhibits quite an opposite aspect. The parish church was built by Archbishop Rotherham in the fifteenth century, and is considered to be one of the finest buildings of its class in the north of England. It is cruciform, in the perpendicular style, and has a richly-carved tower and spire rising from the centre. Wesleyan and Primitive Methodists, Independents, Baptists, Roman Catholics, and Unitarians have also places of worship in the town. The educational establishments include an Independent theological college, containing thirteen students in 1854; a grammar school, with forty pupils; national schools, &c. There are a library and news-room, a literary institution, and a dispensary. In the vicinity great quantities of coal and iron-ore are obtained, and thus facilitate the conducting of manufacturing operations. There is a large factory for cast-iron, a brass foundry, and manufactories of starch, soap, naphtha, glass, and other articles. There are ship-building yards on the Don, where vessels as large as 50 tons burden are constructed. The most of the manufactures are carried on at Masborough, a suburb on the other side of the river, connected with Rotherham by a bridge of five arches. Markets are held here twice a week, and fairs for horses and cattle three times a year. Rotherham is a place of considerable antiquity. The Roman station *Ad Fines* probably stood about a mile off; and the town seems to have been founded by the Saxons. Even before the Norman conquest it had attained some importance, possessing a corn-mill and being the seat of a market and fair. A college was founded here in 1482 by Archbishop Rotherham, but suppressed in the reign of Edward VI. Pop. (1851) 6325.

ROTHESAY, a royal burgh of Scotland, capital of the county of Bute, stands at the head of a deep bay in the island of Bute, near the entrance of the strait called the Kyles of Bute, between that island and Argyllshire, 52 miles W. of Glasgow. A range of elegant villas stretches along the shore for some distance from E. to W., and in the centre the town extends somewhat farther to the south, and has several transverse streets. Near the centre of the town stands the ruins of the old royal castle of Rothesay, burned by a brother of the Duke of Argyll in the year 1685. One of the chief edifices in Rothesay is that which contains the town-hall and county buildings, a castellated structure with a handsome tower. Besides this, the only buildings deserving notice are the churches, of which there are two, one a chapel of ease, belonging to the Established Church; three, two of which have elegant spires, to the Free Church; one each to the United Presbyterians, Reformed Presbyterians, Baptists, and Episcopalians. Abundant means of education are supplied by several schools; and there are a news-room and more than one library. The town contains

cotton factories, power-loom factories, boat-building yards, Rothschild and cooperages. But the principal occupation of the inhabitants is fishing, especially for herring, but also in a less degree for salmon, haddocks, whittings, and soles. The harbour has a good stone pier, which is used by the steamers that ply from Glasgow to Inverary and the West Highlands. The burgh is governed by a provost and seventeen councillors; it formerly joined with some others in electing a member of Parliament, but was disfranchised by the Reform Act of 1832. Rothesay and the neighbouring village of Port Bannatyne are much frequented during the summer as watering-places. The climate is very mild, as the bay is almost land-locked. Rothesay Castle is supposed to have been founded about the end of the eleventh century. It was besieged in 1263 by Heulbec, King of the Isles, taken by the English in the reign of Baliol, and by the Scotch under Bruce in 1311. Robert II. built a palace here; and Robert III. granted a charter to the burgh in 1400. The former monarch created his eldest son Duke of Rothesay, a title still borne by the Prince of Wales. Pop. (1851) 7014. (See ВУТЕШЕЙ.)

ROTHSCHILD, the name of the greatest commercial house either in ancient or in modern times. The founder of the firm, *Mayer Anselm Rothschild*, was born at Frankfort-on-the-Maine in 1743. The destiny of his early days was anything but propitious. His parents were poor, and of the despised Jewish race. They died when he was no older than eleven. After receiving a scanty education, he was set adrift in the world. The best position that he could for some time attain was a menial office in the employment of an Israelitish trader. But the commercial genius of Rothschild soon worked its own way. His mind took to the congenial study of the coins of different nations. He grew thoroughly versed in the relative value of the various monies. A banker of Hanover became impressed with his aptitude for business, and gave him a place in his office. There he succeeded so well that in 1780 he set up a bank in his native city. Rothschild now began to rise in his profession. His shrewdness, punctuality, and uprightness soon came to be remarked. Many matters of importance were entrusted to his care. In particular, William, Landgrave (afterwards Elector) of Hesse, made him his banker. In that office he won general esteem by the able way in which he saved his patron's funds during the invasion of the French. Thus he laid the foundations of a great firm; and at his death in 1812 left to his sons a large fortune and a European fame. Of Rothschild's five sons, Anselm settled at Frankfort, Salomon at Vienna, Nathan Mayer at London, Charles at Naples, and James at Paris.

Nathan Mayer Rothschild, who was born in 1777, was the great continuer of the family reputation. About the time of his father's death he was fast extending the influence of the firm. The several branches of the house throughout Europe gave him a broad and secure basis for his operations. On this foundation his shrewd tact and prompt management erected a stupendous business. The whole Continent became pervaded with his financial transactions. Among other enterprises, he supplied with loans that great coalition of powers which overthrew Bonaparte. For such services Nathan Rothschild might have been rewarded with several honours and dignities; but he was modest, and till his death, in 1836, he remained content with the untitled name and honourable position of a merchant prince. His eldest son, Lionel Nathan, Baron de Rothschild, is at present one of the representatives for the city of London.

ROTTECK, KARL WENCESLAUS RODECKER VON, a historian and politician, was born at Freiburg in 1775, and was educated for the law. At first he was known only as a young and eloquent professor in the university of his

Rothschild
||
Rotteck.

Rotten-
burg
||
Rotterdam.

native town. But it was not very long before Rotteck appeared as a liberal politician. In that capacity he soon became prominent. Many of the periodicals of his party were established and maintained by his aid. Many of the abuses of the constitution were attacked by his pen. Among others, his pamphlets against standing armies, against the proposal to abolish the university of Freiburg, and on representative bodies, won for him the gratitude of his faction. He received the honour in 1819 of being the representative of his university in the first chamber of the states of Baden. Nor when the government began to persecute him did his popularity decline. His expulsion from the representativeship of the university was retrieved by his being made in 1831 the member for the city of Freiburg. His loss of his professorship was more than compensated by the presents and addresses that came to him from the most distant provinces of Germany. He even gained the respect of his opponents; and just before his death in 1840 he was restored to his chair. The work on which the fame of Rotteck now rests is his *Allgemeine Weltgeschichte* (German Universal History), originally published in 9 vols. in 1813-27. Its popularity has been very great. Almost every German family possesses a copy. There are few European languages into which it has not been translated. So long ago as 1841 the fifteenth edition was called for; and it was published, with a continuation by K. H. Hermes, in 11 vols. 8vo, 1841-45.

ROTTENBURG, a town of Wurtemberg, in the circle of Schwarzwald, stands in a picturesque situation on the left bank of the Neckar, 7 miles W. of Tubingen. It is walled, and entered by eight gates; while the suburb Elungen, on the other side of the river, is joined to the town proper by a bridge. Among the handsome houses which line its broad thoroughfares rise many ancient and interesting buildings; as the old castle of the counts of Hohenberg (now used as a prison), several former convents, a Jesuit college (now the episcopal palace), the cathedral of St Martin, and several other churches of much beauty. The manufactures of the place comprise musical instruments, glass, leather, paper, and other articles. Pop. 6610.

ROTUNDA, or ROTUNDO, a term applied to a building which is circular in its plan, both externally and internally. The technical application of the word is restricted to circular buildings whose height does not greatly exceed their diameter. The most celebrated rotunda of the ancients is the Pantheon at Rome, of which the external diameter is 188 feet; internal, 142; internal height, 142. The Radcliffe Library at Oxford is a polygon of sixteen sides and 104 feet in diameter; exterior height, 140 feet; interior diameter, 88 feet; interior height, 90 feet.

ROTTERDAM, a city of Holland, in size and commercial importance the second in the kingdom, capital of the province of South Holland, on the right bank of the Meuse, where it receives the Rotte, about 20 miles above its mouth, and 36 S.W. of Amsterdam. In form it is triangular, one side being formed by the river, which is lined for the distance of a mile and a quarter by the fine quay called the *Boompjes* ("little trees"), shaded with a row of fine elms, planted in 1615, and now no longer "little." Along this quay stands a range of some of the best houses in the town, four or five storeys high, and built of dark brick. The High Street (*Hoogstraat*) of Rotterdam extends along the great dyke or dam erected for the protection of the adjacent country against the overflowing of the Meuse. The ground between this dam and the Boompjes has been gained from the river since the building of the dam, and is now occupied by the most modern part of the town. Except the High Street, all the other thoroughfares of the place are traversed by canals in the centre, which intersect one another, and communicate with the river and with the

moat that surrounds the city. These canals are crossed by numerous draw-bridges, and at the wider parts by ferry-boats. The ebb and flow of the tide, which rises 10 or 12 feet, keeps the water in the canals always fresh, and prevents it from stagnating. To a stranger the appearance of Rotterdam is very quaint and striking, presenting, as it does, a confused mixture of lofty gables, trees, and masts of the shipping in the middle of the city. The houses, which have in general their gables turned towards the street, and project in the upper storeys some distance beyond their base, are in many cases large, lofty, and handsome. Those which belong to merchants generally comprise in one building both the place of business and the private residence of the owner; the former surrounding an inner court on the ground floor, and the latter approached in many of the houses by a marble staircase. The principal market-place of Rotterdam consists of a broad bridge across one of the canals, and contains a bronze statue of Erasmus, the most illustrious native of the town. The house where he was born, now a gin-shop, is pointed out, in the vicinity of the Great Church. This church, dedicated to St Lawrence, and completed in 1472, is built of brick, and though much defaced, is yet very beautiful in its architectural ornaments. Its tower commands an extensive view over the flat country, intersected with canals and avenues of trees, and dotted with farms, spires, and windmills. In the church are monuments to Admirals de Witt and Cortenaer, and Vice-Admiral van Brakel. The organ of this church is said by some to be superior even to the famous one at Haarlem; it is 90 feet high, has 90 stops, and 6500 pipes, the largest of which is 36 feet long, and 17 inches in diameter. The numerous other churches in the town are not very remarkable. The exchange is a very fine building, with a library and collection of philosophical instruments. The town-hall, however, is not nearly so fine as that of Amsterdam; and the dockyard, too, is inferior to that in the capital. In the vicinity is a botanic garden and several places of public resort and entertainment. The manufactures of Rotterdam are extensive and of much importance. Ship-building is one of the chief branches of industry; the total number of vessels built in 1856 being 227, tonnage 58,768. There are also sugar-houses, salt refineries, and manufactories of needles, pins, tobacco, and chemical substances. The trade of the port is very great. The following table exhibits the number and tonnage of the vessels that entered and cleared with cargoes for six years:—

Year.	Entered.		Cleared.	
	No.	Tonnage.	No	Tonnage.
1850. . . .	1818	379,543	1818	366,950
1851	1981	420,835	1655	369,992
1852	2039	476,485	1759	406,628
1853. . . .	1751	408,609	1687	367,231
1854	1962	454,187	1714	399,167
1855	2112	488,912	1602	392,153

The number of merchant ships and steamers belonging to the port in 1856 was 2372, tonnage 588,620. The commerce of Rotterdam is carried on by three channels: by sea, by land, and by the Rhine. The first of these is the most important; and indeed the prosperity of Rotterdam is owing in a great measure to its foreign trade. Antwerp formerly rivalled it in this respect; but since the separation of Holland and Belgium in 1830, the Dutch city has completely outstripped its competitor. Goods are imported from the Dutch possessions in the East and West Indies, from America, and from various countries in the north of Europe. The Netherlands Trading Company carries on an extensive commerce, especially with India, and until the end of 1859 enjoys many privileges. The

Roubaix value of their importations for 1855 and 1856 was as follows:—

Articles.	1855.	1856.
Coffee	L.3,561,675	L.3,539,000
Sugar	1,348,810	2,171,500
Spices	90,990	83,075
Pepper	11,740	24,125
Indigo	252,500	184,750
Cochineal	18,330	30,220
Banica tin	538,625	624,900
Cinnamon	8,450	4,889
Tea	77,560	105,740
Hides	10,520
Rattans	18,520	19,980
Total	L.5,927,200	L.6,798,699

Wheat, rye, wines, pottery, &c., are imported by the Rhine from Germany, and grain and timber from the Baltic. Rotterdam is connected by railway with Amsterdam and the other chief cities of Holland. Steamers ply from this port to London, Hull, Bristol, Liverpool, Newcastle, Leith, Glasgow, Hamburg, Dunkirk, Havre, Bordeaux, Marseilles, Leghorn, Cronstadt, and Stettin. Pop. (1855) 96,000.

ROUBAIX, a town of France, in the department of Nord, 6 miles N.E. of Lille. It is well and regularly built, though it has no striking public buildings. Its chief importance is derived from the manufactures that are carried on here, especially those of cotton goods, for which it is second only to Lille among the towns in the department. Besides these, woollen articles, table-linen, furniture, leather, &c., are made, and dyeing is also carried on. The trade of the place is very considerable, not only in these manufactured articles, but in corn, wine, and colonial produce. Roubaix is the seat of a court of commerce and a council of *prud'hommes*. Pop. 31,038.

ROUBILIAC, LOUIS FRANÇOIS, an eminent sculptor, was born at Lyons in France about 1695, and after studying under Balthazar of Dresden, came to London in 1720 to practise his profession. It was not long before the bustling little Frenchman began to exhibit in his calling all his national vivacity of temperament. His artistic enthusiasm knew no bounds. At dinner he would drop his knife and fork, and stare in wrapt attention at some new conception that had risen before the eye of his imagination. In company he would suddenly seize a lady's hand, and implore her to allow him to model it. Nor did his ardour cool when he took up the chisel. His figures were fashioned in the most excited attitudes. An intensity of expression, amounting even to grimace, was put into their faces. The very robes seemed instinct with tremor and agitation. These striking characteristics soon ensured to Roubiliac a very wide success. On the recommendation of Sir Edward Walpole, he was employed to erect a monument to John, Duke of Argyle and Greenwich, in Westminster Abbey. The ability with which he finished this undertaking gave publicity to his name. Other tombs in the same place were entrusted to his execution. Several of the aristocracy gave him commissions for busts. He was also honoured to execute the likenesses of some men of genius. So high, indeed, was his standing, that at his death in 1762 he left many works which must always be objects of national interest. There are his monuments in Westminster Abbey, including, besides the one already mentioned, "Joseph Gascoigne Nightingale and his Lady," "Sir Gilbert Lort," "Admiral Sir Peter Warren," "Field-Marshal Wade," "General Fleming," and "General Hargrave." There are also his busts of Milton, Dryden, Pope, and Sir Robert Walpole; and his statues of Shakespeare and Newton,—the former in the British Museum, and the latter in Trinity College, Cambridge. (See Cunningham's *British Painters*, &c.)

ROUEN (anc. *Rotomagus*), one of the principal towns

of France, anciently the capital of Normandy, and now of the department of Seine-Inférieure, on the Seine, 44 miles in a direct line, but twice as much by the river, above its mouth, and 70 N.N.W. of Paris. It stands on the right bank of the river, but has a suburb, St Sever, on the opposite side, connected with the main town by a suspension-bridge and by two others of stone, which meet in the middle on the island *de la Croix*, just above the town. Towards the land Rouen is encircled with hills; and viewed from these, it has an appearance such as few other cities can boast of. Over the roofs of the houses rise several vast Gothic ecclesiastical edifices; the cathedral in the midst sending up a spire that towers as high above the others in the town as they do over the house-tops. And with all this mediæval and romantic splendour there are not wanting the factory chimneys and masts of vessels in the Seine, which tell of the modern prosperity of the place. The same combination of different epochs is apparent on a nearer view of the town; the streets are narrow, crooked, and dirty, lined with houses built mostly of wood, and presenting generally their gables to the street. But these streets swarm with busy crowds, and a range of fine new buildings stretches along the quays on the bank of the Seine. The line of the old fortifications is occupied by a *boulevard* stretching in a semicircle round the town, and inclosing within it all the historical and architectural monuments of Rouen; while without are suburbs occupied chiefly by the working-classes. The cathedral of Notre Dame is one of the most conspicuous objects in the town, and is calculated at the first sight to excite the wonder and admiration of the spectator; but its decorations, though rich and profuse, are not always in good taste. The vast western front is flanked by two elegant and stately towers, and the centre surmounted by a spire, not in harmony with the rest of the building, 436 feet high. The interior, 435 feet in length and 89½ in height, is in the early pointed style, and has three beautiful rose windows in the nave and transepts. The principal monuments in the church are an ancient statue of Richard Cœur de Lion, whose heart was buried here; the tomb of Cardinal George d'Amboise, who was Archbishop of Rouen; and that of the Duc de Brégé, husband of Diana of Poitiers. The church of St Ouen, though inferior to the cathedral in the number of its monuments and historical associations, is larger and more elegant, being one of the finest Gothic buildings in the world, and executed almost entirely on a single plan, though its erection extended over nearly two centuries from its foundation in 1318. It is cruciform, and has in the centre a very beautiful octagonal tower 260 feet high. The interior, which is 443 feet long and 106½ high, is chiefly remarkable for its light and graceful character, which is enhanced by the great size of the windows, which are all filled with painted glass. Another fine church is that of St Maclou, chiefly remarkable for its triple porch in the florid style of the fifteenth century. Many of the other churches possess much interest: those of St Godard, St Patrice, and St Vincent contain greatly-admired specimens of stained glass; and that of St Gervais, in one of the suburbs, is one of the oldest Christian churches in France. The town-hall, standing close to the church of St Ouen, is a fine building in the Italian style, containing, besides the public offices, a library of 33,000 volumes and 1200 MSS., and a museum of paintings, of which some are good and a great many bad. The museum of antiquities, which occupies a suppressed convent, is exceedingly interesting, especially for its rich collection of mediæval remains. A fine specimen of the Gothic architecture of the end of the fifteenth century is furnished by the Palais de Justice, which contains the hall of the ancient Parliament of Normandy. There are several public squares in Rouen, the most memorable of which is that called the Place de la Pucelle, containing an indifferent

Rouen.

Roulers
||
Roundelay

statue of Joan of Arc, on the spot where her wonderful and eventful career was brought to an end. The site of the old castle of Rouen is occupied by a building called the Halles, or covered markets, consisting of a series of large halls for the sale of various kinds of merchandise, forming three sides of a square. As a manufacturing town, Rouen ranks next to Lyons, and is the chief seat of the cotton manufacture in France. The factories are driven either by water or by steam-power. Dyeing, bleaching, and printing of woollen and cotton fabrics are also carried on. Besides these, there are manufactures of muslin, lace, hosiery, handkerchiefs, ropes, blankets, paper, sugar, soap, and many other articles; as well as tanneries, breweries, ship-building yards, copper and iron foundries. The town is very favourably situated for commercial purposes, as it is connected both by railway and by the river with Paris on the one hand, and Havre on the other. Vessels of 250 or 300 tons come up to the stone bridge, above which there are large boats to convey the cargoes to the capital. The number of vessels belonging to the port is more than 100. The number that entered with cargoes in 1854 was 681, tonnage 68,274; in 1855 the number was 1060, tonnage 108,852. Those that cleared with cargoes in the former year were 341, tonnage 34,288; in the latter 380, tonnage 38,288. The chief articles of trade are corn, flour, wine, brandy, cider, oil, salt provisions, colonial produce, and manufactured articles. Rouen is the seat of an archbishop, of a high court of justice, and other tribunals, and contains a mint, custom-house, two clerical seminaries, a school of medicine, college, and other schools, four hospitals, two theatres, and several banks. The town is of great antiquity, having been under the Romans the capital of the province of Lugdunensis Secunda. About the middle of the ninth century it was taken by the Normans, and from that time till their conquest of England was the capital and residence of their dukes. In 1204 Philip II. of France wrested the duchy with its capital from the feeble hands of King John, and annexed it to the French crown. But in 1419 Henry V. besieged and took the town, which remained in English hands till 1449. In 1562 the Huguenots took possession of Rouen, but the Duke of Guise recovered it in the same year; and in 1593 it was taken by Henri IV. The most celebrated native of Rouen was Pierre Corneille; Fontenelle and other men of note were also born here. Pop. (1856) 94,645.

ROULERS (Flem. *Rousselaer*), a town of Belgium, in the province of West Flanders, in the midst of beautiful meadows, on a small affluent of the Lys, 17 miles S. of Bruges. The streets are broad and regular, lined with good houses; and in the centre is a market-place, where stand the long ancient town-hall, with its tower and elegant spire, and the small plain church of St Michael. The college of the town is a fine edifice, and the other schools are numerous. The people are mostly employed in making and bleaching linen; and there are also tanneries, breweries, distilleries, soap-works, &c. There is an active trade in flax, linen, and cattle. Pop. 10,770.

ROUNDELEY, RONDEAU, or RONDO, a sort of old poem, deriving its name, according to Ménage, from its form, and because it still turns back again to the first verse, and thus goes round. The common roundelay consists of thirteen verses, eight of which are in one rhyme and five in another. It is divided into couplets, at the end of the second and third of which the beginning of the roundelay is repeated, and that, if possible, in an equivocal or a punning sense. The roundelay is a popular poem in France, but is little known amongst us. Marrot and Voiture have succeeded the best in it. Rapin remarks, that if the roundelay be not very exquisite, it is intolerably bad. In all the ancient ones, observes Ménage, the verse preceding has a less complete sense, and yet joins agreeably with

that of the close, without depending necessarily thereon. Rousseau. This rule, well observed, makes the roundelay more ingenious, and is one of the artifices of the poem. Some of the older writers speak of the roundelay or roundel as a kind of air appropriated to dancing.

ROUSSEAU, JACQUES, an eminent French painter, was born at Paris in the year 1630. He studied first under Swanevelt, who had married one of his relations; after which he improved himself by travelling into Italy, practising perspective, architecture, and landscape. On his return home, he was employed at Marly. He distinguished himself very much in painting buildings. Louis XIV. employed him to decorate his hall of devices at St Germain-en-Laye, where he represented the operas of Lulli; but being a Protestant, he quitted France on the persecution of his brethren, and retired to Switzerland. Louis invited him back. He refused, but sent his designs, and recommended a proper person to execute them. After a short stay in Switzerland, he went to Holland, whence he was invited to England by Ralph, Duke of Montague, to adorn his new house in Bloomsbury. Here he painted a great deal. Some of his pictures, both in landscape and architecture, are over doors at Hampton Court; and he etched several of his own designs. His perspectives having been most commonly applied to decorate courts or gardens, have suffered much from the weather. Such of them as remain are monuments of an excellent genius. The colours are bright and durable, and the choice of them most judicious. He died in Soho Square in 1693 or 1694, at the age of sixty-four.

ROUSSEAU, *Jean Baptiste*, a French lyric poet, of very great merit, was born at Paris in April 1670. His father, who was a shoemaker in good circumstances, made him study in the best colleges of Paris, where he distinguished himself by his abilities. He at length applied entirely to poetry, and soon made himself known by several short pieces that were filled with lively and agreeable images, which made him sought for by persons of the first rank and men of the brightest genius. He was admitted as a pupil to the Academy of Inscriptions and Belles Lettres in 1701, and almost all the rest of his life he attached himself to some great men. He attended Marshal Tallard into England in the capacity of secretary, and there contracted a friendship with St Evremont. On his return to Paris, he was admitted into the politest company, lived amongst the courtiers, and seemed perfectly satisfied with his situation; when, in 1708, he was prosecuted for being the author of some couplets in which the characters of several persons of wit and merit were blackened by the most atrocious calumnies. This prosecution made much noise; and Rousseau was in 1712, by a decree of the Parliament of Paris, banished out of the kingdom, to which he was never more to return. However, he always steadily denied, even on his death-bed, his being the author of these couplets. From the date of this sentence he lived in foreign countries, where he found illustrious protectors. The Count de Luc, ambassador of France in Switzerland, took him into his family, and studied to render his life agreeable. At the treaty of Baden in 1714, he was one of the plenipotentiaries, and was presented to Prince Eugene, who, entertaining a particular esteem for him, took him to Vienna, and introduced him to the emperor's court. Rousseau lived about three years with Prince Eugene; but having lost his favour by satirizing one of his mistresses, he retired to Brussels, where he afterwards usually resided. It was there that he commenced his disputes with Voltaire, with whom he had become acquainted at the college of Louis the Great, and who then much admired his turn for poetry. Rousseau, from the period of their dispute, always represented Voltaire as a buffoon, and as a writer possessing neither taste nor judgment, who owed all his success to a

Rousseau. particular mode which he pursued. As a poet Rousseau considered him as inferior to Lucan, and little superior to Pradon. Voltaire treated him still worse. Rousseau, according to him, was nothing better than a plagiarist, who had nothing but the talent of arranging words. He came over in 1721 to London, where he printed his *Œuvres Diverses*, in two volumes 12mo. This edition, published in 1723, brought him near ten thousand crowns, the whole of which he placed in the hands of the Ostend Company. The affairs of this company, however, soon getting into confusion, those who had any money in their hands lost the whole of it; by which unfortunate event Rousseau, when arrived at that age when he stood most in need of the comforts of fortune, had nothing to depend upon but the generosity of his friends. He died at Brussels in February 1740. A very beautiful edition of his works was published in 1743 at Paris, in three volumes 4to, and in four volumes 12mo, containing nothing but what was acknowledged by the author as his own. His works, which contained odes, epistles, cantatas, allegories, epigrams, and comedies have been published at Paris by Amar, preceded by an essay on his life and writings, entitled *Œuvres Complètes*, 5 vols., 1820. His poetical works have likewise been published in the *Collection des Classiques Français*.

ROUSSEAU, Jean-Jacques, one of the most distinguished writers of the eighteenth century, was born at Geneva on the 28th of June 1712. His father was by profession a clock and watch maker. At his birth, which, he says, was the first of his misfortunes, he endangered the life of his mother; and he himself was for a long time afterwards in a very weak and languishing state of health. But as his bodily strength increased, his mental powers gradually opened, and afforded the happiest presages of future distinction. His father, a citizen of Geneva, was a well-informed tradesman; and in the place where he wrought he kept a Plutarch and a Tacitus, authors which, of course, soon became familiar to his son. Some acts of youthful misconduct compelled him to leave his native city. "Finding himself a fugitive in a strange country, and without money or friends, he changed his religion in order to procure a subsistence." Bornex, Bishop of Anneci, from whom he sought an asylum, committed the care of his education to Madame Warens, whose history and life were from this time identified with his, and whose benevolence Rousseau requited basely in his revelations of criminal conduct for which he was himself greatly if not chiefly to blame.

He possessed more than ordinary talents for music; and the Abbé Blanchard, to whom his education had been entrusted, flattered his hopes of a place in the royal chapel, which he, however, failed in obtaining for him. He was therefore under the necessity of teaching music at Chamberi. In this place he remained till 1741, in which year he went to Paris, where he was long in very destitute circumstances. But he at length began to emerge from that obscurity in which he had hitherto been buried; and his friends placed him with M. de Montaigne, French ambassador at Venice. According to his own confession, a proud misanthropy, and a peculiar contempt for the riches and pleasures of this world, constituted the chief traits in his character; and a misunderstanding soon took place between him and his employer. The place of depute, under M. Dupin, a wealthy farmer-general, gave him some temporary relief, and enabled him to show some kindness to Madame de Warens, his former benefactress. The year 1750 witnessed the commencement of his literary career. The academy of Dijon had proposed the following question: "Whether the revival of the arts and sciences has contributed to the refinement of manners?" Rousseau at first inclined to support the affirmative. "Take the negative side of the question," said Diderot, who was at that time his friend, "and I'll promise you the greatest

success." His discourse against the sciences having been found to be the best written, and replete with brilliant reasoning, was publicly crowned with the approbation of that learned body. Never was a paradox supported with greater eloquence. It was not, however, a new one; but he enriched it with all the advantages which either knowledge or genius could confer upon it. Immediately after its appearance he met with several opponents of his tenets, which he defended; and, from one dispute to another, he found himself involved in a formidable train of correspondence, without having ever almost dreamed of such opposition. From that period he decreased in happiness as he increased in celebrity. His *Discourse on the Causes of Inequality amongst Mankind*, and on the *Origin of Social Compacts*, was written with a view to prove that mankind are equal; that they were born to live apart from each other; and that they have perverted the order of nature in forming societies. He bestows the highest praise on the State of Nature, and deprecates the idea of every social compact. By presenting this performance to the magistrates of Geneva he was received again into his native country, and re-instated in all the privileges and rights of a citizen, after having with much difficulty prevailed on himself to abjure the Catholic religion. He soon returned to France, however, and lived for some time in Paris. He afterwards gave himself up to retirement, partly to escape the shafts of criticism, and partly to follow the regimen rendered necessary by the painful disease under which he laboured. This is an important epoch in the history of his life, as it was owing to this circumstance, perhaps, that we have the most eloquent works that have proceeded from his pen. His Letter to M. D'Alembert on the design of erecting a theatre at Geneva, written in his retirement, and published in the year 1757, contains, along with some paradoxes, some very important and well-handled truths. Although so great an enemy to theatrical representations, he caused a comedy to be printed; and in 1752 he gave to the theatre a pastoral, called *Le Devin du Village*, of which he composed the poetry and the music, both of them abounding with sentiment and elegance, and full of innocent rural simplicity. His *Dictionary of Music* contains some good but many more indifferent articles. Soon after the rapid success of his *Village Conjuror*, he published a Letter on French Music, or rather against French Music, written with equal freedom and liveliness. The exasperated partisans of French comedy treated him with as much fury as if he had conspired against the state; and a crowd of enthusiasts spent their strength in loud and open menaces against him.

That interesting and tender style which is so conspicuous throughout the *Devin du Village* marks many of the letters in the *Nouvelle Heloise*, which was published in 1761. This epistolary romance, of which the plot is ill managed, and the arrangement bad, has great beauties as well as great faults. Some of the letters are indeed admirable, from their force and warmth of expression as well as their intensity of passion, from an effervescence of sentiment, and from the irregularity of ideas which always characterises a passion carried to its height. In the *Heloise* Rousseau's unlucky talent of rendering everything problematical appears very conspicuous. This is the case in his arguments in favour of and against duelling, which afford an apology for suicide, and a just condemnation of it; his facility in palliating the crime of adultery, and his strong reasons to make it abhorred; his declamations against social happiness, and transports in favour of humanity; his violent rhapsodies against philosophers, and his rage for adopting their opinions; the existence of God attacked by sophistry, and atheists confuted by the most irrefragable arguments; the Christian religion combated by the most specious objections, and celebrated by the most sublime eulogies.

Rousseau.

Rousseau.

His next work, *Emile*, made more noise than its predecessor. This moral romance, which was published in the year 1762, treats chiefly of education. Rousseau wished to follow nature in everything; and though much of his system was quite impracticable, yet many of his hints and suggestions have been followed out, and with good effect, by practical teachers. His precepts are expressed with the force and dignity of a mind full of the leading truths of morality. If he has not always been virtuous, nobody at least has felt virtue more, or made it appear to greater advantage. What is most to be lamented is, that in wishing to educate a young man as a Christian, he has filled a volume with objections against Christianity. On the other hand, it must be confessed that he has given a very sublime eulogium on the gospel, and an affecting portrait of its divine Author; but the miracles and the prophecies which serve to establish his mission he attacks without reserve. Admitting only natural religion, he weighs everything in the balance of reason; and this reason being false, leads him into dilemmas which are very unfavourable to his own repose and happiness. The French Parliament condemned this book in 1762, and by instituting a criminal prosecution against the author forced him to make a precipitate retreat from France. He directed his steps towards his native town, but it shut its gates upon him. Proscribed in the place where he had first drawn breath, he sought an asylum in Switzerland, and found one in the principality of Neuchâtel. But the protection of the King of Prussia, to whom the principality belonged, was not sufficient to rescue him from that obloquy which the minister of Moutiers-Travers, the village to which he had retired, had excited against him. He preached against Rousseau, and his sermons produced an uproar amongst the people. One night some fanatics, inspired by wine and the declamations of their minister, threw stones at the windows of the Genevese philosopher, who, fearing new insults, sought an asylum in the canton of Berne. As this canton was connected with the republic of Geneva, the authorities did not think proper to allow him to remain in their city. Neither his broken health nor the approach of winter could soften their hearts. To relieve them from all anxiety about the spread of his opinions, he besought them to shut him up in prison till the spring. But even this favour was denied him. Obligated to set out on a journey in the beginning of a most inclement season, he reached Strasbourg in a very destitute condition. From Strasbourg he proceeded in the autumn of 1765 to Paris, where the protection of the Prince de Conti, and his own eccentricities of life and opinions, made him once more the lion of the hour. Among the notable men whose acquaintance he formed in the course of this winter was the philosopher David Hume, on whose invitation he visited England in the spring of 1766. Hume's conduct to his guest was marked by a delicacy and good sense beyond all praise. The new friends settled at Wootton in Derbyshire, where, however, they had not resided three months when the morbid vanity and diseased imagination of the Frenchman discovered in some very innocent acts of "ce bon David" a deep-laid scheme for ruining his peace and hopes of literary glory. A letter of Horace Walpole, written under the name of the King of Prussia, and in which Rousseau's mania of believing himself persecuted by the whole world was held up to ridicule, led to an irreparable breach between the two philosophers. In his celebrated *Letter to a Member of the National Assembly* Burke alludes to this period of Rousseau's life in the following terms:—"We have had the great professor and founder of the philosophy of vanity in England. As I had good opportunity of knowing his proceedings almost from day to day, he left no doubt on my mind that he entertained no principle either to influence his heart or to guide his understanding but vanity. With this vice he was pos-

sessed to a degree little short of madness" Rousseau accordingly returned to France, spited with the world, and particularly offended with the English philosopher. In July 1770 he appeared for the first time at the Café de la Régence dressed in ordinary attire, having laid aside the Armenian dress in which he is generally represented in the best portraits of him that now exist. He was loaded with praises by the surrounding multitude. "It was somewhat singular," says M. Sennequier, "to see a man so haughty as he returning to the very place from whence he had been banished so often. Nor is it one of the smallest inconsistencies of this extraordinary character, that he preferred a retreat in that place of which he had spoken so much ill." It is as singular that a person under sentence of imprisonment should wish to live in so public a manner in the very place where his sentence was in force against him. His friends, however, procured for him the liberty of staying, on condition that he should write neither on religion nor on politics; and he kept his word, for he ceased to write altogether. He was contented with living in quiet seclusion in the society of a few tried friends, shunning the company of the great, and giving up all his old eccentricities. He died of apoplexy at Erménonville, about ten leagues from Paris, July 2, 1778, at the age of sixty-six years.

Much of the unhappiness of Rousseau's life is to be attributed to the marriage which he contracted while living in the neighbourhood of Lyons with a woman named Thérèse Levasseur, who, though poor, ugly, and ill-tempered, exercised over her husband the empire of a nurse over a child. Her conduct and influence had the effect of driving away from his house the few friends whose society was either useful or agreeable to him, and of confirming him in those vices and eccentricities to which he was naturally prone. He sent his children into orphan hospitals as soon as they were born, rather than take upon himself the charge of their maintenance and education. It is to this part of his conduct Burke alludes in the *Letter* already quoted:—"He melts with tenderness for those only who touch him by the remotest relation, and then without one natural pang casts away, as a sort of offal and excrement, the spawn of his disgusting amours, and sends his children to the hospital of foundlings. The bear loves, licks, and forms her young; but bears are not philosophers. Vanity, however, finds its account in reversing the train of our natural feelings. Thousands admire the sentimental writer; the affectionate father is hardly known in his parish." The unsocial habits of Rousseau, and his strange ways, both of living and thinking, which can only be explained and may be partly, at least, excused by the plea of insanity, made him an object of curiosity, and helped to procure him a name. Like Diogenes of old, he united simplicity of manners with pride of genius; and a very large stock of indolence, with an extreme sensibility, served to render his character still more uncommon. "An indolent mind," says he, "terrified at every application, a warm, bilious, and irritable temperament, sensible also in a high degree to every thing that can affect it, appear not possible to be united in the same person; and yet these two contraries compose the chief of mine. An active life has no charms for me. I would an hundred times rather consent to be idle than to do anything against my will; and I have an hundred times thought that I would not live amiss in the Bastille, provided I had nothing to do but just continue there. In my younger days I made several attempts to get in there; but as they were only with the view of procuring a refuge and rest in my old age, and, like the exertions of an indolent person, only by fits and starts, they were never attended with the smallest success. When misfortunes came, they afforded me a pretext for giving myself up to my ruling passion."

His ideas on politics were as eccentric as his paradoxes

Rousseau.

Roussillon about religion. Some reckon his *Social Compact*, which Voltaire calls the Unsocial Compact, the greatest effort of his genius; whilst others find it full of contradictions, errors, and cynical passages, obscure, ill arranged, and by no means worthy of his pen. There were found in his portfolio his *Confessions*, in twelve books; the first six of which were published. "His *Confessions*," says Senne-
 Ruvigno. bier, in his *Literary History of Geneva*, "appear to me to be a very dangerous book, and paint Rousseau in such colours as we would never have ventured to apply to him. The excellent analysis which we meet with of some sentiments, and the delicate anatomy which he makes of some actions, are not sufficient to counterbalance the detestable matter which is found in them, and the unceasing obloquies everywhere to be met with." Amongst his other posthumous pieces are the following:—*The Reveries of a Solitary Wanderer*, being a journal of the latter part of his life; *Considerations upon the Government of Poland*; *The Adventures of Lord Edward*, a novel, being a kind of supplement to the *New Heloise*; various memoirs and fugitive pieces, with a great number of letters, containing some eloquent passages and deep thoughts; *Emilia and Sophia*; *The Levite of Ephraim*, a poem in prose, in four cantos, written in a style of ancient simplicity; *Letters to Sara*; an Opera and a Comedy; translations of the first book of Tacitus's *History*, of the episode of *Olinda and Sophronia*, from Tasso, &c. Like all the other writings of Rousseau, we find in these posthumous pieces many admirable and some useful things; but they also abound with contradictions, paradoxes, and ideas very unfavourable to religion. In his letters, especially, we see a man chagrined at misfortunes which he never attributes to himself; suspicious of everybody about him, calling and believing himself a lamb in the midst of wolves. Viewing him solely as a writer, his character is perhaps described with truth and accuracy in the following words of Hume:—"Though I see some tincture of extravagance in all his writings, I also think I see so much eloquence and force of imagination, such an energy of expression, and such a boldness of conception, as entitle him to a place amongst the first writers of his age." A complete edition of his works was published in 1788 and the following years, extending to thirty-seven volumes octavo. The best edition, however, is that published by Musset-Pathay, his biographer, Paris, 1823-25, 20 vols. 8vo. M. Villemain has given an analysis and criticism of the works of Rousseau in his recent *Cours de Littérature Française au 18th siècle*.

ROUSSILLON, an ancient province of France, bounded on the N. by that of Languedoc, W. by that of Foix, S. by Spain, and E. by the Mediterranean. It is now wholly comprised in the department of Pyrénées Orientales.

ROVEREDO, (Germ. *Rovereth*), a town of the Austrian empire, in the Tyrol, on the left bank of the Adige, 34 miles N. of Verona. It is handsomely built, many of the houses being of marble. The most conspicuous building in the place is the old castle, on the summit of a rock, towering above the public square. The principal church is a building of the fifteenth century; and another, now used as a warehouse, is said to be of greater antiquity. Roveredo is the chief seat of the silk manufacture in the Tyrol; and there are more than 50 mills in the town and vicinity. Upwards of 120,000 lb. of silk are exported annually. Leather and pottery are also made, and there are dye-works. Abundance of fruit and excellent wine is obtained in the vicinity. Pop. (1854) 11,115.

ROVIGNO, or TREVIGNO, a town of the Austrian empire, in the circle of Istria, on a rocky promontory on the Adriatic shore, 40 miles S. of Trieste. It has a cathedral, after the model of St Mark's at Venice, numerous other churches, courts of law, schools, and hospitals. There

are two harbours, one of which is pretty safe. The inhabitants are chiefly employed in seafaring pursuits, and in fishing, especially for sardines, which produce a profit of about L.15,000 annually. Ship-building is carried on here; cables, sail-cloth, &c., are manufactured; and there is a considerable coasting trade. Pop. 10,920.

ROVIGO, a province of Austrian Italy, in the crown-land of Venice, forming a sort of peninsula between the Adige, the Po, and the Adriatic; bounded on the N. by the provinces of Padua and Vicenza, W. by those of Verona and Mantua, S. by the Papal States, and E. by the Adriatic: length, from E to W., 35 miles; breadth, about 15; area, 428 square miles. It is flat and fertile, traversed by several canals, and covered with vineyards and fields of wheat, maize, rice, hay, &c. Cattle are raised in large numbers. The province is divided into eight districts. Pop. (1853) 176,814. The capital is Rovigo, a town on both sides of the Adigetto, an arm of the Adige, 36 miles S.W. of Venice. It has a castle, and is fortified after the old fashion, with walls, towers, and a moat. Among the chief buildings are a fine cathedral, and the palace of the Bishop of Adria, who generally resides here on account of the unhealthy climate of Adria. There are also a gymnasium, episcopal seminary, theatre, picture gallery, government-house, and courts of law. Tanneries and saltpetre works are the chief manufactures; and corn is the principal article of trade. The wine of Rovigo was anciently celebrated, but is not now above mediocrity. Pop. 12,600.

ROWANDIZ, or RAWANDIZ, a town of Asiatic Turkey, in the pashalic and 230 miles N. of Bagdad, among the mountains which separate the plains of Assyria from those of Media, on an affluent of the Great Zab. Its position is extremely striking and picturesque. Amid lofty and steep limestone cliffs, it occupies a sloping tongue of rock, with a ravine on the east, and another on the north, through which the river flows. The houses rise in tiers one above another, and have generally flat roofs, without walls round them. The river is only about 10 yards wide and 1 deep, but very rapid and impetuous; and the ravine is crossed at the height of 20 feet above the water by a bridge of trees, which may be removed to secure the place against an attack from the north. Rowandiz has only from 1000 to 2000 houses, but each of them contains two or three families, and the population is very dense. The inhabitants belong chiefly to the tribe of Rewendis, and are under a chieftain, who maintains some degree of independence, aided by the mountain fastnesses and numerous castles in the neighbourhood.

ROWE, NICHOLAS, a poet and dramatist of some distinction, was descended from an ancient family in Devonshire, and was born at Little Barford in Bedfordshire about 1673. He acquired a strong taste for the classical authors under Dr Busby in Westminster school; but poetry was his early and darling study. His father, who was a lawyer, entered him a student in the Middle Temple, and he made remarkable advances in the study of the law; but the love of the belles lettres, and of poetry, interfered with his legal career. His first tragedy, the *Ambitious Stepmother*, meeting with considerable applause, he laid aside all thoughts of rising by the law, and afterwards composed several tragedies; but that which he valued himself most upon was his *Tamerlane*. The others were the *Fair Penitent*, almost wholly borrowed from the *Fatal Dowry* of Massinger, *Ulysses*, the *Royal Concert*, *June Shore*, and *Lady Jane Grey*. He also wrote a farce called the *Biter*, which Congreve in his correspondence says "was damned." He likewise wrote several poems upon different subjects, which have been published under the title of *Miscellaneous Works*, in one volume, as his dramatic works have been in two.

Meanwhile the love of poetry and books did not make

Rovigo
 ||
 Rowe.

Rowley. him unfit for business; for nobody applied closer to it when occasion required. The Duke of Queensberry, when secretary of state, made him secretary for public affairs. But after the duke's death all avenues to his preferment were stopped: and during the remainder of Queen Anne's reign he passed his time with the Muses and his books. On the accession of George I., however, he was made poet-laureate on the 1st August 1715, and one of the land-surveyors of the customs in the port of London. The Prince of Wales conferred on him the clerkship of his council; and the Lord Chancellor Parker made him his secretary for the presentations. But he did not enjoy these promotions long. He died on the 6th of December 1718, in his forty-fifth year.

Rowe was twice married, had a son by his first wife, and a daughter by his second. He was a very handsome man; and his mind was as amiable as his person. He was buried in Westminster Abbey, opposite to Chaucer, where his widow erected an elegant monument to him, containing a bust by Rysbrack, and an epitaph by Pope.

Rowe is chiefly to be considered in the light of a tragic writer and a translator. In his attempt at comedy, he failed so ignominiously that his *Biter* is not inserted in his works; and his occasional poems and short compositions are rarely worthy either of praise or censure, for they seem to be the casual sports of a mind seeking rather to amuse its leisure than to exercise its powers. In the construction of his dramas there is not much art; and he is not a nice observer of the unities. "I know not," says Dr Johnson, "that there can be found in his plays any deep search into nature, any accurate discrimination of kindred qualities, or nice display of passion in its progress. All is general and undefined. Nor does he much interest or affect the auditor, except in *Jane Shore*, who is always seen and heard with pity. Alicia is a character of empty noise, with no resemblance to real sorrow or to natural madness. Whence then has Rowe acquired his reputation? From the reasonableness and propriety of some of his scenes, from the elegance of his diction, and from the suavity of his verse. He seldom moves either pity or terror, but he often elevates the sentiment; he seldom pierces the breast, but he always delights the ear, and often improves the understanding." Being a great admirer of Shakspeare, he gave the public an edition of his plays, to which he prefixed an account of his life. He even professed to have imitated the dramatist in his *Royal Convert*; and Pope ridiculed this profession in his *Martinus Scriblerus*, by stating that the resemblance was confined to one single line, "And so good morrow t'ye good Master Lieutenant." But the most considerable of Rowe's performances was an excellent translation of Lucan's *Pharsalia*, which he just lived to finish, but not to publish; it did not appear in print till 1728, ten years after his death.

ROWLEY, WILLIAM, an English dramatic writer of very considerable ability, and of whom hardly anything is known, seems to have flourished during the early part of the seventeenth century. He witnessed during his life three sovereigns on the throne, Elizabeth, James I., and Charles I. He was educated at Cambridge, for Wood has recorded of him that he was "the ornament for wit and ingenuity of Pembroke Hall in Cambridge;" and it is of him most probably Meres, in the second part of his *Wits Commonwealth*, 1598, speaks, when he says, "Maister Rowley, once a rare scholar of Pembroke Hall in Cambridge." He belonged to the royal company of players, and as an actor excelled most in comedy. He was on terms of close intimacy with all the reigning poets and wits of his time, and is known to have aided many of them in the composition of works for the stage, as well as having himself written a number of able comedies and tragedies, which were acted with "great applause" during his own time. In Charles Lamb's *Specimens of English Dramatic*

Poets, there are extracts given from the following works: *A Fair Quarrel*, by T. Middleton and W. Rowley; *All's Lost by Lust*, a tragedy, by W. Rowley; *A New Wonder*, *A Woman Never Vext*, a comedy, by W. Rowley; *The Witch of Edmonton*, a tragi-comedy, by Rowley, Decker, and Ford; *The Old Law*, a comedy, by Massinger, Middleton, and Rowley; *Fortune by Land and Sea*, by Heywood and Rowley. Speaking of *The Old Law*, Lamb remarks, "There is an exquisiteness of moral sensibility making one to gush out tears of delight, and a poetical strangeness in all the improbable circumstances of this wild play, which are unlike anything in the dramas which Massinger wrote alone. The pathos is of a subtler edge; Middleton and Rowley, who assisted in this play, had both of them finer geniuses than their associate." Several others of Rowley's plays will be found in Dodsley's *Collection*, and in Watt's *Bibliotheca Britannica*. Shakspeare is said to have assisted Rowley in the composition of his *Birth of Merlin*, 1662.

ROWNO, a town of European Russia, capital of a circle in the government of Wollhynia, on the Ustja, 116 miles N.N.W. of Jitomir. It has four churches, a gymnasium, two benevolent institutions, and some manufactures. Pop. 4875.

ROXANA, the daughter of Oxyartes, a Bactrian prince, became the queen of Alexander the Great about 327 B.C. She had not long enjoyed her high dignity before misfortunes began to gather round her. Her husband died before her child was born. The fear lest her progeny should be deprived of its paternal rights changed her nature into that of a tigress. She could not rest until she had decoyed her rival Barsine to Babylon and murdered her. Even when her son had been acknowledged heir to his father's kingdom, there was no peace for her. In the struggles which ensued between the several potentates in the Alexandrian empire, she and her boy were tossed about from the custody of one to that of another. At length they became involved in the fortunes of the ambitious Olympias, and their fate was sealed. Cassander captured them in Pydna in 316 B.C. They were degraded from their royal dignity, and consigned to the citadel of Amphipolis. After languishing there for five years, they were secretly murdered by their keeper Glaucias in 311 B.C.

ROXBURGHSHIRE, one of the south-eastern counties of Scotland, is bounded on the E. and S. by Northumberland and Cumberland; on the S.W. by Dumfriesshire; on the W. by Selkirk and Mid-Lothian; and on the N. and N.E. by Berwickshire. It is strictly a border county, its southern limit occupying nearly the whole of the border line, except a limited space at the eastern and western extremities. Its outline is very unequal, but the principal mass may be regarded as forming an irregular rhomboid, throwing out a projecting angle to the N., where it touches on Mid-Lothian, and another to the S., composing the basin of the Liddle, where it declines towards the English border. Its greatest length, from the north-eastern to the south-western extremity, is 43 miles, and its greatest breadth about 30; its superficial extent, according to the latest authorities, being 696 square miles, or 446,440 acres.

The Teviot being the only considerable river wholly included within the limits of the county, its basin comprehends by far the largest portion of its area, and from this circumstance the entire district was formerly called Teviotdale. It includes also Liddesdale, an outlying fragment, as it were, of the county, and belonging to a river system extraneous to it, which finds its outlet in the Solway. The valley of the Tweed occupies the northern portion, running in a transverse direction, and uniting with that of the Teviot near Kelso. These great natural features, taken in connection with the mountain ranges, in which the rivers

Rowno
||
Roxburgh-
shire.

Roxburgh-
shire.

originate, and to which they owe their direction, will enable us to form a pretty accurate conception of the physical aspect of the district. On the S. and S.E. the county may be said to be set in a frame of mountains, forming a pretty continuous ridge, and throwing off lateral offshoots, which gradually decline in height till they sink into the low lands bordering on the rivers. On the N.E. side they expand into the somewhat extensive group of the Cheviots, and in the S.W. they form a strictly mountainous country, often rising to a considerable elevation, presenting elongated ridges and insulated hills, sometimes rugged and rocky, but more frequently with rounded outlines, and densely clothed with grass to the very summits. The whole of this district is pre-eminently of a pastoral character, and the dense, fine herbage which everywhere covers the surface rears vast numbers of the finest sheep the county produces. This part of the county is almost destitute of wood, a few patches of dark pines in the valleys alone diversifying the view, or, rarer still, a scattered group of aged birch trees, the relics of primeval and natural woods, hanging on the slopes of the hills. Cultivation is scarcely practicable here, save on the low valleys by the side of the streams, where patches of corn and turnips are occasionally reared; and this state of things continues along the course of the Teviot nearly to the vicinity of Hawick, the country gradually becoming more level, and undergoing a great improvement in soil and climate, which admits of extended cultivation, and the rearing of almost any kind of crop cultivated in the country. Below this, further amelioration of climate, both in regard to temperature and dryness, is perceptible; woods not only skirt the banks of the river, but are scattered over the upland localities, and a wide district on either side presents all the features of a highly-cultivated and flourishing country. Frequent hills and abrupt eminences, arising from the obtrusion of igneous rocks, diversify the surface, which is everywhere varied, undulating, and beautiful. Still further down, the valley of the Teviot becomes more and more expansive, till it ultimately becomes blended with that of the Tweed, and both open up into a wide expanse of champaign country, which for richness of soil, extent of woodland, and general beauty of scenery, is well known to be surpassed by few places in the kingdom. The transverse valleys formed by the various affluents of the Teviot from the N. and S.E. also present features of great interest, and exhibit a peculiarity in their scenery owing to the nature of the geological formation through which they flow. That formation consists of the old red sandstone, and being for the most part of a soft and crumbling consistency, it has gradually given way to the action of the currents, and they have scooped out for themselves a deep channel in the rock. "They form deep and narrow defiles, often finely wooded, in which scaur, and wood, and water, and green mound-like banks, are blended into scenes of sequestered and varied beauty, such as the general aspect of the country scarcely promises. The high scaurs are generally in one place, confined to one of the banks, and the horizontal lines, in this nearly perpendicular wall, are sufficiently broken by the windings of the stream and overhanging wood, to prevent them becoming monotonous; while their deep tints present a mass of colour so agreeably contrasting with the fringing foliage as to add materially to the general effect. Though destitute, therefore, of the most characteristic features of rock scenery, properly so called, they are possessed of others which form a good substitute, and which cannot fail to recommend them to the eye of taste. The most interesting examples of this style of landscape are to be found in the lower course of the Jed; and though not on a large scale, they have long en-

joyed a well-merited reputation. Others of a similar kind occur on the Ale near Ancrum, on the Rule near Wells, on the Kale, and in the Dean above Denholm. As an instance of the same thing lying in the region of the conglomerate, may be mentioned the wooded dell at Hassen-dean Burn above Lurden. The precipitous banks in this spot are of a remarkably sombre hue; there are no lines of stratification, and the projections are blunt or rounded masses, with no appearance of the numerous small angles naturally formed by the breakage of stone having a minutely granular structure."¹

The Teviot, pre-eminently the county river, takes its rise at a place called Teviotstone, on the E. side of the mountain range which divides the county from Dumfriesshire. It pursues a very direct course in a N.E. direction, almost bisecting the county, and after a run of about 40 miles, in which it passes many a spot famous in border story, falls into the Tweed a little above Kelso. The general direction and undeviating nature of its course, at least in its upper half, is owing to the disposition of the Silurian strata through which it flows, the vertical masses of the rock being almost invariably arranged from N.E. to S.W., while their slaty structure and rather soft consistency give full effect to the abrading power of the current. This river was once famous as a trouting stream, and has been celebrated in poetry for the limpid clearness of its "silver tide;" but in both these respects there has of late years been a great change to the worse, partly from causes which are probably of very general operation in such cases, and partly from others of a more local nature. Owing to extensive drainage and other agricultural improvements, all superfluous rain-water falling on the fields is speedily conveyed to the river and its tributaries; sudden floods are the consequence; and as the water is rapidly carried off, the floods subside almost as rapidly as they rise. From the same causes, in seasons of drought the river is often reduced to a very low ebb. This tendency to extremes, and these sudden and violent changes, are unfavourable to the finny tribes, and seriously disturb both their breeding and feeding places. But a much greater evil arises from the great quantity of soap-suds and dye-stuffs discharged into the river from the manufactories of Hawick. These deleterious substances taint and discolour the water for many miles below that town, until they at length become diluted by the afflux of fresh streams, when their effects become less felt, or at least less apparent. Besides being directly injurious to the fish, these matters we know to be poisonous to the aquatic flies when in their larva state, on which they chiefly feed, and these are accordingly becoming much scarcer. No longer, then, can we exclaim with its native poet Leyden,—

"Untainted yet thy stream, fair Teviot, flows."

This contamination, which must have other injurious effects besides those alluded to, and which is becoming too common in other localities similarly situated, is the more to be deprecated, from the consideration that, by a little care and expense, it might be altogether avoided. The principal tributaries of the Teviot on the north-west side are the Borthwick and the Ale, both rising in Selkirkshire, the former flowing through a pastoral country similar to that surrounding the upper reaches of the Teviot, and joining the main stream nearly opposite Goudilands, a little above Hawick; the latter having its influx at Ancrum, among magnificent woods and romantic scenery, the last of which it principally contributes to create, by cutting deeply into the stratified rocks and producing lofty mural precipices of deep red sandstone. The affluent streams from the south are numerous, the principal being the Allan, the Slitrig,

Roxburgh-
shire

¹ "Geology of Roxburghshire," by the Rev. James Duncan, in Jeffrey's *History* of the county, vol i., p. 130.

Roxburgh-
shire.

the Rule, the Jed, the Oxnam, and the Kale. They all originate in the high grounds that skirt the county towards the English border, flow nearly due north, and join the main stream at an angle more or less acute. The only exception to this is the Kale, which has a more western course, and it doubtless owes its deviation from the prevailing arrangement to the disturbing influence of the Cheviot porphyries, whose operation is still further shown in this quarter by an irregularity in the course of the Teviot itself. Each of these tributary streams presents peculiar features both in natural scenery and in other properties. Such of them as flow through the Silurian district are often very impetuous in their course when under flood, carrying along with them large boulders of greenstone, and overflowing the low-lying lands on their banks. Hawick has frequently suffered in this way from the inundations of the Slitrig. The Jed, one of the most considerable of these tributaries, from the length of its course, is likewise the most celebrated both for its scenery and historical associations. It rises near Needlaw, not far from the southern border, flows at first due north, then suddenly bends to the east, after which it resumes the normal direction, and continues by Old Jedburgh, Fernihurst, and Jedburgh, to the Teviot. The peculiar and highly interesting physiognomy it gives to the landscape, arising from its action on the rocks which prevail throughout the greater part of its course, has been already alluded to. In the vicinity of the town to which the river gives its name the valley opens to some width, the banks are richly clothed both with natural wood and timber trees, and from the road, which follows more or less the windings of the stream, frequent views of the high and deeply-tinted scaurs are obtained, as well as occasional glimpses of the lofty tower and lengthened roof of the abbey; the whole presenting a scene of great interest and picturesque beauty. The other smaller rivers, such as the Gala, Leader, Eden, and Beaumont, belong only partially to the county; and though this is likewise the case with the Liddel and Tweed, these two rivers occupy a prominent place in the history of the district. The latter enters the county near the point where it is joined by the Ettrick, and after a very winding course of about 30 miles in an eastern direction, leaves it at the influx of the Carham-burn. The Roxburghshire section of this noble river passes through scenes of rich and varied beauty, which have also been the theatre of events of the highest national interest and importance. The Liddel rises near the sources of the Jed, and follows an exactly opposite direction; and after receiving the waters of the Hermitage, proceeds southwards by Castleton and Manger-ton, leaving the boundaries of the county at Liddelbank.

The lochs form so insignificant a feature in the physical aspect of the county that they scarcely seem to merit special notice in a cursory view of its hydrography. They are both few in number and of inconsiderable dimensions, and some of them are gradually diminishing, while others have entirely disappeared under the influence of drainage and agricultural improvements. We have not yet learned in this country to turn our permanent reservoirs of water to useful account in the production of human food, although they are susceptible of being rendered even more profitable in this respect than an equal extent of land. Yetholm or Primside Loch, which is the largest, is about a mile and a half in circumference; Hoselaw, in Linton parish, three-quarters of a mile. Several small sheets of water exist in Ashkirk parish, and a few others in Roberton. They occur amid very wild and sequestered scenes, are the favourite haunts of a considerable number of aquatic birds, and in

some of them the black-headed gull finds a suitable breeding-place. Roxburgh-
shire.

The geology of the county is of considerable interest, owing to the variety of formations met with, consisting of the older rocks, and also for the organic remains which have lately been discovered. The Silurian rocks, which are so extensively developed in the southern division of Scotland, and which occupy almost the entire area of the adjoining counties of Selkirk and Peebles, also prevail in this county, extending over the whole western side, also on the south, and more or less on the south-east. The rock is very distinctly stratified, the strata standing on their edge, or nearly vertical, and the direction east and west, with slight deviations. It is of a fine texture, often running into clay-slate, of a bluish-grey colour, glimmering with minute scales of mica, and frequently traversed by veins of calcareous spar. This is succeeded to the eastward by an extensive deposit of the old red sandstone, forming an irregular quadrangular area towards the centre of the county, emitting two angular projections from its southern extremity, and interrupted in the middle of its north side by an intrusion of trap-rocks. It consists of three well-marked modifications: the conglomerate, which is the lowest of the series; the dark brownish-red somewhat earthy-looking mass, traversed by whitish or grey-coloured beds of marly matter, composing the scaurs formerly alluded to; and the compact red and white sandstones in the higher parts of the county used as building-stone. To the east of this there is a considerable portion of the county composed chiefly of dark greenstone; and around Kelso, and thence down the valley of the Tweed, the under-division of the coal formation prevails. This formation is also developed in Liddesdale.

According to Professor Nicol, the real axis of the old unfossiliferous greywacke ranges by Teviotdale, and corresponds to certain Silurian strata in Wales. It is certainly the fact that fossils are very rare in the Roxburghshire greywacke strata, but they have by no means been examined with sufficient care to justify us in asserting their non-existence. Until very lately the same thing was affirmed of the red sandstone, and it was accordingly difficult to determine its geological position; it has been described as the new red sandstone. Recently a new light has been thrown on the subject by the investigations of Mr Duncan of Denholm, who has discovered numerous fossils of the old red sandstone era, and has thus determined its real character. Fossil fishes, of the genus *Pterichthys* and *Holoptychius*, the scales of the latter occurring in some places in such quantities as actually to form beds, have been detected. Plants have been found in still greater number and variety, the fucoids being very plentiful in certain strata uncovered at Denholm Hill quarry, and in impressions remarkably distinct and characteristic. Vegetables of higher organization have likewise occurred,—what appears to be a species of fern (*Cyclopteris hibernicus*) and distinct petrifications of calamites. These were previously unknown in the upper beds of the old red, and their occurrence is therefore regarded as a matter of considerable geological interest.¹

The diversified nature of the county, and the beautiful and romantic scenery so frequently met with, is chiefly owing to the eruption of igneous rocks, frequently in the form of insulated hills. These consist for the most part of a dark augitic greenstone, somewhat resembling clinkstone in texture, and not unlike basalt in colour. Such are Penielheugh, Dunian, Ruberslaw, Minto Craigs, Southdean Hill, Windburgh, &c. The form, position, and colour

¹ For a detailed account of these fossils, see the work referred to in the previous note, and Hugh Miller's remarks on them in the *Testimony of the Rocks*, p. 452.

Roxburgh-shire of the beautiful group of the Eildon Hills indicate at once a different composition and structure; they consist of felspathic porphyry, and form the nucleus of a circular area of that substance of no great dimensions. A similar formation is extensively developed in the Cheviot Hills, which, however, vary much in lithological structure, and in other respects, although all referable to the same class of rocks. The highest hills in the county—such as Chillhull, one of the Cheviots, Millenwood Fell, and Tudhope Hill—do not exceed 2000 feet: those in the interior are usually much lower,—Ruberslaw, 1174; Dunian, 1031; Eildons, 1634.

Even in the briefest outline of its geology it would be improper to omit mention of the remarkable greenstone dyke, from 12 to 20 or 30 feet in width, which runs across the county from east to west, nearly dividing it into two equal halves. It is a very remarkable geological phenomenon, from its great length as well as from its composition and other circumstances.

Both the greywacke and greenstone are occasionally employed as building-stones, for which neither of them is well adapted, especially the former, as, owing to its lines of cleavage, it is apt to open in rents after being placed in position, and admit moisture. Both these rocks make excellent road metal. The sandstones of the coal formation, and also the upper beds of the old red, afford admirable building materials, and are in general use throughout the county, although they have often to be conveyed for considerable distances.

One of the greatest inconveniences felt in the interior parts of the county is the distance from coal. It was formerly carted chiefly from Dumfriesshire and Northumberland; and the western parts of the county are still supplied in this way from the first-mentioned of these places. The greatest boon that was expected from the introduction of railway conveyance was the facilities it should afford for the transport of coal and lime. These advantages have been by no means hitherto realized to the extent anticipated, and good coal for domestic purposes is nearly as expensive as it was formerly. Limestone is plentiful in many places, but coal is often found too expensive for burning it. It used to be carted from various places near the English border, and still is to some extent; but the chief supplies both for agricultural and building purposes are now obtained from the Lothians by railway.

The climate cannot be said to present any very marked peculiarities. The mean annual temperature approximates to that of the kingdom at large, being, as determined by observations at Makerstoun on the Tweed, 46°·1. The mean annual quantity of rain, as registered at the same place, is found to be 24·18 inches. Were we in possession of a continuous series of hygrometrical observations, the results would no doubt present striking disparities in different places. The air is for a great part of the year extremely humid in the high grounds to the west, the evaporation from extensive grass lands, with a marshy bottom, being at all times considerable. In the low and arable portions of the county, on the contrary, the air is in general very dry, entire winters sometimes passing over with comparatively little rain. In former times corn crops in the uplands were frequently overtaken by the storms of winter before they could be housed; drainage, special manures, and, above all, the extensive use of lime, have produced a most beneficial change in this respect; and the crops come to maturity almost simultaneously in the upland districts and the haugh lands of the interior.

The agriculture of Roxburghshire has always borne a high character, and it may be safely affirmed that it has kept pace with the progress which every branch of husbandry has made of late years. Many of the better class of farmers are men of education and enlightened views, capable of appreciating modern improvements, and pos-

sessed of sufficient capital to carry them into full operation. The greater part of the arable lands have been adequately drained; the old implements have been supplanted by others of the most improved construction; special manures are in extensive use; and every means employed to bring the land into the highest state of cultivation. In most of the exposed situations belts of plantation have been reared, and additional shelter thus obtained for both cattle and crops. Subsoil-ploughing is frequently resorted to, and the grubber seems to be often substituted for the plough, as an easier and more efficient method of preparing the land, especially for turnip crops. The area of cultivated land has been greatly extended in many quarters; and while certain species of crop, such as flax, which once occupied a corner on almost every farm, have disappeared, others have been introduced, and are not unlike to come into more general favour. This seems to be the case more especially with mangold-wurzel; for the notion, that it is unsuited to our soil and climate, may now be regarded as erroneous, for certain early varieties have been cultivated with great advantage.

It is now rather more than a century since the drill culture of turnips was introduced into this county from Norfolk, and this description of crop is now reared to a vast extent. Indeed, no county in Scotland has such a breadth of land under turnips in proportion to its cultivated area; and in the amount of its gross produce it is exceeded only by three other counties. Guano, bone-dust, and most of the modern manures, are in general use for this crop; and it must be admitted that although it is indispensable in the economy of the farm, according to the present system of management, it is reared at a great and early-increasing expense. In this district the crop has always been particularly subject to the finger-and-toe disease, and of late years it seems to be rather on the increase. Now that the cause of this disease is known, it is understood why lime has so far a remedial effect; it is far, however, from being a complete preventive, and it is to be hoped that some more effectual one will be discovered.

The number of occupiers of land, according to the agricultural statistics of 1856, is 992, whose rents are at and above L.10. The total acreage under tillage is 126,113½, which is considerably less than one-third of the entire area. The kinds of crops, and the proportional extent of their cultivation, as well as the kinds and amount of stock, are as follows, omitting fractions:—

A considerable number of farms of mixed pasture land

Roxburgh-
shire.

and tillage are of great extent, amounting in some instances to 3000 acres; while farms of 1000 acres are not very rare. The average size of arable farms, however, may be stated at between 250 and 500 acres, and the rental varies of course with the qualities of the soil, distance from markets, and other circumstances. A great advance in rents has taken place of late years; few farms have been recently in the market which have not risen between 25 and 40 per cent. The Duke of Buccleuch's farms, which, from being usually given to tenants for political services, were very unequally rented and sometimes very low, have now been greatly raised; in some instances, it is believed, to double the original amount. Leases are generally of fifteen or nineteen years' duration; in regard to sheep farms, however, where expensive improvements yielding slow returns are less practicable, shorter periods are adopted: frequently it is nine years. The farm-steadings have been much improved of late, and some of those recently erected are not surpassed by any in the kingdom; the dwelling-houses are often handsome and commodious. These accommodations are of course provided by the landlord; but to this there is a partial exception in the case of the Buccleuch property, the management of which is in so many respects anomalous, the tenant being obliged to cart all the building materials, implying a considerable outlay in the present state of labour, and also to pay a percentage of £.3 on the money expended on the buildings. Rents are usually paid by a fixed sum, but in some instances grain rents are still partially in use.

The condition of farm-labourers is nearly on the same footing as in Berwickshire, to which article reference may accordingly be made for details. Hinds, however, are now better paid, receiving in all what is nearly equivalent to £.35 in money, with a free house and garden. The hind is under obligation to keep a bondager, or female worker for the farm, for whom he receives from the farmer 1s. a day for nine months, and 10d. a day for the three other months of the year; and both the hind and bondager receive a month's victuals during harvest. Wages for all kinds of servants and work-people have risen very high of late years. A man's wages for reaping is from 18s. a week to £.1; those of a female two or three shillings less. The smooth-edged hook, or sickle, is now very generally used, and it is thought that with this implement four good reapers will cut as much corn as six with the toothed hook; the latter, however, has the great advantage of arranging the corn more regularly in the sheaf. Scythes for cutting the grain crops are now pretty generally employed; and owing to the high price of manual labour, a strong desire is manifested to introduce reaping-machines. A few of these have been already in operation in the county; and that they are not more general is, we believe, owing chiefly to the fact that farmers are waiting in the expectation that the machine will soon undergo further improvements.

The towns are Kelso, Jedburgh, Hawick, and Melrose; and to the articles treating of these respectively reference must be made for an account of the different abbeys which give such an interest to most of them, of the ecclesiastical state, &c., and also of the manufactories which are concentrated in these places. Weekly markets are held in all the towns, as well as periodical fairs. That of Melrose has lately risen into great importance, and is now the principal market for lambs; Castleton in Liddesdale has also become important for its sheep markets; St Boswell's fair, which once possessed something of a national character, has now fallen off considerably; and from being a market for almost everything in ordinary use, is now chiefly confined to the sale of horses, cattle, sheep, and wool.

The county has now enjoyed for a considerable time the advantage of railway communication with the metropolis. The Hawick branch of the North British Railway enters

Roxburgh-
shire.

the county at Galashiels, and continues by Melrose, Newtown, Belses, and Hassendean, to the terminus at Wilton, which may now be said to form part of the town of Hawick. A branch leaves Newtown and joins the Berwick line at Kelso, thus opening up communication with the south; another branch connects the town of Jedburgh with this system. The want of a railway over the southern border, which might at once serve as a through line, and bring the coal and lime of England and Dumfriesshire into the interior of the county, has long been felt, and great exertions have recently been made to supply it. Two separate lines have been proposed for this purpose: one along the upper valley of the Teviot, by Langholm and Canonbie; the other running up the valley of the Slitrig, and continued by Riccarton, Newcastleton, and Longtown to the great southern line at Carlisle. After a struggle which has been scarcely equalled in the annals of railway partisanship, the last of these has been at length adopted; and the Border Union Railway has received the final sanction of the legislature while these pages are passing through the press.

The chief proprietors are the Dukes of Roxburgh and Buccleuch, Marquis of Lothian, Earl of Minto, Douglas of Cavers, Sir William Elliot, and various families of the name of Elliot, Ker, and Scott. Most of them have residences in the county. Of these, the most imposing is Fleurs, the residence of the Duke of Roxburgh, a palatial mansion standing on a beautiful terrace which overlooks the confluence of the Tweed and Teviot, and in the midst of a scene where most of the elements of a fine landscape are blended in rich profusion. Minto House is a very large modern mansion, without many architectural pretensions, surrounded with fine woods, and in the vicinity of the romantic Craigs, which are again crowned with their square tower, even more conspicuous than of old, adding an interesting feature to the landscape. The Lord Chancellor Campbell has built a considerable mansion at Hartrigg, which overlooks Jedburgh, and is the only residence of any note in that neighbourhood. But the whole valleys of the Tweed and Teviot are studded with handsome mansions; and the county can claim Abbotsford, although standing near its verge, which has long been an object of such general interest.

The county is divided into 34 parishes. The progress of the population will be seen from a comparison of the census returns at the four following decennial periods:—1821, 40,892; 1831, 43,663; 1841, 46,025; 1851, 51,642. There were in 1851 in all 67 places of worship, with 28,259 sittings, in the county. Of the former, 22 belonged to the Established Church, 14 to the Free Church, 15 to the United Presbyterians, 7 to the Independents, 3 each to the Episcopalians and Baptists, 2 to the Original Seceders, and 1 to the Roman Catholics. In the same year it contained 74 public and 32 private schools, attended by 7704 scholars. The valued rent in 1674 was £.314,663; and the annual value of real property, as assessed in 1843, £.264,321. The parliamentary constituency in 1854 was 1896, and there has been a decrease since.

There is scarcely any county in Scotland possessed of a more national interest than Roxburghshire. Lying on the verge of the two kingdoms, it has been the theatre of many a hard-fought field, and of many a scene of rapine and plunder during the endless wars that so long distracted the two kingdoms. The events that have transpired in it constitute a large share of border history, and that is so closely connected with the history of Scotland that we cannot here enter into any details. No part of the country presents so rich a field in the remains of feudal power and the means of national defence; even the seats of royalty are not wanting. It may be considered unrivalled in the relics of monastic magnificence, institutions which, however much we may despise them in the periods of their decay, were

Roxbury
||
Royal.

once the seats of learning, the fountains of knowledge, and the most powerful agents in the civilization of a barbarous people. The district teems with traditional stories and legends, many of which have been embodied in poetry, which has become a valuable part of our national literature. This county, therefore, has in former times always exercised great influence on the national character, whether considered in a political, religious, literary, or social point of view; and the number of celebrated men that have sprung from it in modern times, may be taken as a proof that it has not declined from its former character.

(J—S D—N.)

ROXBURY, a town of the United States of North America, Norfolk county, Massachusetts, forming a suburb of Boston, from which it is distant 3 miles to the S.W., and reached by four broad streets. The ground on which it stands is very varied in its nature, and some parts are so elevated as to command a fine view of the city. Most of the houses are well built, and surrounded by extensive gardens or shrubberies. Roxbury is the favourite residence of many Boston merchants. It has, however, branches of trade and manufactures proper to itself; the latter including steam and fire engines, iron castings, carpets, leather, &c. There are also here banks, insurance offices, and newspaper offices. The Forest Hill cemetery in this town is a large and well laid-out piece of ground. Roxbury was incorporated in 1630, the same year as Boston, but not chartered as a city till 1846. Pop. (1850) 18,273; (1853) about 22,000.

ROY, MAJOR-GENERAL WILLIAM, a famous geodesist, was employed in some of the great national trigonometrical measurements which were made during last century. In 1746 and 1747, while colonel of artillery, he surveyed and mapped out the whole mainland of Scotland. In 1784 he measured a base on Hounslow Heath, designed to be the germ of all subsequent scientific surveys of the United Kingdom. His aid was also employed in 1787 and 1788 in ascertaining, by observations from the above-mentioned base, the relative positions of the French and English royal observatories. He had completed this undertaking, and was just finishing an account of it for the *Philosophical Transactions* when he died in 1790. Besides several papers on his own operations in the *Philosophical Transactions*, General Roy is the author of a book entitled *The Military Antiquities of the Romans in North Britain, &c.*, London, 1793.

ROYAL (Fr. *royal*, Lat. *regalis*), belonging to a king. Thus we say royal family, royal assent, royal exchange, royal academy, &c.

Royal Family.—The first and most considerable branch of the king's royal family, regarded by the laws of England, is the queen.

1. The Queen of England is either queen-regent, queen-consort, or queen-dowager. The queen-regent, regnant, or sovereign, is she who holds the crown in her own right; as Queen Elizabeth, Queen Anne, and our present sovereign Queen Victoria. The queen consort is the wife of the reigning king; and she by virtue of her marriage is participant of divers prerogatives above other women. The husband of a queen regnant, as Prince George of Denmark was to Queen Anne, is her subject, and may be guilty of high treason against her; but in the instance of conjugal fidelity he is not subjected to the same penal restrictions. Hence, if a queen-consort is unfaithful to the royal bed, this may debase or bastardize the heirs to the crown; but no such danger can be consequent on the infidelity of the husband to a queen-regnant. A queen-dowager is the widow of the king, and as such enjoys most of the privileges belonging to her as queen-consort. But it is not high treason to conspire her death, or to violate her chastity; because the succession to the crown is not thereby endangered. Yet still, *pro dignitate regali*, no man can marry

a queen-dowager, without special license from the king, on pain of forfeiting his lands and goods.

2. The Prince of Wales, or heir-apparent to the crown, and also his royal consort, and the princess-royal or eldest daughter of the king, are likewise peculiarly regarded by the laws. For, by stat. 25 Edward III., to compass or conspire the death of the former, or to violate the chastity of either of the latter, is as much high treason as to conspire the death of the king or violate the chastity of the queen; and this upon the same reason as was before given, because the Prince of Wales is next in succession to the crown, and to violate his wife might taint the blood-royal with bastardy. And the eldest daughter of the king is also alone inheritable to the crown on failure of issue-male, and therefore more respected by the laws than any of her younger sisters; inasmuch that, upon this, united with other principles, whilst our military tenures were in force the king might levy an aid for marrying his eldest daughter, and her only. The heir-apparent to the crown is usually made Prince of Wales and Earl of Chester, by special creation and investiture; but, being the king's eldest son, he is by inheritance Duke of Cornwall without any new creation.

3. The rest of the royal family may be considered in two different lights, according to the different senses in which the term royal family is used. The larger sense includes all those who are by any possibility inheritable to the crown. Such, before the Revolution, were all the descendants of William the Conqueror, who had branched into an amazing extent by intermarriages with the ancient nobility. Since the Revolution and Act of Settlement it means the Protestant issue of the Princess Sophia, now comparatively few in number, but which in process of time may possibly be as largely diffused. The more confined sense includes only those who are in a certain degree of propinquity to the reigning prince, and to whom therefore the law pays an extraordinary regard and respect; but after that degree is past, they fall into the rank of ordinary subjects, and are seldom considered any further unless called to the succession upon failure of the nearer lines. For though collateral consanguinity is regarded indefinitely with respect to inheritance or succession, yet it is, and can only be, regarded within some certain limits in any other respect, by the natural constitution of things and the dictates of positive law.

By statute 12 Geo. III., c. 11, no descendant of the body of George II. other than the issue of princesses married into foreign families, is capable of contracting matrimony without the previous consent of the king signified under the great seal; and any marriage contracted without such a consent is void. It is provided, however, that such of the said descendants as are not above twenty-five, may, after a twelvemonth's notice given to the king's Privy Council, contract and solemnize marriage without the consent of the crown, unless both houses of Parliament shall, before the expiration of the said year, expressly declare their disapprobation of such intended marriage; and all persons solemnizing, assisting, or being present at any such prohibited marriage, shall incur the penalties of the statute of *præmunire*.

ROYAL OAK, a fair spreading tree at Boscobel, in the parish of Donnington in Staffordshire, the boughs of which were once covered with ivy, in the thick of which King Charles II. sat in the day-time with Colonel Careless, and in the night lodged in Boscobel House. They are mistaken who speak of it as an old hollow oak, it being then a gay flourishing tree, surrounded with many more. Its poor remains were fenced in with a handsome wall, with this inscription in gold letters: *Felicissimam arborem quam in asylum potentissimi regis Caroli II. Deus op. max. per quem reges regnant, hic crescere voluit.*

ROYER-COLLARD, PIERRE PAUL, a philosopher and statesman of France, who, by his noble character even

Royal Oak
||
Royer-Collard.

Royer-
Collard.

more than by his writings, merited the esteem of his contemporaries, over whom he exercised a great influence, was born on the 22d of June 1763, at Somepuis, near Vitry-le-Français. Having received his elementary education at a school of which his maternal uncle was the superior, he, at the age of twenty, became a member of the bar in Paris. On the breaking out of the Revolution he embraced the reform doctrines, and attached himself, with all the ardour of his nature, to the principles of that strange time. On the taking of the Bastille he was chosen a member of the first organized municipality, and he remained secretary to that body to the 10th of August 1792. Royer-Collard, with the quick sagacity of his nature, saw that no bounds were to be set to the rage of the predominant revolutionists, and he resolved, while there was yet time, to retrace his steps. He accordingly separated himself for ever from the fierce and fiery revolutionists, and joined the moderate monarchical party. In 1797, perceiving the absolute impossibility of establishing in France a republican form of government, he put himself in communication with the members of the royalist committee established in Paris. When Napoleon was elevated to the empire, the royalist agents disappeared, and Royer-Collard, renouncing politics, devoted himself entirely to the study of literature and philosophy. He meditated deeply on Pascal, Corneille, Bossuet, and Racine; he read and re-read La Bruyère, and he studied Milton without ceasing. Thucydides was the book of his old age, and Plato the book of his entire life. The *philosophes* of the eighteenth century, with their eternal cry about Sensationalism, and its competency to explain all human knowledge, he profoundly disbelieved; but as yet he saw no genuine guidance from that dreary desolation in which these *savans* would have immersed him. There chanced to meet his eye one day, on a bookseller's stall, a volume which he felt a strong desire to read. He bought the book, and went straight home to peruse the *Inquiry into the Human Mind on the Principles of Common Sense* of Dr Thomas Reid. Charmed with the sagacity of the Scottish philosopher, he procured his *Intellectual Powers*; and these, as well as his *Active Powers*, afforded him the food he was in search of. From that day Reid became a household word among the philosophers of France, and before many years Jouffroy presented the *Œuvres de Reid* to the French public. Kant, Descartes, Plato, and Schelling, the other philosophers to whom modern French eclecticism owes its origin, had not been as yet expounded to the French students by M. Cousin. Royer-Collard embraced, accordingly, the spiritualism of Reid, and with no very profound philosophical reading commenced in 1810 to expound him. "That distinguished philosopher [Royer-Collard]," says Sir William Hamilton, "has, however, placed too great a reliance upon the accuracy of Reid." (Reid's *Works*, p. 262.) He had been appointed professor of history and of philosophy at the normal school; and in 1813 he delivered a remarkable discourse upon philosophical studies, which was destined to be his last. The events of 1814 came to carry off this earnest philosopher from his admiring pupils of the normal school. The following year he was chosen deputy of the Marne, was made a councillor of state, director of the library, and president of the commission of public instruction. In these various departments he reformed abuses, introduced important changes and ameliorations; and so popular had he become, that in 1827 no fewer than seven colleges chose him at once as their deputy. The same year he was admitted a member of the French Academy in the room of the great geometer Laplace. He led the discussion on the constitution in the Chamber of Peers in 1831; and after the triumph of the coalition in 1839 he finally retired from public life. Royer-Collard, after spending an honourable career both as a philosopher and as a statesman, died at Châteaueux, near

Royle
||
Rubens.

Saint-Aignan, on the 2d September 1845, in his eighty-second year. His philosophical papers will be found published in his *Fragments*.

ROYLE, JOHN FORBES, a distinguished botanist, was born in the year 1799, and was educated for the medical profession at London under Dr Anthony Todd Thomson. Entering the service of the East India Company, he applied himself to the study of the botany of Hindustan. For this object the superintendentship of the botanic gardens at Saharunpore afforded him many facilities. The greatest diligence was employed in making a collection of plants. Their medicinal properties especially were investigated. Other natural products were likewise examined by his all-observant eye. The result of all these labours were published on his return to England in a work entitled *Illustrations of the Botany and other Branches of the Natural History of the Himalaya Mountains*. The rest of Dr Royle's life after his settlement in London was characterised by great and multifarious activity. He discharged till 1856 the professorship of materia medica in King's College. A *Manual of Materia Medica* and other separate works were published by him. Several papers from his pen were contributed to the *Penny Cyclopædia* and to Kitto's *Dictionary of the Bible*. Above all, it was his great aim to bring the natural history of Hindustan before the public. He published a work *On the Productive Resources of India* in 1840, and another *On the Fibrous Plants of India* in 1855. He read before the British Association papers *On the Cultivation of Cotton*, *On the Cultivation of Tea in the East Indies*, and on other kindred subjects. He also took an active part in arranging the Indian department in the Great Exhibition of 1851. Dr Royle, at the time of his death, on January 2, 1858, was a fellow of the Royal Linnæan and Geological societies.

ROYSTON, a market-town of England, on the borders of Cambridgeshire and Hertfordshire, in a bleak country, in the midst of downs, 13 miles S.S.W. of Cambridge. It has a fine modern market-house, a church that once belonged to a priory of St Augustine, places of worship for Independents and Unitarians, several schools of various kinds, and a mechanics' institute, provided with a library. Beneath the market-house was discovered in 1742 a curious old cavern, cut out in the chalk of the district, in the shape of a bell, and curiously carved. Malting, brewing, &c., form the occupations of the inhabitants; and there is some trade in corn. Pop. (1851) 2061.

ROYTON, a village of England, Lancashire, in a deep valley, 2 miles N. of Oldham. The streets are regular and the houses well built, so as to have given the place of late years much of the aspect of a town. It has a chapel belonging to the Established Church, places of worship for Independents, Methodists, and Quakers; as well as a national school. Cotton and flannel are made here; and the coal-pits and quarries in the vicinity employ many of the inhabitants. Pop. 6974.

RSHEV-WLADIMIROV, a town of European Russia, capital of a circle in the government of Twer, on the Volga, 74 miles W.S.W. of Twer. It is well built, and contains many churches, schools, and benevolent institutions. Gardening, ship-building, and harness-making are carried on here; and there is an active trade in the produce of the surrounding country. Pop. (1855) 16,139.

RUBBER, INDIA. See CAOUTCHOUC.

RUBENS, SIR PETER PAUL, the most distinguished painter of the Flemish school, was the fourth son and sixth child of John Rubens, a lawyer of some celebrity, and Maria Pypelincx, and was born at Siegen on the 29th of June 1577. As this was the festival of St Peter and St Paul, the parents agreed that their infant son should bear the name of those illustrious saints. The family re-settled at Cologne the next year after the birth of Peter Paul,

Rubens. where they afterwards resided until the death of his father, which occurred on the 18th of March 1587. On the following year his mother, after an exile of twenty years from her hereditary abode, resolved to return to Antwerp, which had in 1585, after a twelvemonth's siege, surrendered to the dominion of Spain. The future painter, who was now ten years of age, probably left Cologne with some boyish regrets; for in speaking of it afterwards in a letter dated 15th July 1637, he says,—“I have a great affection for the city of Cologne, where I was brought up until I was ten years of age.” Rubens commenced his studies with ardour on reaching Antwerp, and seems to have prosecuted them with very marked success. His mother placed him with the Countess of Lalaing as page; but this was much too frivolous an occupation for Peter Paul, and, returning to his mother very shortly after, beseeched her to allow him to become a painter. As the boy had displayed great quickness in the acquisition of knowledge, and particularly in the department of languages, his mother and guardians had destined him to follow the profession of his father. He had certainly displayed quite an uncommon talent for drawing, however; and this peculiar gift, combined with his earnest solicitations, and also with the melancholy fact, that the family fortune had been very much reduced by the late wars, induced his mother, although it must have been somewhat galling to the maternal pride, to place young Rubens, then in his thirteenth year, with Tobias Verhaeght, or more correctly Van Hæght, a skilful landscape-painter, where he might acquire the rudiments of his art. He remained but a short time with his first master, and subsequently joined the historical painter Adam Van Noort, or Oort, as notorious for his dissolute life as he was distinguished for his exquisite colouring. Rubens suffered his vulgar habits and churlish disposition for a considerable time; but human patience gave way at last, and he was compelled to leave him. He now, in his nineteenth year, had recourse to Otto Van Veen, usually known as Otto Venius, “the Flemish Raphael,” then court painter to the Infanta Isabella and her husband the Archduke Albert. Here Rubens, for the first time, found all that he most desired. His master was a man of gentle and polished manners, very willing, and thoroughly capable of giving instructions both in the scientific knowledge and in the minor details of the painter's art. The progress of Rubens during this period was quite unexampled; and in 1600, when he had hardly completed his twenty-third year, Venius advised him to proceed to Italy, and generously presented him to the Archduke Albert and the Infanta, who furnished him with letters of recommendation to smooth his way to that land of art. He had already executed (Descamps, *Les Vies des Peintres*, i., p. 323) several pictures of considerable value; among others, the “Adoration of the Three Kings,” a “Holy Trinity,” and a “Dead Christ.”

On the 9th of May 1600 Rubens set out for Italy, and made Venice his first halting-place. Here he studied and copied the works of Titian, Paul Veronese, and other eminent masters who were likely to assist him in the cultivation of his decided faculty for colour. While busily occupied with these engagements, he became known to Vincenzo II. de Gonzaga, Duke of Mantua, a distinguished patron of literature and the fine arts, who, upon his presenting his letters of recommendation from the archduke, appointed him gentleman of the chamber and court painter. This distinction was precisely what Rubens needed, for it afforded him leisure to study the immense collection of art treasures in Mantua, where the spirited and beautiful compositions of Giulio Romano, and the severe dignity of Andrea Mantegna, seem particularly to have delighted him. Returning from Rome, whither he had gone upon a short visit, he was employed by the Duke of Mantua in 1605 upon a political mission to Philip III. of Spain. It is

obvious that Rubens, besides possessing splendid talents as a painter, must have likewise displayed no ordinary degree of culture, combined with wonderful politeness of manners and refinement of address, ere he could have gained the entire confidence and good-will of the Duke Vincenzo. But Rubens was a man of genius, and, as Sir Dudley Carlton styled him in 1618, he was “the prince of painters and of gentlemen.” Very handsome and dignified in his person, with a fine complexion, glossy brown hair, eyes of “a golden embrownment,” that beamed with a softened fire, a captivating manner, and an agreeable voice; with a sound and clear intellect, with a splendid imagination that much study had enriched and controlled, with a fine turn for humour, and with the most complete self-command,—is it to be wondered at that he almost enchanted those with whom he came in contact? and is it strange that the Duke Vincenzo was among the number? Nor did his mission to Madrid belie the duke's sagacity. He was received with all the grace accorded to an ambassador, and with all the interest attendant on a splendid artist. He painted portraits of the king, many of the Spanish nobles, besides numerous historical pieces. His mission fulfilled, he returned again to Mantua, and persuaded the duke to allow him again to visit Rome. While in the Eternal City he copied the principal paintings of the great masters, and executed three pictures for his former patron the Archduke Albert, designed to adorn the church of Santa Croce della Gerusalemme. In the beginning of the year 1607 he left Rome, and proceeded first to Milan and afterwards to Genoa, where his fame having preceded him, he was received in the most princely manner by the nobles and first men of the city. The beauty of the place, the mildness of the climate, and the great courtesy of the inhabitants, induced him to prolong his stay. Here he painted two of his best works for the church of the Jesuits, besides making numerous drawings and plans of the pompous palaces and fantastic buildings of the city, a collection which he subsequently engraved at Antwerp, and published under the title of *Palazzi antichi di Genova, raccolti e designati da Pietro Paolo Rubens*, 1622, 2 vols. large folio, with 139 copperplates.

Rubens was interrupted in his interesting studies in the month of November 1608 by the alarming intelligence of his mother's serious illness. He hastened to Antwerp, but before he arrived she was dead. Overwhelmed with grief, he withdrew to the abbey of St Michael, and there he remained for four months in the deepest seclusion, pouring out his woes upon his canvas, with nothing to console him but his pencil and a few choice books. Strange that this man, who had just captivated courts by the splendour of his presence, and won their admiration by the dazzling qualities of his genius, should here, on the death of a woman of seventy, immerse himself within the walls of an abbey, and spend four weary months in quite unavailing tears. We must recollect that this aged person was his own mother, dearer to him than all else the world knew, and that Rubens carried the qualities of genius in his heart as well as in his head. That genius is always saturated with the moral nature of a man is no less true than that the moral nature of Rubens was superlatively fine. After raising a tomb to the memory of his mother, he resolved to set out for Mantua; but the Archduke Albert would not hear of his leaving Flanders. He was sent for to attend upon the court at Brussels, received a pension, and was made court painter. He was accordingly persuaded to remain in his native land; and to avoid the distractions of a court in the prosecution of his high designs, he asked permission to choose Antwerp as his place of residence, a request that was readily granted him. He accordingly settled down in that ancient city; and on the 13th of October 1609 he was married, in the abbey church

Rubens.

Rubens. of St Michael, to Isabella Brant, daughter of a magistrate of Antwerp. By this wife Rubens had two children: Albert and Nicolas, to the former of whom the Archduke stood sponsor, and gave him his own name. As a still further promotion of his comfort and happiness, he, in 1610, built a princely house after the Italian style, from designs of his own, and adorned its walls with those priceless works of the great masters which he had collected in Italy. Rubens, who was exceedingly regular and temperate in his habits, had great powers of application. As he prosecuted his art he had always a person employed to read to him from some favourite classical author. The writers which delighted him most were Livy, Plutarch, Cicero, and Seneca. His excellent acquaintance with the Latin, besides other modern languages, must have been of singular advantage to him. All the towns of the Netherlands, all the cities of Italy, rivalled each other in their eagerness to possess pictures from the pencil of this rising Flemish master. Envy, that invariable shadow of greatness, projected its sombre outline occasionally over the figure of Rubens; but, turning on it with his gay humour and merry laugh, it swiftly slunk off to the halls of Orcus and old Night. It was about this time that, solicited by an English alchemist, named Brendel, for money to aid him in his pursuit of the philosopher's stone,—“You are come,” said Rubens, taking him into his study, “twenty years too late; for it was then with this palette and these brushes that I found the philosopher's stone.” It would have been well for Vandyck if he had listened to this advice, who allowed himself to be robbed of a great part of his fortune by these silly projects of the gold-seeker.

One of the first compositions of Rubens on his settling at Antwerp was an altar-piece for the private chapel of the archduke, representing “A Holy Family;” and art-critics are agreed that of all his pictures of this class, this “Holy Family” bears away the palm. It was so much admired that the members of the fraternity of St Ildefonso had an altar-piece painted by Rubens for the chapel of the order of St James on the Caudenberg, near Brussels, which was one of the most admirable paintings that ever came from his hands. As a fine specimen of the strongly-marked outlines, glowing colouring, and careful execution with which he handled portraits at this period, there is the celebrated picture in the Munich gallery representing himself and his wife. The free, brilliant, and fantastic style of his later years is hardly at all perceptible in this admirable picture. Such works as “The Descent from the Cross,” executed for the Antwerp Arquebussiers as an indemnification for a threatened lawsuit, raised the painter's reputation to the very highest pitch; and Marie de Medicis, the widowed queen of France, wishing to adorn the Luxemburg palace, chose Rubens, in preference to all other artists of his day, to perform this great undertaking. He executed twenty-one compositions for this Luxemburg gallery, besides a series of portraits in his own studio at Antwerp. In this great enterprise he received material aid from his pupils and assistants, many of whom subsequently rose to eminence in their profession. The most celebrated among his pupils were Vandyck, David Teniers, and Jacob Jordaens; and the most distinguished of his assistants, who usually painted backgrounds, animals, and other accessories, were Snyders, Wildens, and Van Uden. This work completed, probably with too great haste (for the taste of some of the representations is very questionable, and disagreeably Flemish), the queen and her court at Paris testified their high approbation. Rubens, having made the acquaintance of the Duke of Buckingham at Paris, that nobleman bought from him the whole of his collection of works of art for the sum of 100,000 florins, or L.10,000. On the 29th of September 1626 Rubens lost his wife; and to divert his mind from this heavy

Rubens. domestic affliction he undertook a journey to Holland, and visited all the painters of note under the guidance of young Joachim Sandiart.

In 1627 Rubens laid aside his brush and palette for a time, and engaged in a delicate political mission to the court of Spain in behalf of his country. His stay at Madrid being somewhat protracted, he found leisure to execute several excellent pictures. It was on occasion of this visit to the Spanish capital that Rubens made the acquaintance of the youthful Velasquez, with whom he had previously corresponded. It was this “Spanish Vandyck” who escorted Rubens through the art treasures of the Escorial, and with whom, during his stay in Spain, the great Fleming spent many happy hours. Philip IV. of Spain made him secretary to the Privy Council, an office which in 1630 was granted in reversion to his son Albert by letters-patent, and he returned to Brussels with entire success. He had not long been in the Netherlands when occasion was found in 1629 for another diplomatic mission to the English court. Rubens set out as the herald of peace from the courts of Spain and Flanders, and on his arrival in London received a most gracious reception from Charles I. His splendid artistic genius, his cultivated intellect, his refined manners, all contributed to win the regard and admiration of the king. Meanwhile, he painted an allegory of the blessings of peace and war, a “St George and the Dragon,” and an “Assumption of the Virgin” which he presented to the king. He was likewise commissioned to paint the allegorical history of James I. for the banqueting-hall, Whitehall, an engagement which he executed on his return to Antwerp, completed them in 1634, and sent them to England in 1635. (Sainsbury's *Rubens*, p. 184.) He likewise received the honorary distinction of M.A. from the university of Cambridge in the month of September 1629. The tedious negotiations with Cottington being brought to a close, the ambassador prepared for taking leave. Before doing so, however, the king, to mark the distinguished opinion which he entertained of the great artist, had him knighted in Whitehall, presented him with the royal sword, and attaching the regal portrait to a rich gold chain, suspended it round the neck of Sir Peter Paul Rubens. Thus loaded with honours, the ambassador sailed away, and returning probably by way of Madrid (see Sainsbury's *Original Papers relating to Rubens*, London, 1859), where he had renewed favours heaped upon him, he presented himself to the Infanta Isabella at Brussels, who gave him a most gracious reception. On the 6th of December 1630, Rubens, then in his fifty-fourth year, married Helena Forman or Fourment, his niece, a girl of sixteen, and possessed, according to all accounts, of remarkable beauty. Her portrait, which served him frequently as a model, is found in many of his historical pieces. Returning to Antwerp in 1631, Rubens again resumed his favourite occupation with renewed vigour. He was made director of the School of Art there, and on his installation presented the academy with a beautiful picture of the “Virgin with the infant Jesus and Joseph.” The studio of Rubens now presented a most animated scene. The most considerable princes of Europe vied with each other in obtaining works from the hand of the great Fleming; and in order to gratify these crowned heads, he contented himself with merely superintending the execution of his pictures, and by putting the finishing touches to the whole. This circumstance must materially detract from the individuality of those paintings, however it may have astonished the recipients of them at the time. His artistic occupations were again interrupted in 1633 by another diplomatic embassy to Holland. The treaty of peace was suddenly cut short by the death of his patron, the Infanta Isabella, in 1633, who had survived her husband upwards of ten years. In 1635 the busy hand of the painter, that for long

Rubinsk
||
Ruddiman.

years had seldom been stayed, was now destined to receive a severe check, reminding him in the most emphatic manner that he must take in his canvas and prepare for the coming storm. He was attacked by fits of the gout, which frequently assailing his hands, rendered him quite incapable of lifting his brush. He now confined himself to small landscapes, many of which he finished at his country residence at Stein, near Mechlin. He lingered on for the next five years, the fits of his disorder becoming more frequent and violent, till, in the beginning of 1640, he fell a victim to this torturing malady in the sixty-third year of his age. Thus was lost to the world, not at a very mature age, one of the very greatest men whom it had known. "Rubens," says Smith in his *Catalogue Raisonné of the Works of Eminent Painters*, "possessed a more universal genius, a more extensive knowledge of all the principles of the art, and a greater power in the practice of them, than any other painter who has hitherto existed." (For a critical estimate of the paintings of Rubens, the reader is referred to the articles ARTS, *Fine*; and PAINTING. See also *Original Papers relating to Rubens*, by Sainsbury, London 1859; Waagen's *Life of Rubens*, 1840; Michel, *Histoire de la Vie de P. P. Rubens*, 1854; Michiels, *Rubens et l'Ecole d'Anvers*, 1854.) (J. D.—S.)

RUBINSK, or RYBINSK, a town of European Russia, capital of a circle of the same name, in the government and 52 miles W.N.W. of Jaroslav, at the confluence of the Rubinska with the Volga. It is one of the chief river-ports in the empire, and the great central point of the inland trade of Russia: the great canals which unite the waters of the Baltic, the White, and the Caspian seas join in its vicinity. It has two cathedrals, besides five other churches, several schools and benevolent institutions, a good stone quay, and seven bridges. There is a large market-place, where an annual market is held for a fortnight in June and July. There are linen factories, spinning-mills, tanneries, and other establishments. Grain is here the staple of commerce. Goods are transferred at Rubinsk from the larger to the smaller vessels that navigate the Volga, or *vice versa*. Pop. (1855) 8751.

RUBRIC (Lat. *ruber*, red), in the canon law, signifies a title or article in certain ancient law-books, and which was so called because written, as the rules and regulations in the ancient liturgies are, in red letters.

RUBY. See MINERALOGY.

RUDDER. See SHIP-BUILDING.

RUDDIMAN, THOMAS, one of the most eminent grammarians which Scotland has produced, was the son of a farmer, and was born in October 1674 at Raggel, in the parish of Boyndie and county of Banff. Ruddiman was instructed in the principles of Latin grammar at the parish school of Boyndie, where he made astonishing progress. The first book which charmed the opening mind of Ruddiman was Ovid's *Metamorphoses*; nor did he cease to relish the beauties of this author when his judgment was mature, for during the rest of his life Ovid was his favourite poet. At the age of sixteen he became anxious to pursue his studies at the university; but his father, thinking him too young, opposed his inclination. Hearing of the competition trial which was annually held at King's College, Aberdeen, for a certain number of bursaries on the foundation of that university, Ruddiman's ambition was kindled. Without the knowledge of his father, and with only a single guinea in his pocket, which his sister had privately given him, he set out for that place. On the road he was met by a company of gipsies, who robbed him of his coat, his shoes, his stockings, and his guinea. But this misfortune did not damp his enterprising spirit. He continued his journey to Aberdeen, presented himself before the professors as a candidate, and, though he had neither clothes to give him a decent appearance nor friends to recommend him, he gained

the first prize. After attending the university for four years, Ruddiman, he obtained the degree of Master of Arts, an honour of which he was always proud.

Ruddiman was soon after engaged as a tutor to the son of Mr Robert Young of Auldbar, the great-grandson of Sir Peter Young, who under the direction of Buchanan had been preceptor of James VI. His income here must have been very small, or his situation unpleasant, for within a year he accepted the office of schoolmaster in the parish of Laurencekirk. When Ruddiman had spent three years and a half in this employment, the celebrated Dr Pitcairne happening to pass through Laurencekirk, was detained in that village by a violent storm. Pitcairne wanting amusement, inquired at the hostess if she could procure any agreeable companion to bear him company at dinner. She replied that the schoolmaster, though young, was said to be learned, and, though modest, she was sure he could talk. Pitcairne was delighted with the conversation and learning of his new companion, invited him to Edinburgh, and promised him his patronage.

When Ruddiman arrived in Edinburgh he was appointed assistant-keeper of the Advocate's Library under Mr Spottiswoode, the principal librarian. His salary for executing this laborious office was L.8, 6s. 8d. He managed to eke out this small allowance by giving private lessons in Latin, and by preparing the *Introductio* of Sir Robert Sibbald, and Sir Robert Spottiswoode's *Præctiques*, for the press. In 1707 he commenced auctioneer, an employment not very suitable to the dignified character of a man of letters. But to this occupation he was probably impelled by necessity. Ruddiman had a family, and seems to have been a stranger to that foolish pride which has seduced some literary men into the opinion, that it is more honourable to starve than have recourse to an occupation which men of rank and opulence are accustomed to despise. The same year he published an edition of *Voluseni de Animi Tranquillitate Dialogus*, to which he prefixed the life of Volusenus. Volusenus or Wilson was a learned Scotchman, and had the honour to be patronized by Cardinal Wolsey. In 1709 he published *Johnstoni Cantici Solomonis Paraphrasis Poetica*, and *Johnstoni Cantica* with notes, which he dedicated in verse to his friend and patron Dr Pitcairne. The philological talents of Ruddiman were next directed to a more important object, in which they became more conspicuous and useful. Freebairne the bookseller proposed to publish a new edition of the Scottish translation of Virgil's *Aeneid* by Gawin Douglas, Bishop of Dunkeld. Of the contributions which some eminent characters of the age presented, the most valuable were supplied by Ruddiman. He corrected the work and wrote the glossary; and there is strong reason to believe that he was the author of the forty-two general rules for assisting the reader to understand the language of Douglas. To those who wish to be acquainted with the ancient language of this island the glossary will be a treasure, as it forms a compendious dictionary of the Anglo-Saxon. The reputation of Ruddiman had now extended to a distance. He was invited by the magistrates of Dundee to be rector of the grammar-school of that town; but the faculty of advocates, anxious to retain him, augmented his salary to L.30, 6s. 8d. sterling, and he declined the offer. In 1711 he assisted Bishop Sage in publishing Drummond of Hawthornden's works, and performed the same favour to Dr Abercrombie, who was then preparing for the press his *Martial Achievements*. In 1713 he was deprived of his friend Dr Pitcairne. On this occasion he testified all the respect which friendship could inspire to the memory of his deceased patron and his surviving family. He composed Pitcairne's epitaph, and conducted the sale of his library, which was disposed of to Peter the Great of Russia.

In 1714 the *Rudiments of the Latin Tongue* were pub-

Ruddiman. lished. Eighteen or nineteen Latin grammars, composed by Scotchmen, had appeared before this period; yet such is the intrinsic value of this little treatise that it soon superseded all other books on the subject. It has also been translated into various other languages. He was next called upon to publish the works of Buchanan. The value of these he enhanced by an elaborate preface, his *Tabula Regum Scotiæ Chronologica*, and *Proprium Nominum Interpretatio*. Ruddiman also added a learned dissertation, entitled *De Metris Buchananæis Libellus*, and subjoined annotations, critical and political, on the history of Scotland. As he espoused the cause of Queen Mary, he raised against himself a host of enemies. He had now been so long accustomed to superintend the press that he was led to form the plan of erecting a printing-office himself. Accordingly, in the year 1715 he commenced printer, in partnership with his brother Walter, who had been regularly bred to the business; and some years afterwards he was appointed printer to the university, along with James Davidson, bookseller. The first literary society formed in Scotland was instituted in the year 1718. Ruddiman and the masters of the High School had the honour to be the founders of it. They were afterwards joined by Lord Kames.

In 1725 was published the first part of his *Grammaticæ Latinæ Institutiones*, which treated of etymology. The second part, which explained the nature and principles of syntax, appeared in 1731. Of this work he published an abridgment, to which he subjoined an extract on prosody.

Ruddiman next engaged in the management of a newspaper, an employment for which his genius and industry seemed to render him well qualified. But those who should expect either much information or amusement from this publication would perhaps be greatly disappointed. The newspaper which he conducted was the *Caledonian Mercury*, and was established in 1720 by William Rolland, a lawyer. This paper continued in the family of Ruddiman till the year 1772, when it was sold by the trustees of his grandchildren. After the death of Spottiswoode, Ruddiman was appointed keeper of the Advocate's Library, though without any increase of salary. On the 1st of October 1735 it appeared, from an exact statement of his affairs, that he was worth L.1882, 5s. 2d. sterling; and on the 20th of May the ensuing year his wealth had increased to L.1985, 6s. 3d. sterling. In 1710 he had valued his effects at L.24, 14s. 9d. sterling. In 1739 he published *Selectus Diplomatum et Numismatum Scotiæ Thesaurus*. This work was projected and begun by Anderson, and hence called Anderson's *Diplomata*, but was finished by Ruddiman. The preface, which is an excellent commentary on Anderson's performance, was written by Ruddiman, and displays a greater extent of knowledge than any of his other productions. He retired to the country during the summer of 1745; and whilst his fellow-citizens were spilling each other's blood, he was more happily engaged in writing *Critical Observations on Burmann's Commentaries on Lucan's Pharsalia*.

During the last seventeen years of his life Ruddiman was almost incessantly engaged in controversy. To this he was in some measure compelled by the violent attacks which some critics of the times had successively made upon his works. He died at Edinburgh on the 19th of January 1757, in the eighty-third year of his age, and was buried in the Greyfriars churchyard, without any monument to distinguish his grave. He was three times married, but left behind him only one daughter, Alison, who was married in 1747 to Mr James Stewart. He is supposed to have died worth L.3000 sterling.

He was of the middle size, of a thin and straight make, and had eyes remarkably piercing. Of his talents and learning his works afford the most satisfactory proofs. His memory was tenacious and exact; and he was so great a

master in the Latin language that he has been equalled by none since the days of Buchanan. Ruddiman has left a character unstained by vice, and distinguished by many virtues.

RUDING, ROGERS, a great authority on the national coinage, was born in Leicestershire in 1751, and was educated for the church at Merton College, Oxford. After settling down in 1793 as vicar of Maldon and Chessington in Surrey, he became engrossed with antiquarian researches. In the course of these studies his attention was particularly directed to the subject of the coinage. He saw its imperfections and its evils, and he resolved to try if he could bring about a remedy. His first attempt was a work published in 1798, and entitled *A Proposal for restoring the Ancient Constitution of the Mint so far as relates to the expense of Coinage; together with a Plan for the Improvement of Money, and for increasing the difficulty of Counterfeiting*. This was followed up by the commencement of a more thorough effort. All his antiquarian lore and power of investigation were employed to lay bare the abuse, from its origin to its latest development. In an accurate and minute survey, he showed how the imperfections of the coinage arose and were continued, how it became easy to counterfeit, how vain were the severest penalties enacted against forgery, and how that crime might be prevented by counteracting and weakening the temptation. The book was completed and published in 1817, in 4 volumes, 4to, under the name of *Annals of the Coinage of Britain and its Dependencies, from the earliest period of authentic history to the end of the fiftieth year of his present Majesty King George III.* A second edition was soon afterwards issued, comprising a continuation of the history down to the year 1818. Ruding, at his death in 1820, was a fellow of the Society of Antiquaries. He had also been a contributor on the subject of coins to the *Gentleman's Magazine*.

RUDOLSTADT, the capital of the principality of Schwartzburg-Rudolstadt, in a valley on the left bank of the Saale, 16 miles S. of Weimar. The castle of Heideksburg, where the prince resides, occupies the summit of a hill, about 200 feet above the river, and contains some good paintings and plaster casts. In the town are a theatre, a museum of natural history, and several benevolent and other establishments. Pop. 4000.

RUE, CHARLES DE LA, a French orator and poet, was born at Paris in the year 1643. He was educated at the college of the Jesuits, where he afterwards became professor of humanity and rhetoric. At an early age his talent for poetry disclosed itself. In 1667, when he was only twenty-four years old, he composed a Latin poem on the conquests of Louis XIV.; which was so much esteemed by Corneille that he translated it into French, presented it to the king, and at the same time passed so high encomiums on the superior merit of the original that the author was received into the favour of that monarch, and ever after treated by him with singular respect. De la Rue, anxious to preach the gospel to the Canadians, requested leave of absence from his superiors; but having destined him for the pulpit, they refused to comply with his request. Accordingly he commenced preacher, and became one of the most eminent orators of his age. In his discourses he would probably have been too lavish of his wit if he had not been cautioned against it by a judicious courtier. "Continue," said the courtier, "to preach as you do. We will hear you with pleasure as long as you reason with us; but avoid wit. We value the wit contained in two verses of a song more than all that is contained in most of the sermons in Lent." De la Rue died at Paris on the 27th of May 1725, at the advanced age of eighty-two. He was one of those who published editions of the classics for the use of the Dauphin. Virgil, which fell to his share, was published, with notes and a Life of the poet, in 1675, 4to, and is a valuable and useful edition.

Rueil
Rufinus.

RUEIL, or RUEL, a town of France, in the department of Seine-et-Oise, on the Seine, at the foot of a vine-covered hill, called Mont Valerien, 4 miles N.E. of Versailles. It has a fine church, adorned with a portico and belfry, and containing the remains of Hortense, once queen of Holland, beside those of her mother, the Empress Josephine, whose favourite residence, Malmaison, stands near Rueil. Pop. 4581.

RUFFO, FABRIZIO, a famous soldier-cardinal, was born of a noble family at Naples in 1744, and was educated for the church. He gained a reputation at Rome as treasurer of the pontifical chamber, and as a cardinal. He was also well known in his native country as a courtier in 1798 when King Ferdinand I. fled to Sicily from before his republican subjects and the French. But his greatest fame was achieved in the following year, when he undertook to win back the kingdom of Naples to his sovereign. Landing at Bagnara, a fief of his family, he raised the royal standard. His hereditary influence in the district excited a favourable feeling towards him. The dignity he held in the church, and the large rewards he promised, completed the effect. As he advanced through Calabria, he received recruits from every village and town. "The army of the Holy Faith" (as he called it) swelled until it became resistless in its march. Some cities were driven to yield through very terror. Others were taken by storm and pitilessly given over to rapine and slaughter. His enterprise, thus victoriously commenced, was soon facilitated by several favourable circumstances. Bands of English, Turks, and Russians, continued to augment his troops. The republicans were kept engaged by other royalist leaders. The French forces also were called to the north of Italy by pressing emergencies. Accordingly, he was enabled to march to the very walls of Naples without opposition. Nor did his good fortune forsake him there. An insurrection in favour of him arose within the town; the republican party surrendered to him; and on the 30th of June 1799 King Ferdinand I. arrived in the bay on board of one of Nelson's ships. Cardinal Ruffo died at Naples in 1827.

RUFINUS, commonly called *Toranus*, was born about the middle of the fourth century, probably at Concordia, a town near the head of the Adriatic. At first he applied himself to the belles lettres, and particularly to the study of eloquence. To accomplish himself in this elegant art, he removed to Aquileia, a town at that time so celebrated that it was called a second Rome. Having made himself acquainted with the polite literature of the age, he withdrew into a monastery, where he devoted himself to the study of theology. Whilst thus occupied, Jerome happened to pass through Aquileia. Rufinus formed an intimate friendship with him; but, to his inexpressible grief, he was soon deprived of the company of his new friend, who continued his travels through France and Germany, and then set out for the East. Accordingly, he embarked for Egypt in the train of Melania, a devout Roman matron; and having visited the hermits who inhabit the deserts of that country, he repaired to Alexandria to hear the renowned Didymus. The sanctity of his manners soon obtained the confidence of Melania, which continued without interruption during their residence in the East, a period of nearly thirty years. The Arians, who swayed the ecclesiastical sceptre in the reign of Valens, persecuted Rufinus with great cruelty. They threw him into a dungeon, loaded him with fetters, and, after almost starving him to death, banished him to the deserts of Palestine. But from this exile he was relieved by the pecuniary aid of Melania, who employed her wealth in ransoming those confessors who had been condemned to prison or banishment. Jerome, supposing that Rufinus would immediately proceed to Jerusalem, wrote to one of his friends there congratulating him on the prospect of so illustrious a visitor. To Jerusalem he accord-

ingly proceeded, and having built a monastery on the Mount of Olives, he there assembled a great number of hermits, whom he animated to virtue by his exhortations. He converted many to the Christian faith, and persuaded more than four hundred hermits who had taken part in the schism of Antioch to return to the church. He also prevailed on many Macedonians and Arians to renounce their errors.

Rugby.

His attachment to the opinions of Origen set him at variance with Jerome, who, being of a temper peculiarly irritable, not only retracted all the praises which he had lavished upon him, but loaded him with severe reproaches. Their disputes, which were carried to a very indecent height, tended to injure Christianity in the eyes of the weak. Theophilus, their mutual friend, settled their differences; but the reconciliation was of short continuance. Rufinus having embarked for Italy along with Melania, and having published a translation of the principles of Origen at Rome, was summoned to appear before Pope Anastasius. He made a specious apology for not appearing, and sent a vindication of his work, in which he attempted to prove that certain errors of which Origen had been accused were perfectly consistent with the opinions of the orthodox. Jerome attacked Rufinus's translation. Rufinus composed an eloquent reply, in which he declared that he was only the translator of Origen, and did not consider himself bound to sanction all his errors. He subsequently retired to Aquileia; but in 408 A.D. he again returned to Pinetum in Italy. Most ecclesiastical historians say that Rufinus was excommunicated by Pope Anastasius; but for this no good evidence has been adduced. From Pinetum, being threatened by Alaic, he retired to Sicily, where he died in 410 A.D. Rufinus has left seven original compositions and ten translations from the Greek, while a number of his writings have been lost. (For further information respecting Rufinus, the reader may consult the elaborate work of Fontanini, Rome, 1742; and the more recent dissertation of Marzuttini, Patav. 1835.)

RUGBY, a market-town of England, in the county of Warwick, stands on a hill on the left bank of the Avon, 16 miles N.E. of Warwick and 83 N.W. of London. Part of the town is old, and part recently erected; the former somewhat irregular, and the latter consisting of straight streets lined with good brick houses. The parish church is an old building with a massive square tower. There was at one time a castle in the vicinity, but only a few traces of it are now to be seen. The chief importance of the place is derived from its being the seat of one of the great English public schools. This institution was founded in 1567 by Lawrence Sheriff, a London tradesman and native of Rugby. Its reputation as a place of education dates from the act of Parliament regulating it, passed in 1777, and was raised to a still higher degree under Dr Arnold, who, while head-master (1827-1842), effected great improvements in Rugby school, which were subsequently adopted in most of the other schools of England. The amount of the endowment is estimated at L.5000 a year, and the number of pupils averages 400. There are thirteen assistants under the head-master, and twenty-one exhibitions to the universities, each of L.60 for seven years. The buildings are of brick, in the Elizabethan style, and form a quadrangle 90 feet by 75. In the chapel are monuments to Dr Arnold and other celebrated masters of the school. The town contains, besides the parish church, two other Established churches; also places of worship belonging to Wesleyans, Baptists, and Roman Catholics; parish and infant schools, various benevolent institutions, &c. Many of the inhabitants are employed in an iron foundry, the only manufactory of any importance. The trade is considerable, and several fairs are held for corn and cattle. Rugby is the place of junction of several

lines of railway, and thus occupies an important position in the system of internal communication of the country. The London and North-Western connects it on the one hand with the metropolis, and on the other with Liverpool, Manchester, and the north; while other lines diverge from this point in different directions. A county court is held in the town. Pop. 6317.

RUGELEY, or RUDGELEY, a market-town of England, in the county of Stafford, on the Trent, 7 miles N.W. of Lichfield and 123 N.W. of London. It is irregularly laid out; but the streets are clean, and the houses generally neat and well built. The parish church still retains a tower and chancel of considerable antiquity, but was almost entirely re-built in 1822. The chancel is now used as a school-room. The other churches in the town belong to Independents and Roman Catholics. For education there are here a grammar school, endowed, national, infant, and other schools. The manufactures comprise hardware, ropes, hats, agricultural implements, &c. Coal-pits are worked in the neighbourhood; and several fairs are held in the town. Pop. 3054.

RÜGEN, the largest island of Germany, lies in the Baltic and forms part of the Prussian monarchy, being included in the province of Pomerania. It is separated from the mainland by a narrow channel varying from half a mile to 2 miles in breadth, and has an area of 388 square miles. Its outline is very irregular; and as it is penetrated on all sides with arms of the sea, it has the appearance of several peninsulas joined together. Unlike the low coasts of the neighbouring mainland, those of this island are, except in the west, formed by steep chalk cliffs, and the whole bears a considerable resemblance to the Isle of Wight. The surface is varied with hill and dale, luxuriant woods and wild ravines, and the scenery is very beautiful and romantic. Many visitors resort hither in summer on account of the beauty of the island and its advantages for sea-bathing. The soil is fertile and well cultivated; cattle are reared in great numbers; and the fisheries are very productive. In the peninsula of Jasmund, on the eastern side of the island, stands a large beech forest called the Stubbenitz, which contains an oval lake, supposed to have been sacred in heathen times to Hertha, the goddess of the earth and patron deity of Rügen. There are also many sepulchral mounds of large size in the island. Rügen was originally independent of all the surrounding countries, under princes of its own; but in 1169 it was conquered by the Danish king Waldemar I., who made these princes his vassals, and on the extinction of their line gave Rügen as a fief to the dukes of Pomerania. By the peace of Westphalia it was ceded to Sweden, but in 1815 it was transferred to Prussia. Pop. (1852) 43,525.

RÜGENWALDE, a town of Prussia, province of Pomerania, in the circle and 20 miles N.N.E. of Coslin, on the right bank of the Wepper, not far above its mouth. It is pretty well built, and has a castle, several churches, public offices, and courts of law. The principal manufactures are sail-cloth, damask, linen and woollen fabrics; bleaching and ship-building are also carried on. Rugenwalde is resorted to as a watering-place, and is noted for its smoked salmon and eels, in which a considerable trade is carried on. Pop. 5067.

RUHNKEN, DAVID, a classical critic of great eminence, was born at Stolpe, in Prussian Pomerania, in the year 1723. Of the early part of his studies little is known, but it appears that he was some time at Schlaff, from which he removed to Königsberg, where he met with the celebrated philosopher Kant. He afterwards repaired to Göttingen, to attend the lectures of Gesner, and to enlarge his knowledge of the Greek language. Some time after this period he formed an acquaintance with Ritter and Berger, whilst he resided at Wittenberg, where he continued about two

years. His earliest production was a disputation *De Galla Placidia Augusta* (1743), daughter of Theodosius, and the sister of Arcadius and Honorius. Under Berger he studied Roman antiquities and eloquence; under Ritter, jurisprudence and history. He relinquished the study of divinity, for which he was at first designed, and prevailed with his parents to allow him to transfer his residence to Leyden, where he arrived with recommendations to many of the learned. He pursued his studies with avidity and zeal, and accompanied Alberti in his visit to the Spa in the year 1750. Hemsterhuis wishing to attach him to Holland, urged him to persevere in the study of the law, as affording an additional chance of employment. This advice he thought proper to follow, and published a translation of some works of Theodorus, Stephanus, and other Greek civilians. In the year 1755 he went to Paris, where Capponier, who was at that time keeper of the king's library, received him kindly. He now formed an acquaintance with Dr Musgrave and Mr Tyrwhitt, who were there for the purpose of examining the manuscripts of Euripides. He had also formed the resolution of going to Spain; but Hemsterhuis recalled him, as he needed his assistance as lecturer in the Greek tongue. In 1755 Ruhnken took possession of his office, and read an excellent discourse *De Græcia Artium et Doctrinarum Inventrice*. He was likewise useful to Ernesti in his edition of Callimachus; and in 1761 he succeeded Oudendorp as professor of history and of eloquence, delivering an inaugural oration *De Doctore Umbratico*. About a year after this event Ruhnken was offered the chair of Gesner in the university of Göttingen. This offer he, however, declined; but, on his recommendation, the office was very worthily bestowed upon Heyne. In 1764 he married a beautiful Italian lady, who about six years afterwards lost both her speech and sight by a stroke of apoplexy. She had two daughters, one of whom was afterwards blind. The desire of Ruhnken to do Ernesti a favour made him turn his attention to the *Memorabilia* of Xenophon; and he was led to examine with particular attention the treatise of Longinus on the Sublime. Hemsterhuis died in 1767, and Ruhnken, then rector of the university, delivered a noble eulogium on his friend and patron. It was subsequently published under the title of *Elogium Tiberii Hemsterhusii*, 1768. In 1772 he prosecuted his new edition of Velleius Paterculus, and prepared a second edition of his *Epistola Critica*, and a collection of scholia on Plato. In the year 1768, he published a valuable tract *De Vita et Scriptis Longini*, in the form of an academical dissertation, to which he prefixed the name of one of his pupils. His Velleius Paterculus appeared in 1779, and in 1780 Homer's reputed hymn to Ceres. In 1786 he published the first part of Apuleius, which had been prepared by Oudendorp, and a new edition of his own *Trimaüs* in 1789; and at the same time he collected and published the works of Muretus, in 5 vols. 8vo. Both the body and mind of Ruhnken were much weakened by domestic affliction; but he was in some measure relieved by the satisfaction he felt at the dedication of Homer by Wolf, although he was not of that writer's opinion, that the works of Homer were written by different authors. He sunk into a kind of stupor on the 14th of May 1798, which in two days put a period to his existence.

His knowledge and learning were immense, and he was unquestionably one of the very greatest scholars of the eighteenth century. He was lively, cheerful, and gay, even to an extreme. Many posthumous honours were conferred upon him, and a pension settled on his unfortunate widow. When Wyttenbach took possession of Ruhnken's chair, he delivered a discourse on the early age of Ruhnken, which he proposed as an example to the Batavian youth who made the belles lettres their study; and he afterwards wrote a Life of his master, Leyden,

Rūlsk
||
Rumili.

1799. Ruhnken published an edition of his *Discourses and Essays*, in 2 vols., in 1797, which were subsequently edited by Bergmann in 1823. His *Epistolæ* to Valckenauer and others have been published at various periods.

RŪLSK, or RYLSK, a town of European Russia, in the government of Kursk, on the Sem, 65 miles W. of Kursk. It has five churches, several schools, a charitable institution, some manufactures, and a considerable trade in vegetables and fruit, which are raised in the vicinity. Pop. (1855) 7070.

RUM. See DISTILLATION.

RUM, an island of Scotland, one of the inner Hebrides, belonging to the county of Inverness, and lying to the S.W. of Mull; N. Lat. (of the western extremity) 57. 2., W. Long. 6. 25. Its form is somewhat irregular: greatest length, 8 miles; breadth, $7\frac{1}{2}$; circumference, about 20. The surface is more rugged and mountainous than that of any other of the Hebrides, there are hardly any valleys, and few patches of verdure among the hills. In the centre are a few fresh-water lakes, abounding in trout. A very small part of its surface is cultivated. Pop. (1851) 162.

RUMFORD, COUNT. See SIXTH DISSERTATION.

RUMILI, or RUMELIA, a name that has been applied at different periods, in a varying and sometimes vague manner, to various portions of the Turkish empire. The term, which signifies the land of the Romans, seems to have been originally applied by the Ottomans to the territories which they conquered from the Eastern Empire. For this reason, Asia Minor is generally known in the east under the name of Rum. But the term Rumili has always been used to designate some portion more or less extensive of European Turkey. In its widest application it denotes the whole country from the Danube and Save on the N., to the Ægean Sea and Greek frontiers on the S., and from the Black Sea on the E., to the Adriatic on the W., thus including the countries generally known as Bulgaria, Thrace, Macedonia, Thessaly, Albania, Bosnia, and Servia. It is, however, frequently used in a more limited sense, for the southern portion only of this vast region corresponding very nearly to the ancient Thrace, Macedonia, and Thessaly. But in neither of these senses is Rumili a political division, as the Turkish empire is now divided into eyalets totally irrespective of the ancient divisions of the country, or of those commonly used by European geographers. The present eyalet of Rumili is composed of the northern portion of Albania, and the western of Macedonia. It is bounded on the N. by Montenegro and the eyalet of Bosnia, E. by those of Uskiub and Saloniki, S. by that of Janina, and W. by the Adriatic. Its extent and limits, however, like those of all the Turkish divisions, are by no means fixed, but liable to frequent changes. The area of Rumili, along with the adjacent eyalet of Uskiub, is 18,883 square miles, and the population in 1844 was 2,700,000. It is subdivided into four livas, and the capital is Monastir. This is the Turkish eyalet of Rumili; but in speaking of the Ottoman empire, Europeans generally follow the larger and more historical divisions of the country; and of these Rumelia is one of the most important. It comprises, as has been already mentioned, the ancient countries of Thrace, Macedonia, and Thessaly. It is bounded on the N. by Bulgaria, from which it is separated by the Balkan Mountains; on the E. by the Black Sea; S. by the Sea of Marmora, the Ægean, and Greece; and W. by Albania. It is traversed by several offshoots of the Balkan range, between which there are valleys and plains of much beauty and fertility. The principal rivers are the Maritza, ancient *Hebrus*; the Struma, ancient *Strymon*; the Wardar, ancient *Axius*; and the Vistritza, ancient *Haliacmon*, all flowing into the Ægean, the former two from the Balkan range, and the latter from that of Pindus, which separates Rumelia from Albania. The climate is mild and healthy; and the prin-

cipal products are wine, oil, tobacco, and cotton. There are many sheep raised here, which have excellent wool. The cotton is generally woven, and dyed of a red colour. This region forms the Turkish eyalets of Edinê, or Adrianople and Saloniki, with parts of Rumili and Janina.

RUNCIMAN, ALEXANDER, a Scottish painter, was the son of an architect, and was born in Edinburgh in 1736. The enthusiasm of his artistic genius was very great. While a mere child, he went into the fields to sketch rocks and trees. At the age of fourteen he sat down to devote himself entirely to study under John Norry, an artist of local celebrity. In his nineteenth year, he appeared before the world as a landscape-painter by profession. Nor after the public had persisted during five years in neglecting his pieces did his self-confidence fail him. It then appeared to him that his proper province was in the higher field of historical painting. A trial of six years only tended to confirm this notion. Nothing was wanting to perfect him in high art, he thought, but a residence in Italy. He therefore spent five years in Rome, and came back in 1771 with a spasmodic style, and with a courage equal to the loftiest subjects. The remaining part of Runciman's career was as energetic as the former. Appointed professor in the trustees' academy immediately after his return, he applied himself to the task with a superabundant display of zeal. His attention was also constantly engrossed with the most ambitious designs. Among other efforts, he undertook to embellish the hall of his patron, Sir James Clerk of Pennycuik, with twelve paintings from Ossian. With visions before him of making a miniature Sistine chapel, and of rivalling Michael Angelo, he set himself to work. His application grew so intense and so constant that his health was irretrievably injured. Accordingly, after the completion of the hall he became gradually weak, and on the 21st of October 1785 dropped down dead at the door of his lodgings. (Cunningham's *Lives of British Painters*, &c.)

RUNCORN, a market-town of England, Cheshire, on the left bank of the Mersey, near its confluence with the Weaver, 17 miles N.N.E. of Chester, and 182 N.W. of London. It is an ancient town; but until the formation of the Duke of Bridgewater's canal, which terminates here, it was of very little importance. The public buildings include the new town-hall, a handsome edifice, containing also a news-room; the jail; the parish church, also of modern date; and Trinity church, a red sandstone building, with a square tower. There are also places of worship for Independents, Baptists, Methodists, and Roman Catholics; and several schools of various kinds. The manufactures of the place are pretty numerous, including iron, ropes, sails, soap, &c.; and there are also ship-building yards, slate and stone quarries, and establishments for distilling turpentine. The trade of the place, too, is great and rapidly increasing; the town is a free port, and contains a custom-house, and ample accommodation for goods in warehouses and yards. The principal exports are stone and salt. Runcorn is much resorted to in summer for the sake of sea-bathing. Markets are held weekly, and fairs twice a year. Pop. (1851) 8049.

RUNES. See ALPHABET.

RUNGPOOR, a district of British India, in the presidency of Bengal, lying between N. Lat. 25.16. and 26 21., E. Long. 88. 26. and 89. 50.; bounded on the N. by Cooch Behar, E. by the districts of Goalpara and Mymensing, S. by that of Bograh, and W. by that of Dinajepore: length, from S.E. to N.W., 106 miles; breadth, 60; area, 4030 square miles. The most part of the surface is low, sloping gradually from N.W. to S.E. to the bank of the Brahmapootra, which flows along the eastern frontier of the district. Many other rivers and watercourses of smaller size intersect the country; and in the rainy season a great part of it is laid under water. There are no considerable

Runciman
||
Rungpoor.

Runjeet
Singh
||
Rupert.

lakes; but many small sheets of stagnant water called *jhus*. The climate differs in some respects from that of those parts of India which lie farther S. and W. The hot winds of spring are unknown in many parts of the district, and of short duration in the rest; the earlier part of the summer is tempered by cool breezes from the E., and it is not till June that extreme heat begins to set in. In the winter hoar-frosts occur at some places. The soil produces rice, wheat, barley, pulse, &c., as well as indigo and tobacco. Cotton has not been successfully raised here. The principal branch of industry is the preparation of indigo, for which there are 50 large factories, conducted upon European methods, besides about 350 of inferior size. The commerce is not very active. Indigo is the chief article of export; besides this, silk, tobacco, sugar, carpets, &c., are exported; and the imports include cotton, woollen, and silk fabrics, salt, metals, &c. The country which now forms the district of Rungpoor seems to have belonged originally to the ancient Hindu states of Camroop, which at the close of the fifteenth century was conquered by the kingdom of Bengal, and this in its turn fell under the sway of the emperors of Delhi. It came into the possession of Great Britain in 1765, by a grant from the Emperor Shah Alum. The capital is an insignificant town of the same name, consisting of a large mosque surrounded by a crowd of wretched huts. Pop. of the district, 2,559,000.

RUNJEET SINGH, the founder of the Sikh empire, was the son of Maha Singh, the chief of a Sikh tribe, and was born about 1780. The early part of his career was not propitious. His father died when he was only in his twelfth year. His worthless mother, bent upon retaining the government of the clan in her own hands, tried to make him an imbecile. Accordingly the means of education were denied him, and every indulgence that could enervate and debase his mind was forced upon his acceptance. But the boy grew up possessed of very dangerous accomplishments. No sooner had he reached his seventeenth year, than he removed his mother by assassination, and took the power into his own hands. He then commenced a long-continued and successful system of aggression. Every influence—war, stratagem, negotiation, and deceit—was brought into play. The countenance of the English East India Company was gained. No means were spared to inveigle or force the other Sikh chiefs into a confession of his supremacy. His power was especially directed against the inert Affghans. Adopting European arms and discipline, he invaded them with an irresistible host. The province of Cashmere was taken in 1819. Other conquests followed; and at length, in 1826, he reduced the province of Peshawur. Runjeet Singh having thus founded an empire, died in 1839. His political Life has been written by H. T. Pringle.

RUPEE, a silver coin current in many parts of Asia, and of values ranging from one shilling and sixpence to nearly two shillings.

RUPERT, PRINCE ROBERT, of Bavaria, was born in 1619. His father, Frederic V., elector palatine, had rendered himself an exile by an unsuccessful attempt to seize upon the crown of Bohemia, which entailed upon his son the reverses of his own evil fortune. His mother was Elizabeth, eldest daughter of James I. of England, and by his connection with the British throne the youth resolved to win his way to fame, and perhaps to fortune. Of a restless, active disposition, that had little known the restraints of any regular system of educational discipline, he already had his eye fixed upon the civil wars that were then desolating England, and with a thirst for the fortunes of the soldier, he sought and obtained the command of a regiment of cavalry from his uncle Charles I. of England. He took Hereford, Lichfield, and Cirencester, and shared in the battles of Worcester, Edgehill, and Chalgrove Field. In

Ruppin.

these engagements he had given proof of much rash courage and of daring impetuosity, but he was found to be destitute of the prudence of the soldier, and was entirely wanting in military sagacity. The king, pleased probably with his rashness, which he trusted to time to bring into subjection to his will, created him a Knight of the Garter and made him Duke of Cumberland. He took Bristol, scattered the parliamentary forces at Newark; but at Long Marston Moor, Oliver Cromwell and his Ironsides compelled him ignominiously to flee. Prince Rupert did not lose confidence by this defeat, nor did the king's reliance on him diminish. He was made general of all the king's troops: he took Leicester: he swept down upon the Ironsides at Naseby; but his rashness, as usual, proved his ruin. He hastened to Bristol to prepare that city to resist an attack, but betrayed such an entire want of strategical skill, and gave such proofs of pusillanimity, that not only was the place taken by the triumphant enemy, but Charles I., having lost all patience with his favourite, stripped him of his command and deprived him of his countenance. But Prince Rupert being a needy man, of great versatility and very adventurous, resolved to try his fortune upon the sea, seeing she had deserted him by land. He accordingly obtained command of the fleet in 1648, but had Blake out upon him before many months, who pursued him to Kinsale, to Lisbon, to Carthage, until, Rupert having sunk and captured some English merchantmen at Malaga, the little admiral burnt and destroyed almost his whole fleet, and compelled him to take refuge with two or three ships in the West Indies, where he for some time supported himself by piracy. Returning across the Atlantic, he took refuge in a French port, sold his ships to the French government, and went for a time at large throughout France. On the restoration of Charles II. he again sought the English court, and having now blustered out his youthful impetuosity, he was again appointed to a command under the Duke of York. In 1673 he was entrusted with the command of the fleet, but found it so ill equipped and so weakly manned that he chose to return home rather than face the enemy in such a condition. Prince Rupert had now completed the active part of his life. As governor of Windsor, he occupied his leisure, according to the fashion of the times, with painting and engraving, with mechanical and chemical experiments. He attained to some distinction in the engraver's art, and is generally supposed to have been the inventor of mezzotinto. This is, however, a mistake, as the invention belongs to a German named Siegen, who, having fallen upon the art in the year 1642, showed it to Prince Rupert, whom he met at Brussels in 1655 or 1656. (Laborde's *Histoire de la Gravure en Manière Noire*.) He died at Spring Gardens on the 29th of November 1682, and was interred with great magnificence in Henry VII.'s chapel, Westminster.

Prince Rupert is believed to be the inventor of pinchbeck or prince's metal, and of those curious glass bubbles known as "Rupert's drops" (see ANNEALING), which, as Lord Macaulay remarks, "have long amused children and puzzled philosophers."

RUPPIN, New, a town of Prussia, in the province of Brandenburg, on the W. shore of a lake of the same name, 37 miles N.W. of Berlin. It is surrounded by walls, and well built, with regular streets and several public squares; and it contains a column with a statue of Frederick the Great. The principal establishments in the town are a church, school, lunatic asylum, and two hospitals. Linen and cotton cloth are the most important articles manufactured. The trade is considerable, and is facilitated by a canal, which forms part of the line of communication between the Elbe and the Oder. Ruppin was for some time the residence of Frederick the Great, when crown prince. Pop. 9780.

Rush.

RUSH, BENJAMIN, a celebrated American physician, born on the 5th January 1745, near Bristol in Pennsylvania, was descended from a family who were originally Quakers, and who had accompanied Penn in 1683 to his infant colony. He lost his father at an early age, and having been first placed by his mother at a school kept by the Rev. S. Finley, he proceeded to finish his classical education at the college of Princeton, and there took the degree of Bachelor of Arts before he was sixteen. He then determined to make the profession of physic the pursuit of his life, and went to study it, first under the care of Dr Redman of Philadelphia, and then at Edinburgh, where he was created a doctor of physic in 1768. At the time of his return from Europe, a new school of medicine was about to be founded in Philadelphia, and he became professor of chemistry immediately upon his arrival. In 1776 Dr Rush began to take an active part, with the rest of his countrymen, in the political struggle of the day, and he was chosen a member of Congress for the state of Pennsylvania; in 1777 he was appointed surgeon-general to the army, and not long afterwards became physician-general. He also contributed his best efforts to the improvement of the internal government of the state which he represented. But he soon withdrew his attention from political affairs, in order to devote it exclusively to medical and literary subjects; and he continued to be actively engaged in the practice of physic for the remainder of his life. In 1776 he married Miss Julia Stockton of New Jersey. He had by her thirteen children, nine of whom survived him in respectability and prosperity. In 1791, when the two medical colleges of Philadelphia were incorporated into a single university, he was appointed professor of the institutes of medicine, and of clinical practice. In 1793 he greatly distinguished himself by the new and apparently successful modes of practice that he introduced in the epidemic yellow fever, which was then causing great mortality throughout the United States, and which, shortly before his death, he was induced to believe not contagious, but derived from some general causes independently of the previous existence of the disease. He died on the 13th of April 1813, after an illness of five days, of a typhus fever, with some pulmonary symptoms. He had for a considerable part of his life been threatened with consumption, but had combated its attacks with unusual success. The number of his writings is considerable in proportion to their bulk; the times and the state of society in which he lived being such as to produce rather hasty and spirited than highly-finished compositions.

His inaugural dissertation was entitled *De Concoctione ciborum in ventriculo*, and contained an explanation of the opinions relating to digestion, which he had learned from Dr Cullen, Edinburgh, 1768; *Account of the Effects of the Stramonium*, *American Phil. Trans.* i. 1770; *On the Utility of Wort in ill-conditioned Ulcers*, *Med. Obs. Inq.* iv. 1770, addressed to Dr Huxley; *Inquiry into the Natural History of Medicine amongst the Indians of North America*, an anniversary oration delivered in 1774; *Remarks on Bilious Fevers*, addressed to Dr Huxley, *Med. Obs. Inq.* v.; *Account of the Influence of the Revolution on the Human Body, with Observations on the Diseases of Military Hospitals*; *Inquiry into the Cause of the Increase of Bilious and Intermitting Fevers in Pennsylvania*, *American Trans.* ii.; *Observations on Tetanus*; *Inquiry into the Influence of Physical Causes upon the Moral Faculty*; *Remarks on the Ardent Spirits upon the Body and Mind*; *Inquiry into the Causes and Cure of Pulmonary Consumption*, in his *Medical Inquiries and Observations*, i., Phil. 1788. His grand object in the cure of consumption is to recommend exercise, and everything which will enable the patient to take exercise; anticipating a practice which has become somewhat fashionable in England of late years, from its frequent success as a temporary palliative. The subject is continued in the second volume of the *Inquiries*, published in 1793; and bleeding is very strongly recommended in the earlier and only curable stages. Consumption, he observes, is common in America, though scrofula scarcely ever occurs; and it has sometimes been known to be clearly communicated by infection to the Negroes belonging to a family, who had, of course, no consanguinity that could account

for a similarity of constitution. Five volumes, in the whole of this collection, appeared from 1788 to 1798; a second edition was published in 1804, in four volumes 8vo; a third in 1805, revised and enlarged, with a continuation of the *Histories of the Yellow Fever* from 1793 to 1809; *A Defence of Blood-letting as a Remedy for Certain Diseases*; *A View of the State of Medicine in Philadelphia*; *An Inquiry into the Sources of the Usual Forms of Summer and Autumnal Diseases in the United States*; and the recantation of his opinion of the contagious nature of the yellow fever, already mentioned; *Information to Europeans disposed to Emigrate to the United States, in a Letter to a Friend*; *Observations on the Population of Pennsylvania*; *Observations on Tobacco*; *A new Mode of Inoculating Small-Pox, a Lecture*, reprinted, Phil. 1792, 8vo; *Essay on the Study of the Latin and Greek Languages*, *American Museum*; condemning it as a waste of time, oppressive to the poor dunces who are tortured into their parts of speech, to the great scandal of a humane and republican country, and subversive of a proper respect for the rights of boys, and, consequently, for the rights of man. *Essays, Literary, Moral, and Philosophical*, 1798, 8vo; containing a republication of the last article, together with the author's eulogiums on Dr Cullen and on Professor Rittenhouse, delivered in 1790 and 1796, and with some other miscellaneous papers of less moment, 1806; *Lectures on the Cause of Animal Life*, 1791; *Account of the Sugar-Maple Tree*, *American Trans.* iii. 1791; *Observations on the Black Colour of the Negro*, *American Trans.* iv., 1792, attributing the blackness to leprosy; *History of the Yellow Fever*, 1794. This celebrated work has been translated into French and Spanish. At the time of its publication an almost superstitious dread was entertained by medical men of the use of the lancet in idiopathic fever; and few books have ever had so powerful and extensive an effect in altering the general treatment of a disease as this history had produced in every part of the world. Probably, indeed, it may have carried a number of the younger and bolder practitioners into an opposite extreme; but, with respect to the author's claims to merit on the occasion, it must be allowed that the innovation showed an uncommon combination of courage with talent and good sense; and the accurate description of the disease that he has given us fully establishes his claim to the character of an accurate nosologist. *On the Symptoms and Cure of Dropsy, and especially of Water in the Head*, 1793; *An Account of the Influenza of Philadelphia in 1789, 1790, 1791*; *Observations on the State of the Body and Mind in Old Age*, 1794; *Observations on the Nature and Cure of Gout and Hydrophobia*, 1797; *Inquiry into the Cause and Cure of the Cholera Infantum*, 1797; *Observations on Cynanche Trachealis*, 1797; *Introductory Lectures*, 1801, Ed. ii. 1811, with ten new introductory lectures, and two lectures on the *Pleasures of the Senses and of the Mind*. In 1809 he published the works of Sydenham and of Clegghorn, with Notes, and in 1810 those of Pringle and Hilary. *On Diseases of the Mind*, 8vo, 1812—an elaborate work which had long been impatiently expected; *A Letter on Hydrophobia*, 1813, addressed to Dr Hosack, and containing additional reasons for believing the seat of the disease to be chiefly in the blood-vessels, an opinion which in all probability has at least tended to shorten the sufferings of several individuals on whom the experiment of profuse depletion has been tried. Dr Rush's numerous publications obtained him many marks of respect from his contemporaries, and procured him admission, as an honorary member, into the most distinguished literary and philosophical societies of Europe. His name was familiar to the medical world as the Sydenham of America. His accurate observations and correct discrimination of epidemic diseases well entitled him to this distinction, while in the original energy of his reasoning, he far excelled his prototype. His literary and professional character, indeed, appears to have been greatly influenced by the moral and political sentiments which were prevalent in his day. A love of innovation led him to that proud defiance of established authority which is just as likely to be pernicious as to be salutary. The study of the learned languages he depreciated, in one of his early essays, as unfit for a republican education; and this was the first step to the true Jacobin doctrine, that it was unrepugnant and aristocratical to have received any education whatever. In physic, his rejection of the prejudices of antiquity was somewhat more consistent with moderation, and the reform that he attempted was occasionally more successful than his literary speculations; nor can it be denied that there are a multitude of original suggestions in his works which may very probably be found capable of affording valuable hints to the lovers of medical experiments.

(Hosack and Francis in the *American Med. Philos. Register*; Chalmers's *Biographical Dict.*, xxv., London, 1816, 8vo.) (T.X.)

RUSH, a seaport and market town of Ireland, on a headland stretching into the Irish Sea, in the county and 14 miles N.E. of Dublin. The chief buildings are the Ro-

Rush.

Rushworth. man Catholic chapel, and a martello tower which defends the harbour. Kenure Park, a fine mansion near the town, was once the seat of the Duke of Ormond. Rush harbour has recently been improved, and is capable of receiving vessels of 50 tons burden. Some trade and fishery is carried on here. Pop. 1496.

RUSHWORTH, JOHN, the compiler of some very useful historical collections, was born in Northumberland about the year 1607, being descended of honourable ancestors. After attending the university of Oxford for some time, he removed to Lincoln's Inn; but the study of the law not suiting his genius, he soon deserted it, in order to seek a situation where he might more easily gratify his love for political information. He frequently attended the meetings of Parliament, and wrote down the speeches both of the king and members. During the space of eleven years from 1630 to 1640, when no Parliament was held, he was an attentive observer of the great transactions of state in the Star Chamber, the court of honour, and exchequer chamber, when all the judges of England assembled there on cases of great emergency. Nor did he neglect to observe with a watchful eye those events which happened at a distance from the capital. He visited the camp at Berwick, and was present at the battle of Newburn, at the treaty of Ripon, and at the great council of York. In 1640 he was appointed assistant to Henry Elsyng, clerk to the House of Commons, and thus had the best opportunities of being acquainted with their debates and proceedings. The Commons considered him as a person worthy of confidence; and, in particular, they trusted him with carrying their messages to the king whilst he remained at York. When the Parliament created Sir Thomas Fairfax their general, Rushworth was appointed his secretary, and discharged the office much to the advantage of his master. When Fairfax resigned his commission, his secretary returned to Lincoln's Inn, and was soon afterwards (in 1651-52) chosen one of the committee that was appointed to deliberate concerning the propriety and means of altering or new-modelling the common law. He was elected one of the representatives for Berwick-upon-Tweed to the Parliament which Richard Cromwell assembled in 1658, and was re-elected by the same town to the Parliament which restored Charles II. to the crown. After the Restoration, he delivered to the king several books of the Privy Council, which he had preserved in his own possession during the commotions which then agitated the country. Sir Orlando Bridgeman, keeper of the great seal, chose him his secretary in the year 1677, an office which he enjoyed as long as Sir Orlando kept the seals. In 1678 he was a third time chosen member for Berwick, and a fourth time in the ensuing Parliament in 1679. He was also a member of the Parliament which was convened at Oxford. The different offices he had held afforded him favourable opportunities of acquiring a fortune, or at least an independence; yet, whether from negligence or prodigality, he was never possessed of wealth. Having run himself into debt, he was arrested and committed to the King's Bench prison, Southwark, where he lingered for the last six years of his life in the most deplorable condition. His memory and judgment were much impaired, partly by age and partly by the too frequent use of spiritous liquors. He died on the 12th of May 1690.

His *Historical Collections of Private Passages in State, Weighty Matters in Law, and remarkable Proceedings in Parliament*, were published in folio at different times. The first part, comprehending the years between 1618 and 1629, appeared in 1659. The copy had been entrusted by Oliver Cromwell to Whitelock, with instructions to peruse and examine it. Upon perusing it, he thought it necessary to make some alterations and additions. The second part was published in 1680; the third in 1692;

the fourth and last, which comes down to the year 1648, was published in 1701; and altogether they made seven volumes. These underwent a second edition in 1721; and the trial of the Earl of Strafford was added, which made the eighth. This work has been much applauded by those who condemn the conduct of Charles I., and accused of partiality by those who favour the cause of that unhappy monarch. Rushworth's principles indeed led him to show the king and his adherents in an unfavourable light, and to vindicate the proceedings of Parliament; yet it cannot justly be affirmed that he has misrepresented or falsified any of the speeches or facts which he has admitted into his collection.

RUSSELL, WILLIAM, Lord, a distinguished English patriot, was descended from a family which had held land in Dorsetshire from a very early period, was the third son of William, Earl of Bedford, and was born on the 29th of September 1639. He entered Cambridge about 1654, afterwards resided with his elder brother at Augsburg, and spent the winter of 1658 at Paris. On his return to England, he was chosen member of Parliament for Tavistock. The court, which was at that time the abode of gaiety and licentiousness, seems at first to have attracted his attention, and, according to Bishop Burnet, "drew him into some irregularities." An earnest and truthful nature like Russell's soon shook itself rid of the entanglements of court life; and in 1669 he married Rachel Wrothesly, second daughter of the Earl of Southampton, and widow of Lord Vaughan. To the influence of this most excellent woman, who seems to have been endowed with all the charms which captivate and all the virtues which elevate man's nature, we must attribute not a few of the noble qualities which adorn the memory of her husband. Had the government of the country been conducted with security and honour, Lord William Russell would have continued to enjoy the happiness of private life in the company of this admirable woman; but, roused by the hypocrisy and scandalized by the open and shameless venality of Charles II. and his brother the Duke of York to restore the Roman Catholic religion, no Englishman who had any regard for the independence, the freedom, and the religion of his country, could any longer keep aloof. He accordingly, with no very remarkable talents, ranged himself at once on the side of the Protestants, and became the declared opponent of the king. "I never knew," says Burnet, "any man have so entire credit with the nation as he had;" and again, the bishop continues, "his understanding was not defective; but his virtues were so eminent that they would have more than balanced real defects, if any had been found in the other." Lord Russell joined Lord Cavendish, Sir W. Coventry, Colonel Birch, Mr Powle, and Mr Littleton, in their endeavours to thwart the scandalous proceedings of the king, and advancing as they did, and as they required to do, at first with moderation, gained so great an influence in the country, that the king found it necessary to prorogue the Parliament. This step broke off the alliance with France. Fresh intrigues, however, were speedily renewed; and against these Lord Russell resolutely opposed himself. Barillon was busy with his French gold. Russell, as well as Sidney, are accused of having received bribes to serve French interests. Lord John Russell, who has written the Life of his noble ancestor, does not hesitate to impeach the honesty of Barillon, rather than have men suppose that such a charge is true. And no one can have observed Lord William Russell's strong sense of justice, his scrupulous integrity, his zeal and energy in every noble and generous undertaking, who would for a moment listen to such a charge. His character is wholly at variance with such an act. However, the testimony of Barillon will be differently estimated by different men; and the reader may consult on the matter the views taken by Macaulay (*History of England*, vol. i.), and Hallam (*Constitutional History*, vol. ii.)

Russell.

Russell.

In no long time the principal Whigs were accused of having conspired to take the king's life as he returned from the Newmarket races. This is known as the "Rye-house Plot," from the name of a farm near Newmarket, where the conspirators agreed to meet. The king having, it is said, returned earlier from Newmarket than was anticipated, the court ascribed to this lucky accident the shielding of his majesty's life. Russell, Essex, Sidney, and a number of others, were at once committed to the Tower. Russell was, on the 13th of July 1683, brought before the Old Bailey on a charge of high treason. He was indicted "for conspiring the death of the king, and consulting and agreeing to stir up insurrection, and to that end to seize the guards for the preservation of the king's person." The evidence against him was contradictory; no one charge in his indictment was proved; yet the sheriffs, who were the tools of the court, secured his conviction. He was accordingly found guilty, and was sentenced to death. During his imprisonment he manifested great calmness and pious resignation. Lady Russell, who had greatly assisted him during his trial, was now near, like an angel of comfort, administering to his wants with the most singular tenderness and resolution. Bishop Burnet and Dean Tillotson attended him; and the former has left a written account of his last days. He was beheaded in Lincoln's Inn Fields on the 21st of July 1683.

Charles James Fox, in alluding to the death of Lord William Russell (*History of James II.*), says, "It is impossible not to assent to the opinion of those who have ever stigmatized the condemnation and execution of Russell as a most flagrant violation of law and justice." The act for annulling Russell's attainder, passed in the first year of William and Mary, says, he "was by undue and illegal return of jurors, for want of freehold, and by partial and unjust constructions of law, wrongfully convicted, attainted, and executed for high treason." (See the *Life of William, Lord Russell*, by Lord John Russell, London, 1819.)

RUSSELL, *William*, a popular historian, the eldest son of Alexander Russell and Christian Ballantine, was born in the year 1741 at Windydoors, a farm-house in the parish of Stowe and county of Selkirk. At an early age he was sent to school in the neighbouring village of Inverleithen, where he acquired an elementary knowledge of the Greek and Latin languages; and private study afterwards enabled him to supply many of the deficiencies of his early education. In 1756 he was removed to Edinburgh, in order to be instructed in writing and arithmetic; and after having attended to these branches for about ten months, he was bound an apprentice to the bookselling and printing business for the term of five years. While engaged in this occupation he discovered the utmost ardour in literary pursuits; nor was his situation unfavourable to the acquisition of useful and elegant knowledge. After the completion of his apprenticeship he published a select collection of modern poems, which was favourably received.

About the year 1763 he made an unsuccessful attempt to adapt Crebillon's *Rhadamsthe et Zénobie* to the English stage. In 1764 he retired to the country, and spent the succeeding autumn with Lord Elibank. He had relinquished his original employment, and he now prosecuted with zeal his historical and literary studies.

Having resided with his father till the month of May 1767, he proceeded to London in quest of honour and emolument. But his high hopes were speedily blasted. After having in vain waited for advancement, he engaged himself as a corrector of the press in the great office of William Strahan, afterwards printer to his majesty. In the year 1769 he quitted the employment of Strahan, and was engaged as overseer of the printing-office of Brown and

Russell.

Adlard. During the same year he published an *Ode to Fortitude*. His *Sentimental Tales* appeared in 1770; and from this time he contributed to the periodical publications many essays in prose as well as verse. In 1772 he published a collection of *Fables, Moral and Sentimental*; and *An Essay on the Character, Manners, and Genius of Women, from the French of M. Thomas*. In 1774 he produced an octavo volume under the title of *Julia, a Poetical Romance*. Of this work, which is founded on the *Nouvelle Héloïse* of Rousseau, neither the plan nor the execution can be commended. Russell is the author of the verses on the death of Hume and on the death of Dr Armstrong, subscribed "W. R.," and dated from Gray's Inn, Sept. 10, 1779, which are commonly printed with the poems of that classical writer. His *History of America*, published in numbers, was completed in the course of the same year. This work was received with some degree of favour; but the splendid merit of Dr Robertson's History precluded all competition. During the same year (1779) he likewise published, in octavo, the first two volumes of *The History of Modern Europe, with an Account of the Decline and Fall of the Roman Empire, and a View of the Progress of Society from the Fifth to the Eighteenth Century, in a Series of Letters from a Nobleman to his Son*. Their reception was so favourable as to exceed his most sanguine expectations. In the year 1783 he published *The Tragical Muse*, a poem addressed to Mrs Siddons. The three volumes which completed the *History of Modern Europe* made their appearance in 1784. His narrative is always free from languor, and his reflections are conveyed in a lively and elegant style. It is, however, to be regretted that he should have adopted the commercial expedient of exhibiting his work as a series of letters from a nobleman to his son: every reader is sufficiently aware that Dr Russell did not belong to the order of nobility; and the frequent recurrence of "my dear Philip" is too apt to remind one of Lord Chesterfield. This work has very often been reprinted, and has still some degree of popularity. Russell closes his History with the peace of Paris in 1763. A continuation, extending to two volumes, was added by the late Dr Coote; and another writer has continued the narrative still farther down.

In the year 1787 he married Isabella Scott, a lady of Eskdale, to whom he had long been attached, and in whom he found a pleasant and intelligent companion. He now entered upon the occupation of a comfortable farm at Knottysholm, in the parish of Canonby and county of Dumfries, where he spent the remainder of his days.

He had now acquired the reputation of a very popular historian; and in 1792 the university of St Andrews conferred upon him the degree of LL.D. During the following year he published at London, in two volumes octavo, *The History of Ancient Europe, with a View of the Revolutions in Asia and Africa, in a Series of Letters to a Young Nobleman*. This production partakes of the peculiar merits of his modern history; but as the author did not live to complete his design, it never attained to the same popularity. Of these two volumes, the greater proportion relates to the history of Greece. Dr Coote was afterwards induced to supply what he had left deficient.

Dr Russell did not long survive the publication of his last work. A stroke of palsy suddenly terminated his life, on the 25th of December 1793, after he had completed the fifty-second year of his age.

He had engaged in various projects which he did not live to execute. Among these was his *History of England from the Beginning of the Reign of George III. to the Conclusion of the American War*, a work on which he was engaged at the close of his life.

R U S S I A.

History.

THE history of Russia commences shortly after the middle of the ninth century, when a Scandinavian race, known as the Varages or Varangians, established their dominion over several of the less warlike Slavonic and Finnish tribes who inhabited the eastern shores of the Baltic. These seem to have made some progress in the arts of peace, and even at this early period to have carried on a considerable commerce. Harassed by more warlike neighbours, they had called in the assistance of the Varangians; but these unscrupulous allies no sooner rid them of their enemies than they established themselves in their country. Ruric, the leader of the Varangians, built a town near the Volkhof, where Old Ladoga now stands, and made it the seat of his government. This is said to have been about A.D. 862. His two brothers Sinaf and Truvor, who had accompanied him, established themselves,—the former at Bielo Ozero, and the latter at Isboisk, near Pleskof. The rightful owners of the soil, however, were not inclined peacefully to submit to this species of usurpation, and accordingly they took up arms under the leadership of Vadim, a chief who had greatly distinguished himself for his military talents. A fierce engagement took place, in which the Varangians were victorious, Vadim and several of the other chiefs having lost their lives. This success emboldened Ruric to extend his territories, and to change the seat of his government from Ladoga to Novgorod, the capital of the Slavi, which was even then a large and opulent city. His brothers Sinaf and Truvor died soon after, and Ruric became sole monarch of the conquered territory, over which he reigned without further molestation for fifteen years. At his death his son Igor was only four years of age, and the government devolved upon his kinsman Oleg. The new ruler did not long remain idle, and one of his first expeditions was against Kief, where two Varangian chiefs, Oskhold and Dir, seem to have established their dominion over the Slavi of that part. To effect his purpose, Oleg had recourse to stratagem; and, taking with him Igor, he descended the Dnieper with a few boats, in which he had concealed a number of armed men. On approaching Kief, he sent a message to the two chiefs, stating that some Varangian merchants, on their way to Greece by order of the Prince of Novgorod, desired to see them as friends and kinsmen. Oskhold and Dir accepted the invitation, and, suspecting no harm, went unarmed and unattended. They no sooner reached the place of meeting than they were surrounded by armed men, and Oleg taking Igor in his arms, cried, "You are neither princes nor of the race of princes; but I am a prince, and this is the son of Ruric." No sooner were these words uttered than the soldiers fell upon the two chiefs and slew them. The inhabitants of Kief, thrown into consternation by this bold and treacherous act, made no resistance, but opened the gates of their city to the invader. But his ambitious designs did not end here. He now meditated an attack upon Constantinople, and for that purpose he removed the seat of his government to Kief. At length he embarked on the Dnieper with 80,000 warriors, on board of no fewer than 2000 vessels. After encountering numerous obstacles, and having several times to disembark and carry their vessels for some distance overland, the Russians at length reached the Black Sea, and, coasting along its shores, they soon arrived at the Strait of Constantinople. To prevent their approach to the city, the inhabitants had thrown a chain across the harbour; but the invaders, not deterred by this, are said to have drawn their vessels ashore, and fitting them upon wheels, by means of sails, converted them into carriages,

Ruric, A.D.

Oleg.

and thus arrived under the walls of the city. The weak Leo, who was then upon the throne, did not offer any resistance, but was content to purchase an ignominious peace, and Oleg returned to Kief laden with wealth. Soon after this Oleg sent deputies to Constantinople with articles of a treaty to be signed by the Greek emperor. From this treaty we learn many important particulars respecting the internal policy of the Russians at the beginning of the tenth century. It shows that they laid great stress upon oaths; that murder was punished by death, and not by fine; that a thief taken in the fact might be killed by the proprietor with impunity, or, if bound and brought before the judge, he was obliged to restore the stolen goods, together with three times their value; that wives had a part of the estates of their husbands; that punishment did not extend to the entire confiscation of goods, and hence the widow and orphan did not suffer for a crime of which they were innocent; that citizens might dispose of their effects in favour of friends, without fear of the sovereign seizing on their heritage. Oleg died in 913, after having conducted the government for thirty-three years, leaving Igor in full possession of the throne, who, up to this time, does not seem to have had any share in the administration. On the accession of the new sovereign, several of the nations that had been subjugated by Oleg attempted to regain their independence. The Drevlians were the first to revolt; but they were soon quelled, and punished by the imposition of an increased tribute. The Uglitches, who dwelt on the southern side of the Dnieper, contended longer for their liberty, and one of their principal towns withstood a siege for three years; but at length they too were subdued and made tributary. Igor had next to contend with a more formidable enemy in the Petchenegans, a nation hitherto unknown, who, quitting their settlements on the Oural and Volga, established themselves on the Don and the Dnieper. Igor finding himself unable to cope with his new enemies, concluded a treaty of alliance with them. About five years afterwards disputes seem to have arisen between them, and both parties had recourse to arms. It appears that the Russians were finally victorious, and the Petchenegans were for some time disabled from giving farther molestation.

We next hear of Igor in 941 setting out on an expedition against the Greeks with, if we may credit the Russian accounts, 10,000 barks, each carrying forty men. The government of the empire, however, was now in different hands from those that had held it during the former invasion. The Greeks were commanded by two able generals, Theophanes and Phocas, the former of whom was over the fleet, the latter over the army. Theophanes attacked them in their ships, and throwing among them the terrible Greek fire, with the effects of which they were totally unacquainted, caused such consternation that many cast themselves into the sea to avoid the flames. Their vessels were dispersed, shattered, or burned, and great numbers of their crews perished. Those that reached the land were immediately attacked by Phocas, so that Igor carried back with him scarcely one-third of his immense army. Though discouraged by this ill success, it did not deter him from making a second attempt, and accordingly, three years afterwards, he set out with a new army, which included many of the Petchenegans whom he had taken into pay. Before he had advanced beyond the Taurican Chersonesus, however, he was met by deputies from the emperor, offering to pay to him the same tribute that his predecessor had received; and Igor, doubtful of the issue of a contest, complied with this offer, and retired with his army. Igor was

History. now far advanced in years, but the insatiable rapacity of his officers impelled him to turn his army against the Drevlians, for the purpose of obtaining from them an increase of their yearly tribute. In this he was at first successful, and was returning home loaded with booty; but, not yet satisfied, he sent home the greater part of his troops with the spoil, and with the remainder marched again into the enemy's country. The Drevlians, now driven to desperation, fell upon him and his followers near the town of Iskorosch, and massacred the whole of them.

Regency of Olga.

Igor's son, Sviatoslaf, was very young at the death of his father, and the regency devolved upon Olga the queen-mother. Her first act was to revenge the murder of her husband. The Drevlians were anxious to renew friendship with the Russians, and their chief made offer of his hand to Olga. Pretending to listen to their overtures, the queen received the messengers kindly, but immediately caused them to be put to death. In the meantime, she requested a larger deputation to be sent to her, consisting of the chief men of the state; and these, on their arrival, she treated in the same inhuman manner, taking care, in each case, that no tidings should reach the Drevlians. She then set out, as if on a friendly visit, to conclude the new alliance, and having invited to a great entertainment some hundreds of the principal inhabitants, she caused them all to be assassinated. Not yet satisfied, she now laid waste the country with fire and sword. The town near which Igor had lost his life long withstood her utmost efforts, the inhabitants dreading the horrible fate that awaited them. At length she had recourse to stratagem, and promised them mercy on condition of receiving all the pigeons in the town. To the tails of these she attached lighted matches, and then set them all at liberty. They of course made for their usual haunts, and the houses being all of wood, the town was speedily in a blaze. The wretched inhabitants, endeavouring to escape the flames, were immediately butchered by the Russians.

Her conversion.

The only other remarkable event during Olga's regency was her conversion to Christianity. Though Christianity seems to have been introduced into Russia before this time, and full liberty allowed to its professors in their worship, yet it had hitherto made little progress. The people were still pagans, practising the most absurd and cruel superstitions. Olga, however, resolved to embrace the Greek religion, and for that purpose undertook a journey to Constantinople about A.D. 955. Constantine Porphyrogeneta, who was then upon the throne, received the royal convert with the greatest respect,—himself conducting her to the baptismal font, where, in the character of sponsor, he gave her the name of Helen. Her example, however, had little effect upon the Russians, and even her son disregarded all her solicitations to become a Christian. She died about

Sviatoslaf.

the year 969. It is not known at what time Sviatoslaf obtained the reins of government, but it is generally supposed to have been about the time of his mother's departure for Constantinople. His first care was to improve the character and discipline of his army, and to this he devoted himself with the greatest zeal, living in the camp, and sharing in the duties and dangers of the meanest of his followers. His food was of the simplest and the coarsest description; and he had no tent, but, wrapt in a bear's skin, usually slept on the bare ground. Nor was he less distinguished for his contempt of danger than for his disregard of the luxuries and conveniences of life. His soldiers emulated his example, and were proud to follow a leader who shared in all their toils and hardships. His army thus became formidable, not so much from its numbers as from the courage and discipline of the soldiers; and having little baggage, they could rapidly move from place to place. His first great expedition was against the Kozares, a people that had come from the shores of the Caspian and the sides of the Cau-

casus, and had established themselves along the eastern side of the Black Sea. He totally vanquished them, and took their capital by storm. He is even said to have annihilated the nation, at least we find no mention of it after that time. The Greek emperor Nicephorus Phocas, harassed by the Hungarians, assisted by his treacherous allies the Bulgarians, applied for assistance to Sviatoslaf, who hastened southward with a large army. He quickly made himself master of all the Bulgarian towns along the Danube, and was so elated with his success, that he resolved to remove the seat of his government from Kiev to Pereiaslavatz, now Yamboly, on the banks of that river. He was, however, obliged to defer his intentions and hasten home, having received intelligence that the Petchenegans, taking advantage of his absence, were ravaging his territory, and had laid siege to his capital. Before his arrival, however, the Petchenegans had, by an artifice of the Russian general, been induced to raise the siege. After reducing them to subjection, Sviatoslaf resumed his design of establishing himself on the Danube. By this time the Bulgarians had recovered most of their towns, and were prepared to resist his encroachments. At length he succeeded in establishing himself in Bulgaria, but by this time the Emperor Nicephorus had been assassinated, and his murderer, John Zimisces, had ascended the throne. The new emperor saw clearly that the Russians would be a more dangerous neighbour than the Bulgarians, and sent ambassadors to the Russian monarch, desiring him to evacuate Bulgaria, in terms of his treaty. This Sviatoslaf refused to do, and prepared to maintain his ground by force. He raised his army by the addition of Bulgarians, Petchenegans, and Hungarians, to the number of 300,000 men. He first made an incursion into Thrace, burning and ravaging in all directions, and laid siege to Adrianople, but was defeated by stratagem by the commandant of that town. This was succeeded by a series of other losses, and his army was further weakened by desertions among the allied troops, until a great part of them were shut up in the city of Pereiaslavatz. The city was taken by assault, but 8000 of the Russians threw themselves into the citadel, which was considered impregnable. The enemy, however, succeeded in setting it on fire; many threw themselves from the summit of the rock, others perished in the flames, and the rest were taken captive. Sviatoslaf, who had not been shut up in Pereiaslavatz, now took refuge in Durostole, the strongest of the few towns that now remained to him on the Danube. It was immediately besieged by the enemy; and the Russians, reduced to extremity, made a sally from the town. A desperate battle ensued, in which the Russians were defeated; and Sviatoslaf made for Russia with the shattered remains of his army. Contrary to the advice of his most experienced officers, he attempted the navigation of the Dnieper, and was intercepted near the cataracts of that river by his old enemies the Petchenegans. After remaining on the defensive all winter, exposed to famine and disease, he attempted to force his way through the enemy, but was defeated, and himself slain. He was succeeded by his three sons—Yaropolk in Kiev, Vladimir in Novgorod, and Oleg in the country of the Drevlians. Vladimir A war soon took place between Yaropolk and Oleg, in which the latter was defeated and slain; and Vladimir, dreading a similar fate, abandoned his dominions, which were quietly seized on by the Kievan prince. He did not, however, long enjoy his success; for Vladimir, who had taken refuge among the Varangians, returned with succours which enabled him not only to secure his possessions, but to make war on the Kievan territory. Yaropolk's chief adviser, Blude, was in the interest of his brother, and led him on to his ruin. He was thus prevailed upon to leave his capital, which immediately opened its gates to the enemy; and was afterwards induced to throw himself on

History.

History. the mercy of his brother, by whom he was ordered to be put to death. The commencement of Vladimir's reign was but a continuation of those atrocities by which he had obtained the throne. The traitor Blude was one of the first to suffer. For three days he was treated with the highest distinction, at the end of which time the king said :—"I have now fulfilled my promise ; as executor of justice, I condemn you to death ;" and caused him to be immediately executed. He displayed like perfidiousness towards the Varangians, who had assisted in placing him upon the throne. They were beginning to feel the effects of his ingratitude, and so they asked permission to go and seek their fortune in Greece. He granted their request, but also privately advised the emperor of their approach ; so that they were arrested and secured. He engaged in numerous wars with the neighbouring states,—the Poles, Bulgarians, Petchenegans, and others ; and being generally successful, he added very considerably to his territory. He was very devout in his religious duties, and usually sacrificed a number of his prisoners at the shrine of his gods. On one occasion, to show his devotion, he resolved to sacrifice one of his own subjects, and his choice fell upon a young Varangian, whose father had adopted the Christian faith. The unhappy father refused the victim, and the people, enraged at what they considered an insult to their gods, assaulted the house, and slew both father and son, folded in mutual embrace. Yet this furious pagan and bloody warrior became afterwards equally zealous in the cause of Christianity. The fame of Vladimir's military exploits had rendered him so formidable to the neighbouring nations that each courted his alliance, and strove to unite him by the ties of the same religion with themselves. Determined to act with judgment, Vladimir despatched deputies to inspect the religious tenets and ceremonies of the several nations, and to report. The accounts of the imposing splendour of the Greek worship, and the gorgeous decorations of the priests and churches, attracted his attention, and he resolved to join that church. Being too proud to seek from the Greek emperor a priest to instruct him in the Christian religion and administer baptism, he resolved to obtain one by arms. Assembling his army, he marched to Taurida, and laid siege to Theodosia. After a lengthened siege, he obtained possession of the town, and soon after of the whole of the Crimea. He might now have obtained baptism, but he was also desirous of an alliance with the Greek monarch, and therefore demanded in marriage Anna, sister of Basilus and Constantine, who were then upon the throne. After some deliberation, his request was complied with, on condition that he and his people should become Christians. These conditions being accepted, the Russian monarch was baptized, and took the name of Basilus, receiving the Grecian princess, and carrying with him several popes and archimandrites, together with sacred vessels and church books, images of saints, and consecrated relics. The change effected in his conduct by his conversion to the Christian faith was, if we may credit the Russian accounts, most marked. Formerly delighting in human blood, he could now scarcely be prevailed upon to sanction the death of the greatest criminal ; instead of destroying cities and laying waste territories, he now built churches and endowed seminaries of education ; and though he is said to have had six wives and 800 concubines, he now became faithful to the imperial princess. He destroyed the idols that he had formerly worshipped, and used every exertion to persuade his subjects to adopt the Christian religion.

History. His last days were embittered by domestic vexations. His wife and one of his favourite sons died long before him ; while another of his sons, Yaroslaf, on whom he had bestowed the government of Novgorod, refused to acknowledge him as his hege lord, and applied to the Varangians for assistance against his father. The aged Vladimir, compelled to march against a rebellious son, died of grief upon the road, after a long and glorious reign of thirty-five years. The improvements introduced by this prince were great and permanent. With the Christian religion he imported from Greece the arts which then flourished in that empire ; and almost entirely new-modelled the language of his country, by engrafting on it the more refined dialect of the Greeks and adopting in a great measure the letters of their alphabet. He extended the boundaries of Russia westward along the shores of the Baltic into Lithuania and Poland ; southward along the shores of the Euxine, so as to include the Crimea and great part of the Bulgarian territories ; and eastward to the Oka, the Don, and the Volga.

Vladimir had before his death divided his territories among his twelve sons, reserving to himself and his immediate heir the principality of Kief. This was the occasion of almost perpetual warfare among the brothers. Sviatopolk, who had obtained possession of Kief after the death of his father, attempted by stratagem and force to possess himself of some of the neighbouring principalities. Yaroslaf, Prince of Novgorod, took up arms to stop his encroachments, and forced him to flee for refuge and succour to his father-in-law, Boleslaus of Poland. The latter accompanied him back to Russia with an army, and forced Yaroslaf to retreat with precipitation. Sviatopolk now plotted the destruction of his allies, and a massacre ensued in which many of the Poles lost their lives ; whereat Boleslaus was so enraged that he plundered Kief and several other towns, and then left his perfidious son-in-law to shift for himself. He next applied for assistance to the Petchenegans, and with an army of these auxiliaries offered battle to Yaroslaf. The contest was long and bloody, but at length terminated in favour of Yaroslaf. Sviatopolk died soon afterwards. By this victory Yaroslaf became possessed of the greater part of his father's dominions. He advanced the Christian religion by causing the Bible to be translated into the Russian language, and circulated. He also established a metropolitan at Kiev, and devoted himself generally to the advancement of his people. He drew up a code of laws for Novgorod, which is still known as the municipal law of Novgorod. He is supposed to have died about 1054, after a reign of thirty-five years. Like his father, he divided his territories among his sons, but exhorted them on his deathbed to live in peace and harmony among themselves. From his death to the beginning of the thirteenth century, the history of Russia comprises little else than a continued series of intestine commotions and petty wars with the neighbouring states. The same system of dismemberment was continued by the succeeding princes, and was attended with the same result. There were during this period not fewer than seventeen independent principalities, though these were at length reduced to seven, viz., those of Kief, Novgorod, Smolensk, Vladimir, Tver, Halitch, and Moskva or Moscow. Of these, Kief and Novgorod long continued to be the most powerful, though they could not always maintain their superiority over the others ; and towards the latter end of the period which we have mentioned, the district of Vladimir erected itself into a grand principality, and became at least as powerful as Kief and Novgorod.¹

Embraces
Christianity.

¹ In the supremacy of these three great principalities we may trace the division of European Russia into Great, Little, and White Russia, a distinction which long maintained its ground, and in later times gave to the sovereign of this empire the title of monarch or emperor of all the Russias. Great Russia comprehended the principality of Novgorod, and extended northward to the White Sea, eastward to the River Dvina and the entrance of the Petchora into the Ural Mountains, whilst to the south it bordered on the district of Vladimir as far as the Volga and the mouth of the Medveditza, and to the west on Lithuania and Prussia, including the tributary

History.
Tartar
eruptions.

Such a state of anarchy and confusion held out a strong temptation to powerful states in the vicinity. In the neighbourhood of the Sea of Aral, not far from the confines of Vladimir and Kiev, the wandering hordes of Mongols, or Mongol Tartars, took up their residence, about the year 1223, under the conduct of Tuschii, son of the famous Tschinghis Khan, chief of the Mogul empire. From the Aral, Tuschii conducted his horde along the shores of the Caspian Sea, and gradually approached the Dnieper. In his course he attacked and overcame the Tscherkasses, or Circassians, who on his approach had joined with the Polovtzes to resist the terrible enemy. The defeated Polovtzes gave notice to their neighbours the Russians of the approaching storm, and the two united their armies to oppose the common enemy. A furious engagement took place near the small river Kalka, which flows into the Sea of Azoff, and ended in the complete overthrow of the Russians and their allies.

About thirteen years after this defeat another horde of Tartars, headed by Baaty Khan, the grandson of Tschinghis Khan, penetrated into Russia, after having attacked and defeated their neighbours the Bulgarians. The invaders soon spread far and wide the terror of their name. Wherever they came, the whole face of nature was laid waste; towns and villages were destroyed by fire; all the men capable of bearing arms were put to the sword, and the children, women, and old men, carried into captivity.

They advanced unimpeded to the capital of Vladimir, which, left to its fate by the Grand Prince Yury, who, with unpardonable negligence, was celebrating a marriage feast when he ought to have been employed in collecting the means of defence against the enemy. The city, which contained the princess and two of her sons, was left to the protection of a chieftain totally unqualified for its defence, and fell an easy prey into the hands of the Tartars; who, like wild beasts, glutted their appetite for blood amongst the wretched inhabitants. The grand princess, and other ladies of distinction, had taken refuge in the choir of a church; but it was set on fire by the barbarians, and they perished in the flames. Yury, incensed almost to desperation, assembled all his forces, and marched against the enemy. Though his army was greatly inferior in number, he attacked them with the most determined valour; but victory was with the Tartars, and the body of Yury was found amongst the slain. This appears to have been the only vigorous stand made by the Russian princes. The Tartars pushed forward with rapidity, and successively overpowered the principalities of Novgorod and Kiev.

They had now established themselves in the Russian territories, and their khan or chief, though he did not himself assume the nominal sovereignty, reigned as paramount lord, and placed on the throne any of the native princes whom he found most obsequious to his will, or who had ingratiated themselves by the magnificence of their presents. Till the middle of the fourteenth century the miseries of a foreign yoke were aggravated by all the calamities of intestine discord and war; whilst the knights of Livonia on one side, and the Poles on the other, lost no opportunity of attacking Russia, took several of its towns, and even some considerable countries.

Dimitri
Ivanovitch,
a.n. 1362.

About the year 1362 Dimitri Ivanovitch received the sovereignty from the Tartar chief, and established the scat

of his government at Moscow. This prince possessed considerable ambition, and contrived to inspire the other Russian princes with so much respect for his person and government that they consented to hold their principalities as fiefs under him. This excited the jealousy of Mammai, the Tartar khan, who determined to take measures for maintaining his superiority. He began by demanding an increase of tribute; but when Dimitri demurred to this, the khan not only insisted on his demand, but required the grand prince to appear before him in person. This requisition Dimitri thought proper to refuse, and prepared to support his refusal by force of arms. A combination of favourable circumstances operated strongly in favour of Dimitri. The terror with which the Russians had at first viewed the Tartars had now in a great measure subsided; while the haughty bearing of the latter, with their barbarism and paganism, served to keep alive the hatred with which they had ever been viewed. The clergy, too, did all in their power to foster the spirit of revolt, and promised crowns of glory to all who should fall in battle. Thus the grand duke soon found himself at the head of an army of 200,000 men, with which he marched towards the Don, on the southern bank of which the Tartars were encamped in numbers greatly exceeding his own forces. This, however, did not deter him from crossing the river, and the fight commenced with the greatest fury on both sides. The issue was long doubtful; but victory at length declared for the Russians. The Tartars appear to have been so much humbled by this defeat that for a time they left the Russians to enjoy in peace their recovered liberty. This forbearance, however, was not of long duration. Before the death of Dimitri, returning with increased numbers, they laid siege to Moscow, which, after an obstinate defence, was at length induced to surrender, and Russia once more submitted to her old masters.

Dimitri died in the year 1389, and was succeeded by his son Vasilii Dimitrievitch. In the reign of this prince a new incursion of the Tartars took place, under the great Timur or Tamerlane, who, having subdued all the neighbouring Tartar hordes, extended his conquests to the Russian territories, took Moscow by assault, and carried off immense plunder.

The grand principality of Vladimir, or, as it may now be called, of Moscow, had at the end of the fourteenth century attained its greatest height, whilst that of Kiev had proportionally declined. This latter principality was, at the time of which we are now writing, under the dominion of the Poles, having been seized on in 1320 by Godemin, Duke of Lithuania.

The later part of the fifteenth century forms a splendid epoch in the history of Russia. At this time,—viz., from 1462 vitch. to 1505,—reigned Ivan Vasilivitch, or, as he is commonly called, John Basilovitch. This able prince, by his invincible spirit and refined policy, became both the conqueror and deliverer of his country, and laid the first foundation of its future grandeur. Observing with indignation the narrow limits of his power at his accession to the throne, he began immediately to resolve within himself upon the means of enlarging his dominions. He demanded and obtained in marriage Maria, sister of Michael, Duke of Twer, whom he soon afterwards deposed, on pretence of revenging the injuries done to his father, and added this duchy to his own territories of Moscow. Maria, by whom he had a son, who died before him, did not live long; and upon her death he

History.

tribes on the Baltic, as far as Memel. Its capital was Novgorod. Little Russia extended on the north along the River Ager to White Russia, on the east above the Donetz and the Oka to the Polovtzes and the Petchenegans, whilst to the south it stretched as far as the Tauric Chersonesus or the Crimea, and to the west along the banks of the River Goryn. This was the principality of Kiev, and in that city was the seat of government. The principality of Vladimir received the name of White Russia. It extended northward along the Volga to the southern boundary of Great Russia; to the east it bordered on the possessions of the Ugres and the territory of the Mordvines, stretching down the Volga to the mouth of the Oka; and to the south it extended along the Oka to the principality of Riazan and the Bulgarian territory. The metropolis of this division was at first Shuja, and afterwards in succession Rostof, Susdal, and Vladimir, till at length the seat of government was transferred to Moscow.

History. married Sophia, daughter of Thomas Palæologus, who had been driven from Constantinople, and forced to seek shelter at Rome, where the Pope portioned this princess, in hopes of thus procuring great advantage to the Catholic religion; but his expectations were frustrated, Sophia being obliged to conform to the Greek Church after her arrival in Russia.

This princess, shocked at the servile manner in which her husband was treated by the proud Tartars, stirred him up to resistance. He gradually increased his forces, and at length openly disclaimed all subjection to the Tartars, attacked their territories, and made himself master of Kazan. Here he was solemnly crowned, about the year 1470, with a diadem which is said to be the same that is still used in the coronation of the Russian sovereigns. He afterwards carried his arms against the neighbouring states. Asiatic Bulgaria and great part of Lapland soon submitted to him; and the great Novgorod, a city then so famous that the Russians were accustomed to intimate their idea of its importance by the proverbial expression, "Who can resist God and the great Novgorod?" was reduced by his generals after a seven years' siege, and yielded immense treasure. After he quitted the city, which had been awed by his presence, the discontents, excited at his violent measures, broke out into acts of mutiny, upon which he, in 1485, carried off fifty of the principal families, and distributed them through several of the Russian towns. He afterwards removed some thousands of the most considerable inhabitants, and substituted for them more loyal subjects from other places. By these proceedings the flourishing commerce of this city received a considerable shock, and it suffered still more by the imprisonment of all the German merchants, and the confiscation of their effects, with the abolition of the old municipal franchises. Indeed from this period Novgorod never recovered its former splendour.

After his reduction of this city, Ivan invaded the territories of Livonia and Esthonia, in consequence, as we are told, of an affront offered to him by the inhabitants of Revel. Here, however, he met with a stout resistance, and does not seem to have made much progress. Towards the conclusion of his reign the Kazanian Tartars, who, though humbled, had continued to inhabit that district, made a hard struggle to shake off the Russian yoke that had been imposed on them; but Ivan had established his authority too firmly for them to accomplish their purpose during his life. He died in 1505, and was succeeded by his son Vasilii Ivanovitch, commonly called Basilus III.

About fourteen years after the death of Ivan, the Tartars of Kazan rebelled against the Russian yoke, and united themselves with their brethren of the Crimea. With their assistance, they assembled a mighty force, entered the Russian dominions, and carried their arms even to the gates of Moscow. The grand prince Vasilii finding himself at that time unable to resist the barbarians, purchased an exemption from general pillage by great presents and a promise of renewed allegiance. The Tartars retired, but carried off immense booty, and nearly 300,000 prisoners, the greater part of whom they sent to Theodosia in the Crimea, and sold to the Turks. Vasilii, however, was soon enabled to make head against the Tartars, and to recover possession of the city Kazan, and of Pscove, a city which had been built by the Princess Olga, and was the great rival of Novgorod in wealth and commercial importance. Under this prince all the principalities of Russia were once more united, and they have remained ever since under the dominion of one sovereign. He died in 1533, having reigned 28 years.

Ivan IV.

It was under the son and successor of Vasilii, Ivan IV., or, as he is styled by the Russian historians, Ivan Vasilievitch II., that Russia completely emancipated herself from her subjection to the Tartars, and acquired a vast accession of territory, which extended her empire into the N.E. of Asia, and rendered her for the first time superior in ex-

VOL. XIX.

tent to any state that had appeared since the Roman empire. He was only three years old when his father died; and during his minority the state became a prey to anarchy and confusion. But when he attained his seventeenth year he was able to assume the reins of government; and he displayed so much prudence and manly fortitude as soon raised him very high in the estimation of his subjects. His first aim was to still the contending factions which surrounded him; and he then resolved to attempt liberating his country from the dominion of the Tartars. In 1551 he marched an army in the depth of winter into the district of Kazan, and laid siege to the capital, which he made himself master of in 1552, by the new, and, to the Tartars, unheard-of method of springing a mine below the walls. By this important conquest the dominion of the Tartars, who had oppressed the Russians for more than three centuries, was completely and permanently overthrown. About two years later Ivan extended his conquests eastward to the shores of the Caspian, and took possession of the territory that lay on the right bank of the Volga, round the city of Astracan, and which was also inhabited by the Tartar hordes. In 1570 the inhabitants of Novgorod being suspected of forming a plot for delivering that city and the surrounding territory into the hands of the King of Poland, felt still more severely the effects of his vengeance. All who had been in any degree implicated in the conspiracy, to the number of 25,000, suffered by the hands of the executioner. The city of Pscove was threatened with a similar proscription; but Ivan, on their voluntary submission, contented himself with the execution of a few monks, and the confiscation of the property of the most opulent inhabitants.

In 1547 Ivan sent a splendid embassy to the Emperor Charles V., requesting a number of German artists, mechanics, and literary men to be sent into Russia. Several hundred volunteers were thus collected; but they were intercepted in their journey through Livonia, and obliged to return home, though some of them escaped and succeeded in reaching Moscow. Ivan endeavoured to revenge himself on the Livonians by invading their country, which was strenuously defended by the Teutonic Knights; and these champions, finding at last that they were unable to maintain their ground, put the territory under the protection of Poland. The Swedes also received a share of the Livonian territories; and this circumstance gave rise to a war between them and the Russians. Ivan invaded Finland; but that country was bravely defended by William of Furstenberg, grand-master of the Livonian Knights, with the assistance of the troops of Gustavus Vasa; and it does not appear that Ivan gained much in this expedition, though we are told that the Livonian grand-master ended his life in a Russian prison. In 1553 some Englishmen, who were at that time on a voyage of discovery, landed on the shores of the White Sea, where soon after was built the port of Arkhangel. They were hospitably received by the natives; and intimation of the circumstance being conveyed to Ivan, he sent for the strangers, and was so much pleased with their abilities and deportment that he resolved to give every encouragement to the English commerce. It was in consequence of this accidental communication between the Russians and the English that England first engaged in a trade to Russia, and promoted this new commerce by the establishment of a company of Russian merchants in London.

About twenty years after Astracan had been annexed to the Russian empire, a new acquisition of territory accrued to it from the conquests of a private adventurer, in the unknown regions of Siberia. A merchant named Stroganof, who was proprietor of some salt-works on the confines of Siberia, perceiving among the persons who came to him on affairs of trade men who belonged to no nation with which he was acquainted, he questioned them concerning the

History.

place whence they came, and once sent a few of his people with them back to their country. These brought with them, at their return, a great quantity of valuable furs, and thus opened to their master a new road to wealth. The attention of the government was thus directed to this country, but the conquest of it was reserved for an adventurer or robber named Timoseyef Yermak. This Yermak, at the head of a gang of Don Kozzacks of not fewer than 6000 men, in fleeing from a band of Russian troops, came accidentally to the dwelling of Stroganof, where, hearing much about Siberia, they resolved to seek there at once their safety and their fortune. After numerous struggles and conflicts with the natives, which greatly reduced their numbers, they at length conquered the capital, and shortly after the whole country. Yermak now presented the fruit of his toilsome and perilous victories to his czar, and thereby obtained a pardon of his former depredations. The less and the greater Kabardey were also added to Russia in the reign of Ivan. This czar, however, not only enlarged the circumference of his empire, but he also attempted to reform his people, to render them more polished, more skilful, and more industrious; but this he found to be a most arduous enterprise. The insuperable impediments which threw themselves in the way of the execution of this grand work were the principal incitements to those frequent acts of cruelty and despotism which have covered his memory with so deep a stain.

His victories over the Tartars.

Towards the close of Ivan's reign a prodigious army of Tartars entered Russia, with a design to subdue the whole country. But Zerebrinoff, the czar's general, having attacked them in a defile, put them to flight with considerable slaughter. They then retired towards the mouth of the Volga, where they expected a considerable re-inforcement; but being closely pursued by the Russians and the Taitars in alliance with them, they were again defeated, and forced to fly towards Azof, where their army was almost annihilated. In 1571, instigated by the Poles, the Crim Tartars again invaded the country with an army of 70,000 men, which totally defeated the Russians in a battle fought within 18 miles of the city of Moscow. The czar retired with his most valuable effects to a well-fortified cloister; upon which the Tartars entered the city, plundered it, and set fire to several churches. A violent storm which happened at the same time soon spread the flames all over the city, which was entirely reduced to ashes in six hours. The fire likewise communicated itself to a powder magazine, by which upwards of fifty rods of the city wall, with all the buildings near it, were destroyed; and, according to the historians, upwards of 120,000 citizens were burned or buried in the ruins. The castle, however, which was strongly fortified, could not be taken; and the Tartars, hearing that a formidable army was coming against them under the command of Magnus, Duke of Holstein, whom Ivan had made king of Livonia, thought proper to retire. The Livonians, the Poles, and the Swedes, having united in a league against the Russians, gained great advantages over them; and in 1579 Stephen Batory, who was then raised to the throne of Poland, levied an army expressly with a design of invading Russia, and of regaining all that Poland had formerly claimed, which, indeed, was little less than the whole empire. Ivan found his undisciplined multitudes unable to cope with the regular forces of his enemies; and it is possible that the number of enemies which now attacked Russia might have overcome the empire entirely, had not the allies grown jealous of each other. The consequence of this was, that in 1582 a peace was concluded; shortly after which the czar, having been worsted in an engagement with the Tartars, died in the year 1584. His eldest son Feodor (or, as he is commonly called, Theodore) Ivanovitch was by no means fitted for the government of an empire so extensive, and a people

Reign of
Feodor
Ivanovitch.

so rude and turbulent; and to obviate the effects of this incapacity, Ivan had appointed three of his principal nobles as administrators of the empire, whilst to a fourth he committed the charge of his younger son Dmitri or Demetrius. This expedient, however, failed of success, partly from the mutual jealousy of the administrators, and partly from the envy which their exaltation had excited in the other nobles. The weak Feodor had married a sister of Boris Gudonof, a man of great ambition, immense riches, and tolerable abilities. He had long directed his wishes towards the imperial dignity, and began to prepare the way for its attainment by removing Dmitri. This young prince suddenly disappeared; and there is every reason to believe that he was assassinated by the order of Boris. Feodor did not long survive his brother, but died in 1598, not without suspicion of having been poisoned by his brother-in-law.

History.

With Feodor ended the family of Ruric, a dynasty which had enjoyed the supreme power in Russia for more than 700 years. On the death of Feodor, as there was no hereditary successor to the vacant throne, the nobles assembled to elect a new czar; and Boris having, through the interest of the patriarch, procured a majority in his favour, was declared sovereign. Notwithstanding the means that he had used to obtain imperial power, Boris seems to have employed it in advancing the interest of the nation, and in improving the circumstances of his people. He was extremely active in his endeavours to extend the commerce and improve the arts and manufactures of the Russian empire; and for this purpose he invited many foreigners into his dominions. Soon after the commencement of his reign the city of Moscow was desolated by one of the most dreadful famines recorded in history. Parents are said to have eaten their children, and children their parents; and we are told by one writer of the time that he saw a woman bite several pieces out of her child's arm as she was carrying it along. This dreadful calamity lasted three years, notwithstanding all the exertions of Boris to mitigate its severity. During these distresses the power of Boris was threatened by an adventurer who pretended to be the young prince Dmitri, whom he had caused to be assassinated. This adventurer was a monk named Otrepief. He retired from Russia into Poland, where he had the dexterity to ingratiate himself with some of the principal nobles, and at length even the King of Poland was brought over to his party. The Kozzacks of the Don also, who were oppressed by Boris, eagerly embraced the opportunity of declaring in his favour; and although Boris did all in his power to destroy the illusion, by prohibiting all intercourse between his subjects and the Poles, the cause of the pretender rapidly gained ground in Russia. He soon made his appearance on the frontiers with a regiment of Polish troops and a body of Kozzacks, and signally defeated an army sent by Boris to oppose him. He greatly strengthened his cause by treating his prisoners with the utmost humanity, and strictly enjoining his troops not to molest the inhabitants in passing through the country. This gentle behaviour, when contrasted with the horrible excesses committed by the soldiers of Boris, gained Dmitri more adherents than even the persuasion that he was the lawful sovereign of the country. At length, Boris, unable to resist the torrent of public opinion in favour of his rival, is said to have taken poison, and thus hastened that fate which he foresaw awaited him if he should fall into the hands of his enemies.

Accession of Boris, and termination of the dynasty of Ruric

The death of Boris took place in the year 1605; and though the principal nobility at Moscow placed his son Feodor on the throne, the party of Dmitri was now so strong that Feodor was dethroned and sent to prison with his mother and sister, within six weeks after his accession. The successful monk now made his entry into Moscow with the utmost magnificence. One of his first acts was

History.

to remove the son of Boris, whom he caused to be strangled, together with one of his sisters. Though possessed of considerable abilities, he was deficient in prudence; and the partiality that he showed towards the Poles, and the contempt with which he treated the Russian nobility, so exasperated the Russians that discontents and insurrections arose in every quarter of the empire. The people were still further incensed by the clergy, who declaimed against Dmitri as a heretic, and by Schuiskoy, a nobleman who had been condemned to death by the czar, but had afterwards been pardoned. This nobleman put himself at the head of the enraged mob, and led them to attack the palace. They entered it by assault, put to the sword all the Poles whom they found within its walls, and afterwards extended their massacre to such as were discovered in other parts of the city. Dmitri himself, in attempting to escape, was overtaken by his pursuers and thrust through with a spear; and his dead body, being brought back into the city, lay for three days before the palace, exposed to every outrage that malice could invent or rage inflict.

Schuiskoy was now raised to the vacant throne, but his reign was short and uninteresting; and indeed, from this time till the accession of the House of Romanof in 1613, the affairs of Russia have little to gratify our curiosity. The Russians, dissatisfied with the reigning prince, treated with several of the neighbouring potentates for the disposal of the imperial crown. They offered it to Vladislaf or Uladislaf, son of Sigismund, King of Poland, on condition that he should adopt the Greek persuasion; but as he rejected this preliminary, they turned their eyes first on a son of Charles IX. of Sweden, and then on a young native Russian, Mikhail Feodorovitch, of the House of Romanof, a family which was distantly related to their ancient czars, and of which the head was then metropolitan of Rostof; and as such held in great estimation. The influence of the clergy, who excited themselves for Mikhail, both by personal intrigues and by the dissemination of pretended revelations from heaven, silenced the supporters of the other claimants; and, after a long series of confusion and disaster, there ascended the Russian throne a family whose descendants have raised the empire to a state of grandeur and importance unequalled in any former period.

State of the empire at the beginning of the 17th century.

At this period the government of Russia may be considered as a pure aristocracy, since the supreme power rested in the hands of the nobles and the superior clergy. In particular, the boyars, or chief officers of the army, who were also the privy counsellors of the prince, possessed a very considerable share of authority. The election of the late princes Boris, Dmitri, and Schuiskoy had been conducted principally by them, in concert with the inhabitants of Moscow, where was then held the seat of government. The common people, especially those of the inferior towns, though nominally free, had no share in the government or in the election of the chief ruler. The boors, or those peasants who dwelt on the noblemen's estates, were almost completely slaves, and transferable with the land on which they dwelt. An attempt to annul this barbarous vassalage had been made both by Boris and by Schuiskoy, but from the opposition of the nobles it was abandoned.

The laws then in force consisted partly of the municipal laws drawn up for the state of Novgorod by Yaroslav, and partly of an amended code, called *Sudebnik*, promulgated by Ivan Vasilivitch II. By this *Sudebnik* the administration of the laws was made uniform throughout the empire, and particular magistrates were appointed in the several towns and districts, all subject to the czar as their chief. The *Sudebnik* consisted of ninety-seven articles, all containing civil laws; as the penal statutes are only briefly mentioned in some articles, so as to appear either connected with the civil, or as serving to illustrate them. The criminal laws were contained in a separate code, called

History.

Gubnaia Gramota, which is now lost, but is referred to in the civil code. In neither of these codes is there any mention of ecclesiastical affairs; but these were regulated by a set of canons drawn up in 1542, under the inspection of Ivan Vasilivitch, in a grand council held at Moscow. In the civil statutes of the *Sudebnik* theft was punished in the first instance by restitution; or, if the thief were unable to restore the property stolen, he became the slave of the injured party till by his labour he had made sufficient compensation. Of murder nothing is said, except where the person slain was a lord or master, when the murderer was to be punished with death. There is no mention of torture, except in cases of theft. Notwithstanding that attempts had been made by Ivan I., Ivan Vasilivitch II., and Boris, to cultivate their manners and to improve the state of their arts and manufactures, the Russians were still deplorably behind the rest of Europe in civilization.

At the accession of Mikhail, who was crowned in June 1613, the Swedes and Poles were in possession of several parts of the empire; and to dislodge these intruders was the first object of the new czar. He began by negotiating a treaty of peace with Sweden, agreeing to give up Ingria and Karelia, and to evacuate Esthonia and Livonia. A numerous body of Poles next entered Russia, to support the claims of their king's son Vladislaf. Mikhail, however, instead of opposing them in the open field, entrapped them by ambuscades, or allured them into districts already desolated, where they suffered so much from cold and hunger that in 1619 they agreed to a cessation of hostilities for fourteen years and a half, on condition that the Russians should cede to Poland the government of Smolensk.

Mikhail now applied himself to arranging the internal economy of his empire, and formed treaties of alliance with the principal commercial states of Europe. He also commenced those improvements of the laws which were more fully executed by his son and successor; but the tide of party ran so high that he could effect only a very imperfect reformation. He died in 1645, and was succeeded by his son Alexei, who being then only fifteen years of age, a nobleman named Morosof was appointed his governor and regent of the empire. This man possessed all the ambition of Boris, without his prudence and address; and in attempting to raise himself and his adherents to the highest posts in the state, he incurred the hatred of all ranks of the people. Though, by properly organizing the army, he provided for the defence of the empire against external enemies, he shamefully neglected internal policy, and connived at the most flagrant enormities in the administration of justice. The populace at length rebelled against these abuses, and were only pacified by the execution of one of the most nefarious of the judges, Morosof's life being spared at the earnest entreaty of the czar.

An. 1645.
Accession of Alexei Mikhailovitch.

Similar disturbances had broken out at Novgorod and Pscov; but they were happily terminated, chiefly through the exertions of the metropolitan Nikon, a man who, though of low birth, by his reputation for extraordinary piety and holiness, had raised himself to the patriarchal dignity, and was high in favour with Alexei. The pacific conduct of the neighbouring states did not long continue, though, indeed, we may attribute the renewal of hostilities to the ambition of the czar.

The war with Poland was occasioned by Alexei's supporting the Kozzacks, a military horde, who, after the subjugation of the Tatars, had put themselves under the guardianship of Poland. As the Polish clergy, however, attempted to impose on them the Catholic faith, they threw off their allegiance, and claimed the patronage of Russia. Alexei gladly received them as his subjects, hoping by their assistance to recover the territories which had been ceded to Poland by his father. The Russians, assisted by the Kozzacks, were so successful in this contest that the King of

War with Sweden and Poland.

History.

Sweden became jealous of Alexei's good fortune, and determined to take a very active part in the war, especially as the Lithuanians, who were extremely averse to the Russian dominion, had sought his protection. The war with Sweden commenced in 1656, and lasted for two years, without any important advantage being gained by either party. A truce was concluded in 1658 for three years, and at the termination of this period a solid peace was established. In the meantime, the war with Poland continued, but was at length terminated by an armistice, which was prolonged from time to time during the remainder of Alexei's life.

The authority which Alexei had obtained over the Don Kozzacks excited the jealousy of the Sublime Porte, and after a successful attempt on the frontiers of Poland, a Turkish army entered the Ukraine. Alexei endeavoured to form a confederacy against the infidels among the Christian potentates of Europe; but the age of crusading chivalry was over, and the czar was obliged to make head against the Turks with no assistance but that of the King of Poland. The Turkish arms were for some years victorious, especially on the side of Poland; but at length a check was given to their successes by the Polish general Sobieski, who afterwards ascended the throne of that kingdom. Hostilities between the Turks and Russians were not, however, terminated during the reign of Alexei, and the czar left to his successor the prosecution of the war.

The reign of Alexei is most remarkable for the improvements introduced by him into the Russian laws. Before his time the *Emmanoy Ukases*, or personal orders of the sovereign, were almost the only laws of the country. These edicts were as various as the opinions, prejudices, and passions of men; and before the days of Alexei they produced endless contentions. To remedy this evil, he made a selection, from all the edicts of his predecessors, of such as had been current for a hundred years, presuming that these either were founded in natural justice, or during so long a currency had formed the minds of the people to consider them as just. This digest, which he declared to be the common law of Russia, and which is prefaced by a sort of institute, is known by the title of the *Uloshemè* or "Selection." It was long the standard law-book, all edicts prior thereto being declared to be obsolete.

An. 1676.
Reign of
Feodor.

Alexei died in 1676, leaving three sons and six daughters. Two of the sons, Feodor and Ivan, were by a first marriage; the third, Peter, by a second. The two former, particularly Ivan, were of a delicate constitution, and some attempts were made by the relations of Peter to set them aside. These attempts, however, proved unsuccessful; and Feodor became the successor of Alexei.

The reign of this prince was short, and distinguished rather for the happiness which the nation then experienced than for the importance of the transactions which took place. One important service he rendered to his country places his energy and talent in a very favourable light, and that was his causing the destruction of the family registers of the nobility, and thus removing an endless source of contention in the kingdom. The Russian noble placed the highest value upon his ancestry; and to such an extent was this carried that no one would take an office under one with a shorter or less distinguished pedigree than himself. All these registers Feodor ordered to be brought to Moscow, under the pretence of adjusting certain errors that had crept into them, and then caused them to be burned. He continued the war with the Turks for four years after his father's death, and at length brought it to an honourable conclusion by a truce for twenty years, the Turks acknowledging the Russian right of sovereignty over the Kozzacks. Feodor died in 1682, having nominated his half-brother Peter his successor.

The succession of Peter, though appointed by their fa-

vourite czar Feodor, was by no means pleasing to the majority of the Russian nobles, and it was particularly opposed by Galitzin, the prime minister of the late czar. This able man had espoused the interest of Sophia, the sister of Feodor and Ivan, a young woman of eminent abilities and the most insinuating address. Sophia, upon pretence of asserting the claims of her brother Ivan, who, though of a feeble body and weak intellect, was considered as the lawful heir of the crown, had really formed a design of securing the succession to herself; and with that view, had not only insinuated herself into the confidence and good graces of Galitzin, but had brought over to her interests the Strelitzes, who were the body-guard of the czars, and at this time were about fourteen thousand in number. These licentious soldiers assembled for the purpose, as was pretended, of placing on the throne Prince Ivan, whom they proclaimed czar by acclamation. During three days they roved about the city of Moscow, committing the greatest excesses, and putting to death several of the chief officers of state who were suspected of being hostile to the designs of Sophia. Their employer did not, however, entirely gain her point; for as the new czar entertained a sincere affection for his half-brother Peter, he insisted that this prince should share with him the imperial dignity. This was at length agreed to; and on the 6th of May 1682, Ivan and Peter were solemnly crowned joint emperors of all the Russias, while the Princess Sophia was nominated their copartner in the government.

History.
An. 1682
Intrigues
of the Prin-
cess Sophia.

From the imbecility of Ivan and the youth of Peter, who was now only ten years of age, the whole power of the government rested with Sophia and her minister Galitzin, although till the year 1687 the names of Ivan and Peter only were annexed to the imperial decrees. Scarcely had Sophia established her authority when she was threatened with deposition, from an alarming insurrection of the Strelitzes. This was excited by their commander Prince Kovanskoi, who had demanded of Sophia that she should marry one of her sisters to his son, but had met with a mortifying refusal. In consequence of this insurrection, which threw the whole city of Moscow into terror and consternation, Sophia and the two young czars took refuge in a monastery about twelve leagues from the capital; and before the Strelitzes could follow them thither, a considerable body of soldiers, principally foreigners, was assembled in their defence. Kovanskoi was taken prisoner, and instantly beheaded; and though his followers at first threatened dreadful vengeance on his executioners, they soon found themselves obliged to submit. From every regiment was selected the tenth man, who was to suffer as an atonement for the rest; but this cruel punishment was remitted, and only the most guilty among the ringleaders suffered death.

The quelling of these disturbances gave leisure to the friends of Peter to pursue the plans which they had formed for subverting the authority of Sophia; and about this time a favourable opportunity offered, in consequence of a rupture with Turkey. The Porte was now engaged in a war with Poland and the German empire, and both these latter powers had solicited the assistance of Russia against the common enemy. Sophia and her party were averse to the alliance; but as there were in the council many secret friends of Peter, these had sufficient influence to persuade the majority that a Turkish war would be of advantage to the state. They even prevailed on Galitzin to put himself at the head of the army, and thus removed their principal opponent. It is difficult to conceive how a man, so able in the cabinet as Galitzin, could have suffered his vanity so far to get the better of his good sense, as to accept a military command, for which he certainly had no talents. Assembling an army of nearly three hundred thousand men, he marched towards the confines of Turkey, and there consumed two campaigns in marches and countermarches, and

An. 1687.
The party
of Peter
gains
ground.

History. lost nearly forty thousand men, partly in unsuccessful skirmishes with the enemy, but chiefly from disease.

While Galitzin was thus trifling away his time in the south, Peter, who already began to give proofs of those great talents which afterwards enabled him to act so conspicuous a part in the theatre of the north, was strengthening his party among the Russian nobles. His ordinary residence was at a village not far from Moscow, and here he had assembled round him a considerable number of young men of rank and influence, whom he called his play-mates. Among these were two foreigners, Lefort a Genevese, and Gordon a Scotchman, who afterwards signalized themselves in his service. These young men had formed a sort of military company, of which Lefort was captain; and the young czar, beginning with the situation of drummer, gradually rose through every subordinate office. Under this appearance of a military game, Peter was secretly establishing himself in the affections of his young companions, and effectually lulled the suspicions of Sophia, till it was too late for her to oppose his machinations.

An. 1689
Peter obtains the undivided sovereignty.

About the middle of the year 1689, Peter, who had now attained his seventeenth year, determined to make an effort to deprive Sophia of all share in the government, and to secure to himself the undivided sovereignty. On occasion of a solemn religious meeting that was held, Sophia had claimed the principal place, as regent of the empire; but this claim was strenuously opposed by Peter, who, rather than fill a subordinate situation, quitted the place of assembly, and, with his friends and adherents, withdrew to the monastery of the Holy Trinity, which had formerly sheltered him and his copartners from the fury of the Strelitzes. This was the signal for an open rupture. Sophia, finding that she could not openly oppose the party of the czar, attempted to procure his assassination; but as her design was discovered, she thought proper to solicit an accommodation. This was agreed to, on condition that she should give up all claim to the regency, and retire to a nunnery. The commander of the Strelitzes, her agent in the assassination of Peter, was beheaded, and the minister Galitzin sent into banishment to Archangel.

He establishes a military and naval force.

Peter now saw himself in undisputed possession of the imperial throne; for though Ivan was still nominally czar, he had voluntarily resigned all share in the administration of affairs, and retired to a life of obscurity. The first object to which the czar directed his attention was the establishment of a regular and well-disciplined military force. He had learned by experience how little dependence was to be placed on the Strelitzes; and these regiments he determined to disband. He commissioned Lefort and Gordon to levy new regiments, which, in their whole constitution, dress, and military exercises, should be formed on the model of other European troops. He next resolved to carry into execution the design which had been formed by his father, of constructing a navy. For this purpose he first took a journey to Archangel, where he employed himself in examining the operations of the shipwrights, and occasionally taking a part in their labours; but as he learned that the art of ship-building was practised in greater perfection in Holland, and some other maritime countries of Europe, he sent thither several young Russians to be initiated into the best methods of constructing ships of war.

His successes against the Turks.

The war with Turkey still languished, but Peter was resolved to prosecute it with vigour, hoping to get possession of the town of Azof, and thus open a passage to the Black Sea. He placed Gordon, Lefort, and two of his nobles, at the head of the forces destined for this expedition, and himself attended the army as a private volunteer. The success of the first campaign was but trifling; and Peter learned that his deficiency of artillery and his want of transports prevented him from making an effectual attack on Azof. These difficulties, however, were soon surmounted. He

procured a supply of artillery and engineers from the emperor and the Dutch, and found means to provide a number of transports. With these auxiliaries he opened the second campaign, defeated the Turks on the Sea of Azof, and made himself master of the town. Peter was so elated with these successes, that on his return from the seat of war he marched his troops into Moscow in a triumphal procession, in which Lefort as admiral of the transports, and Schein as commander of the land forces, bore the most conspicuous parts, while Peter himself was lost without distinction in the crowd of subaltern officers.

He now resolved to form a fleet in the Black Sea; but as his own revenues were insufficient for this purpose, he issued a ukase, commanding the patriarch and other dignified clergy, the nobility, and the merchants, to contribute a part of their income towards fitting out a certain number of ships. This proclamation was extremely unpopular, and, together with the numerous innovations which Peter was every day introducing, especially his sending the young nobles to visit foreign countries, and his own avowed intention of making the tour of Europe, contributed to raise against him a formidable party. The vigilance and prudence of the czar, however, extricated him from the dangers with which he was threatened, and enabled him to carry into execution his proposed journey.

In returning to his own dominions, Peter passed through An. 1700. Rawa, where Augustus king of Poland then was. The czar had determined, in conjunction with Augustus and the king of Denmark, to take advantage of the youth and inexperience of Charles XII. who had just succeeded to the Swedish throne; and in this interview with Augustus, he made the final arrangements for the part which each was to take in the war. Augustus was to receive Livonia as his part of the spoil, while Frederick king of Denmark had his eye on Holstein, and Peter had formed designs on Ingria, formerly a province of the Russian empire.

In the middle of the year 1700, Charles had left his capital to oppose these united enemies. He soon compelled the king of Denmark to give up his designs on Holstein, and sign a treaty of peace; and being thus at liberty to turn his arms against the other members of the confederacy, he resolved first to lead his army against the king of Poland; but on his way he received intelligence that the czar had laid siege to Narva with an army which some authorities calculate at a hundred thousand men. On this he immediately embarked at Carlsrona, though it was then the depth of winter, and the Baltic was scarcely navigable; and soon landed at Pernaw in Livonia with part of his forces, having ordered the rest to Revel. His army did not exceed twenty thousand men, but it was composed of the best soldiers in Europe, while that of the Russians was little better than an undisciplined multitude. Every possible obstruction, however, had been thrown in the way of the Swedes. Thirty thousand Russians were posted in a defile on the road, and this corps was sustained by another body of twenty thousand drawn up some leagues nearer Narva. Peter himself had set out to hasten the march of a reinforcement of forty thousand men, with whom he intended to attack the Swedes in flank and rear; but the celerity and valour of Charles baffled every attempt to oppose him. He set out with four thousand foot and an equal number of cavalry, leaving the rest of the army to follow at their leisure. With this small body he attacked and defeated the Russian armies successively, and pushed his way to Peter's camp, for the attack of which he gave immediate orders. This camp was fortified by lines of circumvallation and contravallation, by redoubts, and by a line of a hundred and fifty brass cannons placed in front; and it was defended by an army of eighty thousand men; yet so violent was the attack of the Swedes, that in three hours the intrenchments were carried, and Charles, with

History.

only four thousand men, that composed the wing which he commanded, pursued the flying enemy, amounting to fifty thousand, to the river Narva. Here the bridge broke down with the weight of the fugitives, and the river was filled with their bodies. Great numbers returned in despair to their camp, where they defended themselves for a short time, but were at last obliged to surrender. In this battle, thirty thousand were killed in the intrenchments and the pursuit, or drowned in the river; twenty thousand surrendered at discretion, and were dismissed unarmed, while the rest were totally dispersed. A hundred and fifty pieces of cannon, twenty-eight mortars, a hundred and fifty-one pairs of colours, twenty standards, and all the Russian baggage, fell into the hands of the Swedes; and the Duke de Croy, the Prince of Georgia, and seven other generals, were made prisoners. Charles behaved with the greatest generosity to the conquered. Being informed that the tradesmen of Narva had refused credit to the officers whom he detained prisoners, he sent a thousand ducats to the Duke de Croy, and to every other officer a proportional sum.

Peter was advancing with forty thousand men to surround the Swedes, when he received intelligence of the dreadful defeat at Narva. He was greatly chagrined; but comforting himself with the hopes that the Swedes would in time teach the Russians to beat them, he returned to his own dominions, where he applied himself with the utmost diligence to the raising of another army. He evacuated all the provinces which he had invaded, and for a time abandoned all his great projects, thus leaving Charles at liberty to prosecute the war against Poland.

As Augustus had expected an attack, he endeavoured to draw the czar into a close alliance with him. The two monarchs had an interview at Birzen, where it was agreed that Augustus should lend the czar fifty thousand German soldiers, to be paid by Russia; that the czar should send an equal number of his troops to be trained up to the art of war in Poland; and that he should pay the king three millions of rix-dollars in the space of two years. Of this treaty Charles had notice, and, by means of his minister Count Piper, entirely frustrated the scheme.

Renewed exertions of Peter.

After the battle of Narva, Charles became confident and negligent, while the activity of Peter increased with his losses. He supplied his want of artillery by melting down the bells of the churches, and constructed numerous small vessels on the lake of Ladoga to oppose the entrance of the Swedes into his dominions. He took every advantage of Charles's negligence, and engaged in frequent skirmishes, in which, though often beaten, he was sometimes victorious. He contrived to make himself master of the river Neva, and captured Nyenschantz, a fortress at the mouth of that river. Here he laid the foundation of that city which he had long projected, and which was to become the metropolis of his empire. At length, in 1704, he became master of Ingria, and appointed his favourite Prince Menzikoff to be viceroy of that province, with strict orders to make the building of the new city his principal business. Here edifices were already rising in every quarter, and navigation and commerce were increasing in vigour and extent.

Defeat of the Swedes.

In the mean time Augustus king of Poland, though treating with Charles for the surrender of his dominions, was obliged to keep up the appearance of war, which he had neither ability nor inclination to conduct. He had been lately joined by Prince Menzikoff with 30,000 Russians; and this obliged him, contrary to his inclination, to hazard an engagement with Meyerfeldt, who commanded 10,000 men, one half of whom were Swedes. As at this time no disparity of numbers whatever was reckoned an equivalent to the valour of the Swedes, Meyerfeldt did not decline the combat, though the army of the enemy was four times as numerous as his own. Menzikoff, with his own countrymen,

defeated the enemy's first line, and was on the point of defeating the second, when Stanislas, with the Poles and Lithuanians, gave way. Meyerfeldt then perceived that the battle was lost; but he fought desperately, that he might avoid the disgrace of a defeat. At last, however, he was oppressed by numbers, and forced to surrender; suffering the Swedes for the first time to be conquered by their enemies. The whole army were taken prisoners excepting Major-general Krassau, who having repeatedly rallied a body of horse formed into a brigade, at last broke through the enemy, and escaped to Posnania. Augustus had scarcely sung *Te Deum* for this victory, when his plenipotentiary returned from Saxony with the articles of the treaty, by which he was to renounce all claim to the crown of Poland in favour of his rival Stanislas. The king hesitated and scrupled, but at last signed them; after which he set out for Saxony, glad at any expense to be freed from such an enemy as the king of Sweden, and from such allies as the Russians.

The czar Peter was no sooner informed of this extraordinary treaty, than he learned also the cruel fate of his plenipotentiary Patkul, a Livonian emigrant, whom Charles claiming as a subject, seized and executed. Peter immediately sent letters to every court in Christendom, complaining of this breach of the law of nations. He entreated the emperor, the queen of Britain, and the states-general, to revenge this insult on humanity. He stigmatized the compliance of Augustus with the opprobrious name of pusillanimity; and exhorted them not to guarantee a treaty so unjust, but to despise the menaces of the Swedish bully. So well, however, was the prowess of the king of Sweden known, that none of the allies thought proper to irritate him, by refusing to guarantee any treaty which he thought proper to accept. At first, Peter thought of revenging Patkul's death by massacring the Swedish prisoners at Moscow; but from this he was deterred, by remembering that Charles had many more Russian prisoners than he himself had of Swedes. In the year 1707, however, he entered Poland at the head of sixty thousand men, and, assembling a diet, solemnly deposed Stanislas, with the same ceremonies which had been used with regard to Augustus. The appearance of a Swedish army under King Stanislas and General Lewenhaupt put a stop to this invasion, and the czar retired into Lithuania, giving out as the cause of his retreat, that the country could not supply him with the provisions and forage necessary for so great an army.

During these transactions Charles had taken up his residence in Saxony, where he gave laws to the court of Vienna, and in a manner intimidated all Europe. At last, satiated with the glory of having dethroned one king, set up another, and struck all Europe with terror and admiration, he began to evacuate Saxony in pursuit of his great plan, the dethroning the czar Peter, and conquering the vast empire of Russia. While the army was on full march in the neighbourhood of Dresden, he took the extraordinary resolution of visiting King Augustus with no more than five attendants. Although he had no reason to imagine that Augustus either did or could entertain any friendship for him, he was not uneasy at the consequences of thus putting himself entirely in his power. He reached the palace door of Augustus before it was known that he was in the city; and he entered the elector's chamber in his boots before the latter had time to recover from his surprise. He breakfasted with him in a friendly manner, and then expressed a desire of viewing the fortifications. While he was walking round them, a Livonian, who had formerly been condemned in Sweden, and served in the troops of Saxony, thought he could never have a more favourable opportunity of obtaining pardon. He therefore begged of King Augustus to intercede for him, being fully assured that his majesty could not refuse so small a favour to a prince in whose power he then was. Augustus accordingly made the request, but Charles refused

History.

Peter determines to continue the war.

Charles visits Augustus.

History. it in such a manner that he did not think proper to ask it a second time. Having passed some hours in this extraordinary visit, he returned to his army, after having embraced and taken leave of the king he had dethroned.

Remarques against the Russians. The armies of Sweden, in Saxony, Poland, and Finland, now exceeded seventy thousand men; while the available force of Russia amounted to about a hundred thousand. Peter, who had his army dispersed in small parties, instantly assembled it on receiving notice of the king of Sweden's march, was making all possible preparations for a vigorous resistance, and was on the point of attacking Stanislas, when the approach of Charles struck his whole army with terror. In the month of January 1708, Charles passed the Niemen, and entered the south gate of Grodno just as Peter was quitting the place by the north gate. Charles at this time had advanced some distance before the army, at the head of six hundred horse.

The Russians again defeated. The czar having received intelligence of his situation, sent back a detachment of two thousand men to attack him; but these were entirely defeated, and thus Charles became possessed of the whole province of Lithuania. The king pursued his flying enemies in the midst of ice and snow, over mountains, rivers, and morasses, and through obstacles which appeared to be insurmountable. These difficulties, however, he had foreseen, and had prepared to meet them. As he knew that the country could not furnish provisions sufficient for the subsistence of his army, he had provided a large quantity of biscuit, and on this his troops chiefly subsisted, till they came to the banks of the Beresina, in view of Borisow. Here the czar was posted, and Charles intended to give him battle, after which he could the more easily penetrate into Russia. Peter, however, did not think proper to come to an action, but retreated towards the Dnieper, whither he was pursued by Charles, as soon as he had refreshed his army. The Russians had destroyed the roads and desolated the country, yet the Swedish army advanced with great celerity, and in their march defeated twenty thousand Russians, though intrenched to the very teeth. This victory, from the circumstances in which it was gained, was one of the most glorious that ever Charles had achieved. The memory of it was preserved by a medal struck in Sweden with this inscription; *Sylvæ, paludes, aggeres, hostes, victi.*

Peter attempts to make peace, but is unsuccessful. When the Russians had repassed the Dnieper, the czar, finding himself pursued by an enemy with whom he could not cope, resolved to make proposals for an accommodation. Charles made only this arrogant reply, "I will treat with the czar at Moscow;" a taunt which was received by Peter with the coolness of a hero. "My brother Charles," said he, "affects to play the Alexander, but he shall not find in me a Darius." He still, however, continued his retreat, and Charles pursued so closely that daily skirmishes took place between his advanced guard and the rear of the Russians. In these actions the Swedes had generally the advantage, though their petty victories cost them dear, by contributing to weaken their force in a country where it could not be recruited. The two armies came so close to each other at Smolensk, that an engagement took place between a body of Russians composed of ten thousand cavalry and six thousand Kalmuks, and the Swedish vanguard, composed of only six regiments, but commanded by the king in person. Here the Russians were again defeated; but Charles, having been separated from the main body of his detachment, was exposed to great danger. With one regiment only he fought with such fury as to drive the enemy before him, when they thought themselves sure of making him prisoner.

An. 1708. Charles advances towards Moscow. By the 3d of October 1708, Charles had approached within a hundred leagues of Moscow; but Peter had rendered the roads completely impassable, and had destroyed the villages on every side, so as to cut off every possibility of

subsistence to the enemy, while the season was far advanced, and the severity of winter was approaching. In these circumstances, the king, at length sensible that he had committed a perilous mistake, endeavoured to retrieve it by a step which proved yet more calamitous. He resolved, before attacking the Russian capital, to achieve the conquest of the Ukraine, where Mazeppa, a Polish gentleman, was general and chief of the Kozaks. Mazeppa having been affronted by the czar, readily entered into a treaty with Charles, whom he promised to assist with thirty thousand men, great quantities of provisions and ammunition, and with all his treasures, which were falsely stated to be immense. The Swedish army advanced towards the river Disna, where they had to encounter the greatest difficulties; a forest above forty leagues in extent, filled with rocks, mountains, and morasses. To complete their misfortunes, they were led thirty leagues out of the right way; all the artillery was sunk in bogs and marshes; the provision of the soldiers, which consisted of biscuit, was exhausted; and the whole army were spent and emaciated when they arrived at the Disna. Here they expected to have met Mazeppa with his reinforcement; but instead of that, they perceived the opposite banks of the river covered with a hostile army, and the passage itself rendered almost impracticable. Charles, however, was still undaunted; he let his soldiers by ropes down the steep banks; they crossed the river either by swimming, or on rafts hastily put together, drove the Russians from their post, and continued their march. Mazeppa soon after appeared, having with him about six thousand men, the broken remains of the army he had promised. The Russians had got intelligence of his designs, defeated and dispersed his adherents, laid his town in ashes, and taken all the stores collected for the Swedish army. However, he still hoped to be useful by his intelligence in an unknown country; and the Kozaks, out of revenge, crowded daily to the camp with provisions.

History. Greater misfortunes still awaited the Swedes. When Charles entered the Ukraine, he had sent orders to General Lewenhaupt to meet him with fifteen thousand men, six thousand of whom were Swedes, and a large convoy of provisions. Against this detachment Peter now bent his whole force, and marched against him with an army of sixty-five thousand men. Lewenhaupt had received intelligence that the Russian army consisted of only twenty-four thousand, a force to which he thought six thousand Swedes superior, and therefore disdained to intrench himself. A furious contest ensued, in which the Russians were defeated with the loss of fifteen thousand men. Now, however, affairs began to take another turn. The Swedes, elated with victory, prosecuted their march into the interior; but, from the ignorance or treachery of their guides, they were led into a marshy country, where the roads were made impassable by felled trees and deep ditches. Here they were attacked by the czar with his whole army. Lewenhaupt had sent a detachment to dispute the passage of a body of Russians over a morass; but finding his detachment likely to be overpowered, he marched to support them with all his infantry. Another desperate battle ensued. The Russians were once more thrown into disorder, and were just on the point of being totally defeated, when Peter gave orders to the Kozaks and Kalmuks to fire upon all that fled; "Even kill me," said he, "if I should be so cowardly as to turn my back." The battle was now renewed with great vigour; but notwithstanding the czar's positive orders, and his own example, the day would have been lost, had not General Bauer arrived with a strong reinforcement of fresh Russian troops. The engagement was once more renewed, and continued without intermission till night. The Swedes then took possession of an advantageous post, but were next morning attacked by the

History.

Russians. Lewenhaupt had formed a sort of rampart with his waggons, but was obliged to set fire to them to prevent their falling into the hands of the Russians, while he retreated under cover of the smoke. The czar's troops, however, arrived in time to save five hundred of these waggons, filled with provisions destined for the distressed Swedes. A strong detachment was sent to pursue Lewenhaupt; but so terrible did he now appear, that the Russian general offered him an honourable capitulation. This was rejected with disdain, and a fresh engagement took place in which the Swedes, now reduced to four thousand, again defeated their enemies, and killed five thousand on the spot. After this Lewenhaupt was allowed to pursue his retreat without molestation, though deprived of all his cannon and provisions. Prince Menzikoff was indeed detached with a body of forces to harass him on his march; but the Swedes were now so formidable, even in their extremity, that Menzikoff dared not to attack them, so that Lewenhaupt with his four thousand men arrived safe in the camp of Charles, after having destroyed nearly thirty thousand of the Russians.

This may be said to have been the last successful effort of Swedish valour against the troops of Peter. The difficulties which Charles's army had now to undergo exceeded what human nature could support; yet still they hoped by constancy and courage to subdue them. In the severest winter known for a long time, even in Russia, they made long marches, clothed like savages in the skins of wild beasts. All the draught-horses perished; thousands of soldiers dropt down dead through cold and hunger; and by the month of February 1709 the whole army was reduced to eighteen thousand. Amidst numberless difficulties these penetrated to Pultava, a town on the eastern frontier of the Ukraine, where the czar had laid up magazines, of which Charles resolved to obtain possession. Mazeppa advised the king to invest the place, in consequence of his having correspondence with some of the inhabitants, by whose means he hoped it would be surrendered. He was, however, deceived. The besieged made an obstinate defence; the Swedes were repulsed in every assault, and eight thousand of them were defeated, and almost entirely cut off, in an engagement with a party of Russians. To complete his misfortunes, Charles received a shot in his heel from a carabine, which shattered the bone. For six hours afterwards, he continued calmly on horseback, giving orders, till he fainted with the loss of blood; after which he was carried into his tent.

Battle of
Pultava.

For some days the czar, with an army of seventy thousand men, had lain at a small distance, harassing the Swedish camp, and cutting off the convoys of provision; but now intelligence was received that he was advancing as if with a design of attacking the lines. In this situation, Charles, wounded, distressed, and almost surrounded by enemies, is said to have, for the first time, assembled a grand council of war, the result of which was, that it was determined to march out and attack the Russians. Voltaire, however, asserts that the king did not relax one iota of his wonted obstinacy and arbitrary temper; but that, on the 7th of July, he sent for General Renschild, and told him, without any emotion, to prepare for attacking the enemy next morning.

The 8th of July 1709 is remarkable for the battle which decided the fate of Sweden. Charles, having left eight thousand men in the camp to defend the works and repel the sallies of the besieged, began by break of day to march against his enemies with the rest of the army, consisting of twenty-six thousand men, of whom eighteen thousand were Kozaks. The Russians were drawn up in two lines behind their intrenchments, the horse in front, and the foot in the rear, with chasms to suffer the horse to fall back in case of necessity. General Slippenbach was despatched to attack the cavalry, which he did with such impetuosity that they were broken in an instant. They, however, rallied behind the infantry, and returned to the charge with so much vigour,

that the Swedes were disordered in their turn, and Slippenbach was made prisoner. Charles was now carried in his litter to the scene of confusion. His troops, re-animated by the presence of their leader, returned to the charge, and the battle became doubtful, when a blunder of General Creuk, who had been despatched by Charles to take the enemy in flank, and a successful manœuvre of Prince Menzikoff, decided the fortune of the day in favour of the Russians. Creuk's detachment was defeated, and Menzikoff, who had been sent by Peter with a strong body to post himself between the Swedes and Pultava, so as to cut off the communication of the enemy with their camp, and fall upon their rear, executed his orders with so much success as to intercept a corps de reserve of three thousand men. Charles had ranged his remaining troops in two lines, with the infantry in the centre, and the horse on the two wings. They had already twice rallied, and were now again attacked on all sides with the utmost fury. Charles in his litter, with a drawn sword in one hand, and a pistol in the other, seemed to be everywhere present; but new misfortunes awaited him. A cannon-ball killed both horses in the litter; and scarcely were these replaced by a fresh pair, when a second ball struck the litter in pieces, and overturned the king. The Swedish soldiers, believing him killed, fell back in consternation. The first line was completely broken, and the second fled. Charles, though disabled, did every thing in his power to restore order; but the Russians, emboldened by success, pressed so hard on the flying foe, that it was impossible to rally them. Renschild and several other general officers were taken prisoners, and Charles himself would have shared the same fate, had not Count Poniatowski, father of the future favourite of Catherine II., with five hundred horse, surrounded the royal person, and with desperate fury cut his way through ten regiments of the Russians. With this small guard the king arrived on the banks of the Dnieper, and was followed by Lewenhaupt with four thousand foot and all the remaining cavalry. The Russians took possession of the Swedish camp, where they found a prodigious sum in specie; while Prince Menzikoff pursued the flying Swedes, and, as they were in want of boats to cross the Dnieper, obliged them to surrender at discretion. Charles escaped with the utmost difficulty, but at length reached Otchakof, on the frontiers of Turkey.

By this decisive victory, Peter remained in quiet possession of his new acquisitions on the Baltic, and was enabled to carry on, without molestation, the improvements which he had projected at the mouth of the Neva. His haughty rival, so long and so justly dreaded, was now completely humbled, and his ally the king of Poland was again established on his throne. During the eight years that had elapsed from the battle of Narva to that of Pultava, the Russian troops had acquired the discipline and steadiness of veterans, and had at length learned to beat their former conquerors. If Peter had decreed triumphal processions for his trifling successes at Azof, it is not surprising that he should commemorate by similar pageants a victory so glorious and so important as that of Pultava. He made his triumphal entry into Moscow for the third time, and the public rejoicings on this occasion far exceeded all that had before been witnessed in the Russian empire.

The vanquished Charles had, in the mean time, found a valuable friend in the monarch in whose territories he had taken refuge. Achmet II. who then filled the Ottoman throne, had beheld with admiration the warlike achievements of the Swedish hero; and, alarmed at the late successes of his rival, determined to afford Charles the most effectual aid. In 1711, the Turkish emperor assembled an immense army, and was preparing to invade the Russian territories, when the czar, having intimation of his design, and expecting powerful support from Cantemir, hospodar of Moldavia, a vassal of the Porte, resolved to anticipate the

AD. 1711.
Dangerous
situation of
Peter at
the Pruth.

History. Turks, and to make an inroad into Moldavia. Forgetting his usual prudence and circumspection, Peter crossed the Dnieper, and advanced by rapid marches as far as Yassy or Jassy, the capital of that province, which is situated on the river Pruth; but his temerity had nearly cost him his liberty, if not his life. From this dangerous situation he was extricated by the tact of his consort the Czarina Catherine, who by a liberal bribe succeeded in gaining over the grand vizier to her interests, and thus brought about the treaty of the Pruth.

An. 1721. By this treaty, in which the interests of Charles had been almost abandoned, Peter saw himself delivered from a dangerous enemy, and returned to his capital to prosecute those plans for the internal improvement of his empire which justly entitled him to the appellation of Great. Before we enumerate these improvements, however, we must bring the Swedish war to a conclusion. The death of Charles, in 1718, had left the Swedish government deplorably weakened, by the continual drains of men and money occasioned by his mad enterprises, and little able to carry on a war with a monarch so powerful as Peter. At length, therefore, in 1721, this ruinous contest, which had continued ever since the commencement of the century, was brought to a conclusion by the treaty of Nystadt, by which the Swedes were obliged to cede to Russia, Livonia, Esthonia, Ingria, a part of Karelia, the territory of Vyborg, the isle of Oesel, and all the other islands in the Baltic, from Courland to Vyborg; for which concessions they received back Finland, that had been conquered by Peter, together with two millions of dollars, and the liberty of exporting duty free, from Riga, Revel, and Arensburg, corn to the annual amount of fifty thousand roubles. In consequence of this great accession to the Russian empire, Peter received from his senate the title of Emperor and Autocrat of all the Russias, and the ancient title of czar fell into disuse.

Peter's national improvements. The improvements introduced by Peter into the internal policy of the empire must be acknowledged to have been numerous and important. He organized anew the legislative assembly of the state; he greatly ameliorated the administration of justice; he new-modelled the national army; he entirely created the Russian navy; he rendered the ecclesiastical government milder and less intolerant; he zealously patronized the arts and sciences; he erected an observatory at St Petersburg, and by publicly proclaiming the approach of an eclipse, and the precise time at which it was to take place, taught his subjects no longer to consider such a phenomenon as an omen of disaster, or an awful menace of divine judgment. He enlarged the commerce of his empire, and gave every encouragement to trade and manufactures. He formed canals, repaired the roads, instituted regular posts, and laid down regulations for a uniformity of weights and measures. Lastly, he in some measure civilized his subjects, though it is evident that he could not civilize himself.

Character of Peter. Various have been the estimates formed of the character of Peter by those who have detailed the events of his reign. It is certain that to him the Russian empire is greatly indebted for the position which she now occupies among the nations of Europe. As a monarch, therefore, he is entitled to our admiration; but as a private individual we must consider him as an object of detestation and abhorrence. His tyranny and his cruelty admit of no excuse; and if we were to suppose, that in sacrificing the heir of his crown he emulated the patriotism of the elder Brutus, we must remember that the same hand which signed the death-warrant of his son, could with pleasure execute the sentence of the law, or rather of his own caprice, and, in the moments of dissipation and revelry, could make the axe of justice an instrument of diabolical vengeance or of cool brutality.

Peter was succeeded by his consort Catherine, in whose favour he had, some years before his death, altered the or-

History. As the character of this princess, and the transactions of her short reign, have been already detailed under her life, we shall here only notice in the most cursory manner the events that took place. From the commencement of her reign, Catherine conducted herself with the greatest benignity and gentleness, and thus secured the love and veneration of her subjects, which she had acquired during the life of the emperor. She reduced the annual capitation tax; ordered the numerous gibbets which Peter had erected in various parts of the country to be cut down; and caused the bodies of those who had fallen victims to his tyranny to be decently interred. She recalled the greater part of those whom Peter had exiled to Siberia; paid the troops their arrears; and restored to the Kozaks those privileges and immunities of which they had been deprived during the late reign, while she continued in office most of the servants of Peter, both civil and military. In her reign the boundaries of the empire were extended by the submission of a Georgian prince, and the voluntary homage of the Kubinskian Tartars. She died on the 17th of May 1727, having reigned about two years. She had settled the crown on Peter the son of the Czarovitch Alexei, who succeeded by the title of Peter II.

An. 1727. Peter was only twelve years of age when he ascended the imperial throne, and his reign was short and uninteresting. He was guided chiefly by Prince Menzikoff, whose daughter Catherine had decreed him to marry. This ambitious man, who, from the mean condition of a pye-boy, had risen to the first offices of the state, and had, during the late reign, principally conducted the administration of the government, was now, however, drawing towards the end of his career. The number of his enemies had greatly increased, and their attempts to work his downfall at last succeeded. A young nobleman of the family of the Dolgoruki, who was one of Peter's chief companions, was excited by his relations, and the other enemies of Menzikoff, to instil into the mind of the young prince feelings hostile to that minister. In this commission he succeeded so well, that Menzikoff and his whole family, not excepting the young empress, were banished to Siberia, and the Dolgorukis took into their hands the management of affairs. These artful counsellors, instead of cultivating the naturally good abilities of Peter, encouraged him to waste his time and exhaust his strength in hunting and other athletic exercises, for which his tender years were by no means calculated. It is supposed that the debility consequent on such fatigue increased the natural danger of the small-pox, with which he was attacked in January 1730, and from which he never recovered.

An. 1730. Notwithstanding the absolute power with which Peter I. and the Empress Catherine had settled by will the title Anne to the throne, the Russian senate and nobility, upon the death of Peter II. ventured to set aside the order of succession which those sovereigns had established. The male issue of Peter was now extinct; and the Duke of Holstein, son to Peter's eldest daughter, was by the destination of the late empress entitled to the crown; but the Russians, for political reasons, filled the throne with Anne duchess of Courland, second daughter to Ivan, the eldest brother of Peter, though her eldest sister, the Duchess of Mecklenburg, was still alive. Anne's reign was extremely prosperous; and though she accepted the crown under limitations which some thought derogatory to her dignity, yet she broke them all, asserted the prerogative of her ancestors, and punished the aspiring Dolgoruki family, who had imposed those restrictions, with a view, as it is said, that they themselves might govern. She raised her favourite Biren to the duchy of Courland; and was obliged to give way to many severe executions on his account. Few transactions of any importance took place during the reign of Anne. She followed the example of her great predecessor Peter, by interposing in the affairs of Poland, where she

History. had sufficient interest to establish on the throne Augustus III. She entered into a treaty with the shah of Persia, by which she agreed to give up all title to the territories that had been seized by Peter I. on the shores of the Caspian, in consideration of certain privileges to be granted to the Russian merchants.

In 1735, a rupture took place between Russia and Turkey, occasioned partly by the mutual jealousies that had subsisted between these powers ever since the treaty on the Pruth, and partly by the depredations of the Tartars of the Crimea, then under the dominion of the Porte. A Russian army entered the Crimea, ravaged part of the country, and killed a considerable number of Tartars; but having ventured too far, without a sufficient supply of provisions, it was obliged to retreat, after sustaining a loss of nearly ten thousand men. This ill success did not discourage the court of St Petersburg; and in the following year another armament was sent into the Ukraine, under the command of Marshal Munnich, while another army under Lascy proceeded against Azof. Both these generals met with considerable success; the Tartars were defeated, and the fort of Azof once more submitted to the Russian arms. A third campaign took place in 1737, and the Russians were now assisted by a body of Austrian troops. Munnich laid siege to Otchakof, which soon surrendered, while Lascy desolated the Crimea.

No material advantages were, however, gained upon either side; and disputes arose between the Austrian and Russian generals. At length, in 1739, Marshal Munnich, having crossed the Bog at the head of a considerable army, defeated the Turks in a pitched battle near Stavutshan; made himself master of Yassy, the capital of Moldavia; and before the end of the campaign reduced the whole of that province under his subjection. These successes of the Russian arms induced the Porte to propose terms of accommodation; and in the end of 1739 a treaty was concluded, by which Russia again gave up Azof and Moldavia, and, to compensate the loss of above a hundred thousand men, and vast sums of money, gained nothing but permission to build a fortress on the Don.

An. 1740. Upon the death of Anne, which took place in 1740, Ivan, the son of her niece the Princess of Mecklenburg, was, by her will, entitled to the succession; but as he was no more than two years old, Biren was appointed to be administrator of the empire during his minority. This nomination was disagreeable to the emperor's father and mother, and unpopular among the Russians. Count Munnich was employed by the princess to arrest Biren, who was tried and condemned to die, but was sent into exile to Siberia.

The administration of the Princess Anne of Mecklenburg and her husband was upon many accounts disagreeable, not only to the Russians, but to other powers of Europe; and the Princess Elizabeth, daughter of Peter the Great by Catherine, formed such a party, that in one night's time she was proclaimed empress of the Russias, and the Princess of Mecklenburg, her husband, and son, were made prisoners. The fate of this unhappy family was peculiarly severe. All but Ivan were sent into banishment, to an island at the mouth of the Dvina, in the White Sea, where the Princess Anne died in childhood in the year 1747. Ivan's father survived till 1775, and at last ended his miserable career in prison. The young emperor Ivan was for some time shut up in a monastery at Oranienburg, when, on attempting to escape, he was removed to the castle of Schluselburg, where he was cruelly put to death.

An. 1741. The chief instrument in rousing the ambition of Elizabeth, and procuring her elevation to the throne, was her physician and favourite Lestocq, who, partly by his insinuating address, and partly by the assistance of French gold, brought over to Elizabeth's interest most of the royal guards. During the short regency of Anne of Mecklenburg,

a new war had commenced between Russia and Sweden; and this war was carried on with considerable acrimony and some success by Elizabeth. The Russian forces took possession of Abo, and made themselves masters of nearly all Finland. But at length, in 1743, in consequence of the negotiations that were carrying on regarding the succession to the Swedish crown, a peace was concluded between the two powers, on the condition that Elizabeth should restore the greater part of Finland.

Soon after her accession, Elizabeth determined to nominate her successor to the imperial throne, and had fixed her eyes on Charles Peter Ulrich, son of the Duke of Holstein-Gottorp, by Anne, daughter of Peter the Great. This prince was accordingly invited into Russia, persuaded to become a member of the Greek church, and proclaimed Grand Duke of Russia, and heir of the empire. The ceremony of his baptism was performed on the 18th of November 1742, when he received the name of Peter Feodorovitch. He was at this time only fourteen years of age; but before he had attained his sixteenth year, his aunt had destined him a consort in the person of Sophia Augusta Frederica, daughter of Christian Augustus prince of Anhalt-Zerbst-Dornburg. This princess, on entering the Greek church, took the name of Catherine which she afterwards bore on the throne.

Having thus settled the order of succession, Elizabeth began to take an active part in the politics of Europe. The death of Charles VI. emperor of Germany, had left his daughter, Maria Theresa queen of Hungary, at the mercy of the enterprising king of Prussia, till a formidable party was organized in her behalf. To this confederacy the empress of Russia acceded, and in 1747 sent a considerable body of troops into Germany, to the assistance of the empress-queen. The events of this long and bloody contest have been fully detailed in the article PRUSSIA. The more private transactions of the court of St Petersburg, as far as they are connected with the intrigues of her niece Catherine and the follies of the Grand Duke Peter, have also been related in our life of CATHERINE II., or they will be found at greater length in the recently (1859) published *Memoirs of Catherine II.*, said with every appearance of truth to have been written by herself, and extending from her birth in 1729 to 1759. Elizabeth died on the 5th of January 1762, the victim of disease brought on by intemperance.

The grand duke ascended the throne by the name of Peter III. He entered on the government possessed of an enthusiastic admiration of the virtues of the King of Prussia, with whom he immediately made peace. He is said to have aimed at reforms which Peter the Great durst not attempt; and to have even ventured to cut off the beards of his clergy. He was certainly a weak man, who had no opinions of his own, but childishly adopted the sentiments of any person who took the trouble to teach him. His chief amusement was buffoonery; and he would sit for hours looking with pleasure at a merry-andrew singing drunken and vulgar songs. He was a stranger to the country, its inhabitants, and their manners; and suffered himself to be persuaded by those about him that the Russians were fools and beasts unworthy of his attention, except to make them, by means of the Prussian discipline, good fighting machines.

Becoming attached to a lady of the noble family of Vorontzoff, he disgusted his wife, who was then a beautiful woman in the prime of life, of great natural talents and great acquired accomplishments; whilst the lady whom he preferred to her was but one degree above an idiot. The Princess Dashkoff, the favourite's sister, who was married to a man whose genius was not superior to that of the emperor, being *dame d'honneur* and lady of the bed-chamber, had of course much of the empress's company. Similarity of situations knit these two illustrious personages in the

History.

Elizabeth engages in the Seven Years' War.

An. 1762. Accession of Peter III.

It is imprudences.

History. closest friendship. The princess, being a zealous admirer of the French *économistes*, could make her conversation both amusing and instructive. She retailed all her statistical knowledge; and finding the empress a willing hearer, she spoke of her in every company as a prodigy of knowledge, judgment, and philanthropy. Whilst the emperor, by his buffoonery and attachment to foreign manners, was daily incurring more and more the hatred of his subjects, the popularity of his wife was rapidly increasing; and some persons about the court expressed their regret that so much knowledge of government, such love of humanity, and such ardent wishes for the prosperity of Russia, should only furnish conversations with Catharina Romanovna (the Princess Dashkoff). The empress and her favourite did not let these expressions pass unobserved, but continued their studies in concert; and whilst the former was employed on her famous code of laws for a great empire, the latter always reported progress, till the middling circles of Moscow and St Petersburg began to speak familiarly of the blessings which they might enjoy if these speculations could be realized.

Meanwhile Peter III. was giving fresh cause of discontent. He had recalled from Siberia Count Munnich, who was indeed a sensible, brave, and worthy man; but Munnich, as he was smarting under the effects of Russian despotism, and had grounds of resentment against most of the great families, did not much discourage the emperor's unpopular conduct, trying only to moderate it and give it a system. Peter, however, was impatient. He publicly ridiculed the exercise and evolutions of the Russian troops; and hastily adopting the Prussian discipline, without digesting and fitting it for the constitution of his own forces, he completely ruined himself by disgusting the army.

Catherine forms a party in her favour.

In the midst of these imprudences, indeed, Peter was sometimes disturbed by the advice of virtuous counsellors. But these remonstrances produced only a temporary gleam of reformation, and he soon relapsed into his accustomed sensuality. What he lost in popularity was gained by the emissaries of Catherine. Four regiments of guards, amounting to eight thousand men, were speedily brought over by the three brothers Orlof, who had contrived to ingratiate themselves with their officers. The people at large were in a state of indifference, out of which they were partially roused by the following means. A little manuscript was handed about, containing principles of legislation for Russia, founded on natural rights, and on the claims of the different classes of people, which, insensibly formed, became so familiar as to appear natural. In that performance was proposed a convention of deputies from all the classes, and from every part of the empire, to converse, but without authority, on the subjects of which it treated, and to inform the senate of the result of their deliberations. It passed for the work of her majesty, and was much admired.

While Catherine was thus high in the public esteem and affection, the emperor took the alarm at her popularity, and in a few days came to the resolution of confining her for life, and then of marrying his favourite. The servants of that lady betrayed her to her sister, who imparted the intelligence to the empress. Catherine saw her danger, and instantly formed her resolution. She must either tamely submit to perpetual imprisonment, and perhaps a cruel and ignominious death, or contrive to hurl her husband from his throne. No other alternative was left her, and the consequence was what was undoubtedly expected. The proper steps were taken. Folly fell before abilities and address, and in three days the revolution was accomplished.

Peter dethroned and put to death.

When the emperor saw that all was lost, he attempted to enter Cronstadt from Oranienbaum, a town on the Gulf of Finland, thirty versts, or nearly twenty-six miles, from St Petersburg. The sentinels at the harbour presented their muskets at the barge; and though they were not loaded, and the men had no cartridges, he drew back.

History. Munnich received him again, and exhorted him to mount his horse and head his guards, swearing to live and die with him. He said, "No, I see it cannot be done without shedding much of the blood of my brave Holsteiners. I am not worthy of the sacrifice."

Six days had already elapsed since the revolution, and that great event had been apparently terminated without any violence that might leave odious impressions upon the mind of the public. Peter had been removed from Peterhof to a pleasant retreat called Ropscha, about thirty miles from St Petersburg; and here he supposed he should be detained but a short time previous to his being sent into Germany. He therefore transmitted a message to Catherine, desiring permission to have for his attendant a favourite negro, and that she would send him a dog, of which he was very fond, together with his violin, a bible, and a few romances; telling her that, disgusted with the wickedness of mankind, he was resolved henceforth to devote himself to a philosophical life. However reasonable these requests, not one of them was granted, and his plans of wisdom were turned into ridicule.

In the mean time the soldiers were amazed at what they had done. They could not conceive by what fascination they had been hurried so far as to dethrone the grandson of Peter the Great, in order to give his crown to a German woman. The majority, without plan or consciousness of what they were doing, had been mechanically led on by the movements of others; and each individual now reflecting on his baseness, after the pleasure of disposing of a crown had vanished, was filled only with remorse. The sailors, who had never been engaged in the insurrection, openly reproached the guards in the tippling-houses with having sold their emperor for beer. One night a band of soldiers attached to the empress took the alarm, from an idle fear, and exclaimed that their mother was in danger, and that she must be awaked, that they might see her. During the next night there was a fresh commotion more serious than the former. So long as the life of the emperor left a pretext for inquietude, it was thought that no tranquillity was to be expected.

On the sixth day of the emperor's imprisonment at Ropscha, Alexei Orlof, accompanied by an officer named Teploff, came to him with the news of his speedy deliverance, and asked permission to dine with him. According to the custom of that country, wine glasses and brandy were brought previous to dinner; and while the officer amused the czar with some trifling discourse, his chief filled the glasses, and poured a poisonous mixture into that which he intended for the prince. The czar, without any distrust, swallowed the potion, on which he immediately experienced the most severe pains; and on his being offered a second glass, on pretence of its giving him relief, he refused it, with reproaches against him that offered it. He called aloud for milk, but the two monsters offered him poison again, and pressed him to take it. A French valet-de-chambre, greatly attached to him, now ran in. Peter threw himself into his arms, saying in a faint tone of voice, "It was not enough, then, to prevent me from reigning in Sweden, and to deprive me of the crown of Russia. I must also be put to death."

The valet-de-chambre presumed to intercede for his master; but the two miscreants forced this dangerous witness out of the room, and continued their ill treatment of the czar. In the midst of this tumult the younger of the Princes Baratinsky came in, and joined the two former. Orlof, who had already thrown down the emperor, was pressing upon his breast with both his knees, and firmly gripping his throat with his hand. The unhappy monarch now struggling with that strength which arises from despair, the two other assassins threw a napkin round his neck, and put an end to his life by suffocation.

History.

It is not known with certainty what share the empress had in this event; but it is affirmed that on the very day on which it happened, while the empress was beginning her dinner with much gaiety, an officer, supposed to be one of the assassins, precipitately entered the apartment with his hair dishevelled, his face covered with sweat and dust, his clothes torn, and his countenance agitated with horror and dismay. On entering, his eyes, sparkling and confused, met those of the empress. She arose in silence, and went into a closet, whither he followed her. A few moments afterwards she sent for Count Panin, the former governor of Peter, who was already appointed her minister, and, informing him that the emperor was dead, consulted him on the manner of announcing his death to the public. Panin advised her to let one night pass over, and to spread the news next day, as if they had received it during the night. This counsel being approved, the empress returned with the same countenance, and continued her dinner with the same gaiety. On the day following, when it was published that Peter had died of an hæmorrhoidal colic, she appeared bathed in tears, and proclaimed her grief by an edict.

The corpse was brought to St Petersburg, there to be exposed. The face was black, and the neck excoriated. Notwithstanding these horrible marks, in order to assuage the commotions, which began to excite apprehension, and to prevent impostors from hereafter disturbing the empire, it was left three days exposed to all the people, with only the ornaments of a Holstein officer. The soldiers, disbanded and disarmed, mingled with the crowd, and as they beheld their sovereign, their countenances indicated a mixture of compassion, contempt, and shame. They were soon afterwards embarked for their country; but, as the sequel of their cruel destiny, almost all of these unfortunate men perished in a storm. Some of them had saved themselves on the rocks adjacent to the coast; but they again fell a prey to the waves, while the commandant of Cronstadt despatched a messenger to St Petersburg to know whether he might be permitted to assist them. Thus fell the unhappy Peter III. in 1762, in the thirty-fourth year of his age, after having enjoyed the imperial dignity only six months.

Catherine II. ascends the imperial throne.

On her accession, Catherine behaved with great magnanimity and forbearance towards those who had opposed her elevation, or were the declared friends of the deceased emperor. She gave to Prince George, in exchange for his title of Duke of Courland, conferred on him by Peter, the government of Holstein. She reinstated Biren in his dukedom of Courland, received into favour Marshal Munnich, who had readily transferred his fidelity from the dead to the living, and even pardoned her rival the Countess Vorontzoff, and permitted her to retain the tokens of her lover's munificence. She permitted Gudovitch, who was high in the confidence of Peter, and had incurred her particular displeasure, to retire to his native country. Perhaps the most unexpected part of her conduct towards the friends of Peter, was her adhering to the treaty of peace which that monarch had concluded with the king of Prussia six months before. The death of his inveterate enemy Elizabeth had relieved Frederick from a load of solicitude, and had extricated him from his dangerous situation. He now, as he thought, saw himself again involved in a war with the same formidable power; but, to his great joy, he found that Catherine, from motives of policy, declined entering on a war at the commencement of her reign.

An. 1764. Assassination of the young prince Ivan was confined in the castle of Schlusselburg, from which Peter III. had expressed a resolution to release him. Not long after her accession, this unfortunate prince was assassinated, though whether this event was to be imputed to the empress or her counsellors, cannot

be positively determined. But a manifesto published by the court of St Petersburg, and supposed to have been written by the empress herself, admitted that the prince was put to death by the officers of his guard, alleging that this was necessary, in consequence of an attempt to carry him off.

History.

Were we to offer a detailed account of the principal transactions that took place during the long reign of Catherine, we should far exceed the limits within which this article must be confined, and should at the same time repeat much of what has already been given under other heads. As the events that distinguished the life of Catherine, however, are too important to be wholly omitted, we shall present our readers with the following chronological sketch of them, referring for a more particular account to Tooke's Life of Catherine II., and to the articles CATHERINE II., BRITAIN, FRANCE, POLAND, PRUSSIA, SWEDEN, and TURKEY, in this work.

The year 1766 presented at St Petersburg the grandest spectacle that perhaps was ever seen in Europe. At an entertainment, which the empress chose to name a carousal, the principal nobility appeared in the most sumptuous dresses, sparkling with diamonds, and mounted on horses richly caparisoned, in a magnificent theatre erected for that purpose. Here all that has been read of the ancient jousts and tournaments was realized and exceeded in the presence of thousands of spectators, who seemed to vie with each other in the brilliancy of their appearance.

In 1768, the empress composed instructions for a new code of laws for her dominions; and the same year she submitted to the danger of inoculation, in order that her subjects, to whom the practice was unknown, might be benefited by her example.

An. 1768. Establishment of a code of laws.

In the same year a war broke out with the Ottoman Porte. The various events of this long and important conflict, which continued for seven years, must here be only briefly enumerated, as they will hereafter be more particularly noticed under the article TURKEY. In this war our countryman Greig, then an admiral in the Russian service, highly distinguished himself by his conduct in a naval engagement with the Turks, in the harbour of Tschesme, in the Archipelago, in which the Turkish fleet was entirely defeated, and their magazines destroyed. This took place on the 4th of November 1772.

War with the Turks.

In the beginning of the year 1769, the khan of the Crimea made an attack on the territory of Bachmut, on the river Bog, where he was several times bravely repulsed, with his army of Tartars and Turks, by Major-General Romanus and Prince Proserofskoi. At the same time were fought the battles of Zekanofca and Soroca on the Dnieper, when the large magazines of the enemy were burned. In February the Polish Kozaks in the voyvodship of Bracław put themselves under the Russian sceptre. In the same month the Nisovian Saparogian Kozaks gained a battle in the deserts of Krim. In March the Polish rebels were subdued, and their town taken, by Major-General Ismailoff. On the 2d of April the fort of Taganrog, on the Sea of Azof, was taken. On the 15th the Russian army, under the general-in-chief Prince Galitzin, crossed the Dniester. On the 19th a victory was gained by Prince Galitzin near Chotzim. On the 21st the Turks were defeated not far from Chotzim by Lieutenant-General Count Soltikoff. The 29th, an action was fought between the Russian Kalmucks and the Kuban Tartars, to the disadvantage of the latter. June the 8th, the Turks were defeated at the mouth of the Dnieper, near Otchakoff. An action took place on the Dniester on the 19th, when the troops of Prince Proserofskoi forced the Turks to repass the river in great disorder. Chotzim was taken on the 19th of September. Yassy, in Moldavia, was taken on the 27th of September. Bukarescht, in Wallachia, was taken, and the hospodar made prisoner, in November 1770. A victory was gained

An. 1769. Progress and conclusion of the war with Turkey.

History. by the Russians under Generals Podhorilshany and Potemkin, near Fokshany. The town of Shursha was taken by Lieutenant-General Von Stoffeln, February 4. A Russian fleet appeared in the port of Maina, in the Morca, on the 17th February. Mistra, the Lacedæmon of the ancients, and several other towns of the Morea, were taken in February. Arcadim in Greece surrendered, and a multitude of Turks were made prisoners, in the same month. The Turks and Tartars were driven from their intrenchments near the Pruth, by Count Romantsof, Prince Repnin, and General Bauer, 11th-16th June. Prince Prosorofskoi gained several advantages near Otchakof, June 18. The Russian fleet, under Count Alexei Orlof, gained a complete victory over the Turks near Tschesme, 24th June; the consequence of this victory was the destruction of the whole Turkish fleet, near Tschesme, where it was burned by Admiral Greig on the 26th of June. A battle was fought on the Kagul, in which Count Romantsof defeated the Turkish army, consisting of a hundred and fifty thousand men, and took their camp, and all the artillery, July 21. The fortress Bender was taken July 22. The town of Ismail was taken by Prince Repnin, July 26; Kilia by Prince Repnin, August 21; and Akjerman in October. Brailof was taken on the 10th of November 1771; the town of Kaffa, June 29; and numberless other victories were obtained by sea and land, till peace was concluded on the 13th January 1775. By this the Crimea was declared independent of the Porte, and all the vast tract of country between the Bog and Dnieper was ceded to Russia, besides the Kuban and the isle of Taman, with free navigation in all the Turkish seas, including the passage of the Dardanelles, privileges granted to the most favoured nations, and stipulations in behalf of the inhabitants of Moldavia and Wallachia.

An. 1779. In 1779, the empress intending to divide the empire into viceroyalties, began in January with the viceroyalty of Orlof. March 21st, a new treaty was signed at Constantinople between Russia and the Porte. May 13th, the treaty of peace between the belligerent powers in Germany and the French king was signed under the mediation of her majesty. In October, a ship built at Taganrog, named the Prince Constantine, sailed to Smyrna with Russian commodities. December 3d, the viceroyalty of Voronetsk was instituted; and the 27th, Count Romantsof Zadunaiski opened the viceroyalty of Kursk with great solemnity.

An. 1780-1. In 1780, February 28th, appeared the memorable declaration of her imperial majesty, relating to the safety of navigation and commerce of the neutral powers. In 1781, March 1st, the empress became mediatrix between England and Holland; April 5th, instituted the first public school in St Petersburg.

An. 1782. In 1782, by a command of her majesty, dated January the 18th, a Roman Catholic archbishop was installed in the city of Mohilef, with authority over all the Catholic churches and convents in the Russian empire. August 7th, the famous equestrian statue of Peter the Great, being finished, was uncovered to the public in presence of the empress, on which occasion she published a proclamation containing pardons for several criminals. November 22d, the order of St Vladimir was instituted. The 27th, the empress published a new tariff.

An. 1783. In 1783, May 7th, the empress instituted a seminary for the education of young persons of quality at Kursk. June 21st, a treaty of commerce was concluded with the Ottoman Porte. July, the institution of the other viceroyalties of the empire followed in succession. On July 21st, the empress published a manifesto by her commander-in-chief Prince Potemkin, in the Krim, in regard to the taking possession of that peninsula, the Kuban, and the island of Taman. The 24th, a treaty was concluded with Heraclius II. czar of Kartalinia and Kachetti, by which he submitted himself, his heirs and successors for ever, with his territo-

ries and dominions, to the sceptre of her majesty, her heirs and successors. On the 29th, accounts were received from the camp of Prince Potemkin, at Karas-Basar, that the clergy, the beys, and other persons of distinction, with the towns of Karas-Basar, Bachtshiserai, Achmetchet, Kaffa, Kosloff, with the districts of Turkanskoikut and Neubasar, and that of Perekop, in the peninsula of the Krim, together with the hordes of Edissank and Dshambolusk, the sultan Alm Gray, and his vassals, with all the Budshaks and Bashkirs there, and all the tribes dwelling beyond the river Kuban, the sultan Boatur Giray and his vassals, took the oath of allegiance to her imperial majesty, and with willing hearts submitted for ever to her glorious sway. On the 30th the hospodar of Wallachia was deposed, and Draco Sutzo set up in his place. September 22d, her majesty raised Gabriel, archbishop of Novgorod and St Petersburg, to the dignity of metropolitan. October 21st, in the great hall of the Academy of Sciences, the new institution of the Imperial Russian Academy was opened, after a most solemn consecration by the metropolitan Gabriel, and others of the clergy, under the presidency of the Princess Dashkoff. November 7th, the empress became mediatrix for accommodating the differences between the king of Prussia and the city of Dantzic. The school for surgery was opened at St Petersburg on the 18th. December 13th, a school commission was instituted for superintending all the public schools. On the 28th, an act was concluded with the Ottoman Porte, by which the possession and sovereignty of the Krim, the Kuban, and Taman, were solemnly made over to the empress.

An. 1784. 1784. January 1st, the senate, in a speech by Field-Marshal Count Razomofskoi, performed the ceremony, repeated annually, of most humbly thanking her majesty for the benefactions which she had graciously bestowed on the whole empire in the preceding year. October 14th, the Lesgiers, having crossed the river Alasan, and invaded the dominions of Georgia, were repulsed with great loss by a detachment of Russian troops. December 29th, Katolikos Maksim, the serdar and court-marshal Prince Zeretelli, and the chief justice Kuinichese, ambassadors from David, czar of Imeretia, were admitted to a public audience of her majesty, at which they submitted, in the name of the czar, him and his subjects to the will and powerful protection of her imperial majesty, as the rightful head of all the sons of the orthodox eastern church, and sovereign ruler and defender of the Georgian nations.

An. 1785. 1785. The 12th of January, Maurocordato, hospodar of Wallachia, was deposed, and Alexander Maurocordato, his uncle, restored to that dignity. The 21st, the empress visited the principal national school, and passed a long time in examining the classes, and the proficiency of the youth in that seminary; on which occasion a marble tablet was fixed in the wall of the fourth class, with this inscription, in gold letters: THOU VISITEST THE VINEYARD WHICH THINE OWN HAND HATH PLANTED. April 21st, the privileges of the nobility were confirmed, and on the same day the burghers of towns constituted into bodies corporate, by a particular manifesto. The public school in Voronetsk was opened. July 14th, a manifesto was issued, granting full liberty of religion and commerce to all foreigners settling in the regions of Mount Caucasus, under the Russian government. September 15th, the public school at Nishnei Novgorod was opened. October 12th, the Jesuits in White Russia, in a general assembly, elected a vicar-general of their order. November 1st, a treaty of commerce was concluded with the emperor of Germany. The 24th, the Russian consul in Alexandria made his public entry on horseback, an honour never before granted to any power; erected the imperial standard on his house, with discharge of cannon, &c. December 28th, a Russian mercantile frigate, fully freighted, arrived at Leghorn from Constantinople.

History

History.

1786. The 29th of January, the empress confirmed the plan of a navigation school. February 12th, by a decree, the usual slavish subscriptions to petitions were to be discontinued; and, instead of them, only the words *humble* or *faithful subject*, and in certain cases only *subject*, were ordained to be used. March 2d, the empress granted the university of Moscow a hundred and twenty-five thousand roubles, and all the materials of the palace Kremlin, for increasing its buildings. The 25th, a decree was passed for making and repairing the roads throughout the whole empire at the sole expense of the crown, and four millions of roubles were immediately allotted for the road between St Petersburg and Moscow. April 10th, a new war establishment for the army was signed; 23d, the hospodar of Wallachia was deposed, and Mavroyeni set up in his place. June 28th, the empress instituted a loan bank at St Petersburg, to the fund whereof she allotted twenty-two millions to be advanced to the nobility, and eleven millions to the burghers of the town, on very advantageous terms. August 5th, there were published rules to be observed in the public schools. October 4th, a large Russian ship, with Russian productions, from St Petersburg, arrived at Cadiz. November 24th, the empress erected public schools at Tarnobov. December 14th, Prince Ypsilanti was appointed hospodar of Moldavia, in the room of the deposed Maurocordato. December 31st, a treaty of commerce and navigation was concluded between Russia and France.

An. 1787.
Renewal of
hostilities
with Tur-
key.

1787. March, public schools were endowed and opened at Rostof, Uglitsk, Molaga, and Romanof, in the viceroyalty of Yaroslavl; also at Ustiug and Arasovitz, in the viceroyalty of Vologda. April 21st, a manifesto was issued for promoting peace and concord among the burghers of the empire. The 25th, took place the concerted interview between the empress and the king of Poland, near the Polish town of Konief. The treaty of commerce with England being expired, the British factory were informed that they must henceforward pay the duties on imports in silver money, like the other nations who had no commercial treaty. May 7th, the empress hearing that the emperor of Germany was at Cherson, proceeded thither, and met him there on the 12th. June 28th, the twenty-fifth anniversary of her reign, she displayed various marks of her bounty. The debtors to the crown were forgiven, prisoners released, imposts taken off, soldiers rewarded, &c. The 12th July, the new-built school at Riga, called a *Lyceum*, was solemnly dedicated. August 5th, Bulgakoff, the Russian ambassador at the Ottoman Porte, was imprisoned in the Seven Towers, contrary to the law of nations, which the empress regarded as a public declaration of war. 21st, The Turkish fleet at Otchakof attacked the Russian frigate Skorui and the sloop Bitingi, but was repulsed and put to flight by the bravery of the latter. Many signal advantages were gained over the Turks; several public schools founded in various parts of the empire between this and August following, during which time the war broke out with Sweden.

An. 1788.
War with
Sweden.

1788. August 12th, in the expedition beyond the Kuban, the Russian troops entirely routed a company of four thousand Arutayans and Alcasinians; eight hundred of the enemy were slain, and five villages destroyed. 15th, The surrender of the Turkish fortress of Dubitscha took place. 18th, The Turks made a violent sortie from Otchakof, but were repulsed by the Russian yagers, and, after a battle of four hours, were driven back with the loss of five hundred men. 23d, A fierce battle was fought between the Russian troops and Sacubanians, in which the latter lost a thousand men. The Russian fleet kept the Swedish blocked up in Sveaborg ever since the battle of July 6th. The Swedish army left the Russian territory in Finland. September 18th, The town and fortress of Chotzim surrendered to the Russians, with the garrison of two thousand men, a hundred and fifty-three cannon fourteen mortars, and much ammunition.

19th–29th, A small Russian squadron from the fleet at Sevastopol, cruising along the coast of Anatolia, destroyed many of the enemy's vessels, prevented the transporting of the Turkish troops, and returned with great booty. 20th, Us-senier Shamanachin, chief of the Bsheduchovians, was, on his petition, admitted a subject of Russia. 26th, A numerous host of Kubanians and Turks were beaten on the river Ubin, with the loss of fifteen hundred men. November 7th, Prince Potemkin, at the head of his Kozaks, took the island Beresan, with many prisoners and much ammunition. December 6th, the town and fortress of Otchakof were taken by Prince Potemkin Tavrisheskoi; nine thousand five hundred and ten of the enemy were killed, four thousand taken prisoners, a hundred and eighty standards, three hundred and ten cannons and mortars. All the inhabitants were taken prisoners, amounting to twenty-five thousand; the Russians lost nine hundred and fifty-six killed and eighteen hundred and twenty-four wounded. December 19th, General Kamenskoy gained considerable advantages over the Turks near Gangur.

1789. April 16th, Colonel Rimskoy Korsakoff was surrounded by the Turks, who were beaten, with great slaughter, by Lieutenant-General Von Derfelden. 17th–28th, Some Russian cruises from Sevastopol effected a landing on Cape Karakarman, burnt six mosques, and carried off great booty. 20th, General Derfelden drove the Turks from Galatch, gained a complete victory, killed two thousand, took fifteen hundred prisoners, with the seraskier Ibrahim Pasha, and the whole camp. Several skirmishes took place between the Russians and Swedes in Finland, always to the advantage of the former. May 31st, another victory was gained over the Swedes. June 5th, Sulkof was taken from the Swedes, and Fort St Michael on the 8th. July 15th, Admiral Tchitchagoff engaged the Swedish fleet under the command of the Duke of Sudermania; but no ship was lost on either side. 21st, A battle was fought at Fokshany, to the great loss of the Turks, and Fokshany was taken. August 13th, the Russian galley fleet fought the Swedish under Count Ehrenschwerdt, the former took a frigate and five other ships, and two thousand prisoners. August 21st, another sea-fight took place, and Prince Nassau Siegen made good his landing of the Russian troops in sight of the king of Sweden at the head of his army. September 7th, Prince Repnin attacked the seraskier Hassan Pasha near the river Selt-ska, and took his whole camp. 11th, Count Suwaroff and prince of Saxe-Cobourg engaged near the river Kymnik the grand Turkish army of nearly a hundred thousand men, and gained a complete victory; from which Count Suwaroff received the surname Kymnikskoi. 14th, The Russian troops under General Ribas took the Turkish citadel Chod-shabey, in the sight of the whole of the enemy's fleet. 30th, The fortress Palanka being taken, the town of Belgorod or Akjerman surrendered to Prince Potemkin Tavrisheskoi. November 4th, the town and castle of Bender submitted at discretion to the same commander.

1790. April 24, General Numsen gained a victory over the Swedes near Memel. May 2, a sea-fight took place off Revel, in which the Russians captured the Prince Charles of sixty-four guns from the Swedes; and in this engagement those two gallant English officers Captains Trevenian and Dennison were killed. 23d, The fleet under Vice-Admiral Kruse engaged the Swedish fleet near the island Siskar in the Gulf of Finland, without any advantage being gained on either side, though they fought the whole day. 24th, An action was fought at Savataipala, when the Swedes were forced to fly. June 6th, the Swedes were defeated by Major Buxhovden, on the island Uransari. June 22, the whole Swedish fleet, commanded by the Duke of Sudermania, was entirely defeated by Admiral Tchitchagoff and the Prince of Nassau Siegen; on this occasion five thousand prisoners were taken, amongst whom were the centre admiral and two hundred officers. 28th, General Denisoff defeated

History. the Swedes near Davidoff. July 9th, Admiral Ushakoff obtained a victory over the Turkish fleet commanded by the capudan pasha, at the mouth of the Straits of Yenikali. August 3d, peace was concluded with Sweden, without the mediation of any other power. August 28th, 29th, an engagement took place on the Euxine, not far from Chodshabey, between the Russian admiral Ushakoff and the capudan pasha, when the principal Turkish ship, of eighty guns, was burnt, one of seventy guns and three others taken, the admiral Said Bey being made prisoner, and another ship sunk; the rest made off. September 30th, a great victory was obtained over the Turks by General Germann, with much slaughter, and the seraskier Batal Bey, and the whole camp, were taken. October 18th, Kilia surrendered to Major Ribas. November 6th, 7th, the fortress Kultsha and the Turkish flotilla were taken. December 11th, the important fortress of Ismail, after a storming for seven hours without intermission, surrendered to Count Suwaroff, with the garrison of forty-two thousand men; thirty thousand eight hundred and sixteen were slain on the spot, two thousand died of their wounds, nine thousand were taken prisoners, with two hundred and sixty-five pieces of cannon, an incredible store of ammunition, &c. The Russians lost only eighteen hundred and fifteen killed, and two thousand four hundred and fifty wounded.

An. 1791. 1791. March 25th–31st, the campaign opened by the troops under Prince Potemkin, not far from Brailoff, when the Turks were defeated in several battles, in which they lost upwards of four thousand men. June 5th, the troops under General Golenitshef Kutusoff, near Tultsha, drove the Turks beyond the Danube, and at Babada entirely routed a body of fifteen thousand men, of whom fifteen hundred were left dead upon the field. 22d, The fortress Anapuas was taken by storm, when the whole garrison, consisting of twenty-five thousand men, were put to the sword, excepting one thousand who were taken prisoners. 28th, The troops under Prince Repnin attacked the Turkish army, consisting of nearly eighty thousand men, commanded by the grand vizir Yussuf Pasha, eight pashas, two Tartar sultans, and two beys of Anatolia; and after a bloody battle of six hours, entirely routed them: five thousand Turks were killed in their flight. June 28th, Sudskuk Kale was taken. July 31st, Admiral Ushakoff beat the Turkish fleet on the coasts of Rumelia. Prince Repnin and Yussuf Pasha signed the preliminaries of peace between the Russian empire and the Ottoman Porte, by which the Dniester was made the boundary of the two empires, with the cession of the countries lying between the Bog and Dniester to Russia. August 15th, 16th, at Pilnitz, near Dresden, a congress was held by the emperor of Germany, the king of Prussia, the elector of Saxony, the Count d'Artois, &c. &c. One of the most important events in this year was the death of Prince Potemkin, at Yassy in Moldavia, on the 15th October.

An. 1792. 1792. Early in this year Bulgakoff, the Russian minister at Warsaw, declared war against Poland; and the Polish patriots raised an army in which Thaddeus Kosciuszko soon bore a conspicuous part.

In 1788, the diet of Poland had abrogated the constitution which the empress of Russia had, in 1775, compelled that nation to adopt, and had formed an alliance with the king of Prussia, by way of defence against the further encroachments of the Russian despot. Three years after, viz. on the 3d of May 1791, the new constitution, which was intended further to destroy the ambitious hopes of Catherine, was decreed at Warsaw. (See POLAND.) These were affronts which the Russian empress could not forgive, and in one of the *conciliabula*, in which the ministers of state, and the favourite for the time being, sat to regulate the affairs of the north of Europe, and to determine the fate of the surrounding nations, the annihilation of the Polish monarchy was resolved on.

The declaration of war above mentioned was denounced by Bulgakoff at an assembly of the diet. That body received the declaration with a majestic calmness, and resolved to take measures for the defence of the nation. The generous enthusiasm of liberty soon spread throughout the state, and even the king pretended to share in the general indignation. An army was hastily collected, and the command of it bestowed on Prince Joseph Poniatowsky, a general whose inexperience and frivolous pursuits were but ill adapted to so important a charge.

In the mean time several Russian armies were preparing to overwhelm the small and disunited forces of the Poles. A body of eighty thousand Russians extended itself along the Bog, another of ten thousand was collected in the environs of Kief, and a third of thirty thousand penetrated into Lithuania. While these armies were carrying murder and desolation throughout the Polish territories, Catherine was employing all her arts to induce the neighbouring powers to join in the partition of Poland; and in this she was but too successful. A treaty was accordingly concluded between the empress and the king of Prussia, by which each appropriated to itself a share of the remains of Poland. Stanislas Augustus, the powerless head of that state, was prevailed on to make a public declaration that there was a necessity for yielding to the superiority of the Russian arms.

An. 1793. 1793. On the 9th of April the Polish confederation of the partisans of Russia assembled at Grodno; and on this occasion the Russian general placed himself under the canopy of that throne which he was about to declare for ever vacant, and the Russian minister Sievers produced a manifesto, declaring the intention of his mistress to incorporate with her domains all the Polish territory which her arms had conquered.

The Russian soldiers dispersed throughout the provinces committed depredations and ravages of which history furnishes but few examples. Warsaw became especially the theatre of their excesses. Their general, Igelstrom, who governed in that city, connived at the disorders of the soldiers, and made the wretched inhabitants feel the whole weight of his arrogance and barbarity. The patriots of Poland had been obliged to disperse, their property was confiscated, and their families reduced to servitude. Goaded by so many calamities, they once more took the resolution to free their country from the oppression of the Russians, or perish in the attempt. Some of them assembled, and sent an invitation to Kosciuszko, to come and lead them on against the invaders of their freedom.

Kosciuszko had retired to Leipzig, with a few other Poles, all eminent for patriotism and military ardour. These hesitated not a moment in giving their approbation to the resolution adopted by their indignant countrymen; but they were sensible that, in order to succeed, they must begin by emancipating the peasants from the state of servitude under which they then groaned. Kosciuszko and Zagonchek repaired with all expedition to the frontiers of Poland, and the latter proceeded to Warsaw, where he held conferences with the chief of the conspirators, and particularly with several officers, who declared their detestation of the Russian yoke. All appeared ripe for a general insurrection; and the Russian commanders, whose suspicions had been excited by the appearance of Kosciuszko on the frontiers, obliged that leader and his confederates to postpone for a time the execution of their plan. In order to deceive the Russians, Kosciuszko retired into Italy, and Zagonchek repaired to Dresden, whither Ignatius Potoski and Kolontay had gone before him. On a sudden, however, Zagonchek appeared again at Warsaw, but was impeached by the king to General Igelstrom, and, in a conference with the general, was ordered to quit the Polish territory. He must now have abandoned his enterprise altogether, or immediately proceeded to open insurrection. He chose the latter.

Attempts of
the patriots
to oppose
the en-
croach-
ments of
Russia.

1794. Kosciuszko was recalled from Italy, and arrived at Cracow, where the Poles received him as their deliverer. Here he was joined by some other officers, and took the command of his little army, consisting of about three thousand infantry and twelve hundred cavalry. On the 24th of March was published the manifesto of the patriots, in which they declared the motives for their insurrection, and called on their countrymen to unite in the glorious attempt to free the republic from a foreign yoke. Kosciuszko was soon joined by three hundred peasants armed with scythes, and some other small reinforcements gradually came in. A body of seven thousand Russians had collected to oppose the movements of this little army, and a battle took place, in which the patriots were successful.

While the insurrection had thus auspiciously commenced on the frontiers, the confederates of the capital were nearly crushed by the exertions of the Russian general. Hearing at Warsaw of the success of Kosciuszko, Igelsstrom caused all those whom he suspected of having any concern in the insurrection to be arrested; but these measures served only to irritate the conspirators. On the 18th of April they openly avowed their confederacy with the patriots of the frontiers, and proceeded in great numbers to attack the Russian garrison. Two thousand Russians were put to the sword, and the general, being besieged in his house, proposed a capitulation; but, profiting by the delay that had been granted him, he escaped to the Prussian camp, which lay at a little distance from Warsaw.

Wilna, the capital of Lithuania, followed the example of Warsaw; but the triumph of the insurgents was there less terrible, as Colonel Yasinsky, who headed the patriots, conducted himself with so much skill, that he made all the Russians prisoners without bloodshed. The inhabitants of the cantons of Chelm and Lublin also declared themselves in a state of insurrection, and three Polish regiments who were employed in the service of Russia espoused the cause of their country. Some of the principal partisans of Russia were arrested, and sentenced to be hanged.

Kosciuszko exerted himself to the utmost to augment his army. He procured recruits among the peasants, and to inspire them with the more emulation, he adopted their dress, ate with them, and distributed rewards among such as appeared most to merit encouragement. All his attempts to inspire the lower orders of the Poles with the ardour of patriotism were, however, unavailing. A mutual distrust prevailed between the nobles and the peasants, and this was fomented by the arts of Stanislas and the other partisans of Russia.

The empress had sent into Poland two of her best generals, Suwaroff and Fersen. For some time Kosciuszko succeeded in preventing the junction of these commanders, and several engagements took place between the Russians and patriots, in which the former were generally successful. At length, on the 4th of October, the fate of Poland was decided by a sanguinary conflict between Kosciuszko and Fersen, at Macieyovitch, a small town of Little Poland, about sixty miles from Warsaw. The talents, valour, and desperation of Kosciuszko could not prevent the Poles from yielding to superior numbers. Almost the whole of his army was either cut in pieces or compelled to surrender at discretion, and the hero himself, covered with wounds, fell senseless on the field of battle, and was made prisoner.

The small number that escaped fled to Warsaw, and shut themselves up in the suburb of Praga. Hither they were pursued by Suwaroff, who immediately laid siege to the suburb, and prepared to carry it by storm. On the 2d of November he gave the assault, and having made himself master of the place, put to the sword both the soldiers and the peaceable inhabitants, without distinction of age or sex. It is computed that twenty thousand persons fell victims to the savage ferocity of the Russian general; and, covered

with the blood of the slaughtered inhabitants, the barbarian entered Warsaw in triumph.

Thus terminated the feeble resistance of the Polish patriots. The partition of the remaining provinces was soon effected, and Stanislas Augustus, who had long enjoyed merely the appearance of royalty, and had degraded himself by becoming the instrument of Russian usurpation, retired to Grodno, there to pass the remainder of his days, on a pension granted him by the empress.

1795. On the 18th of February, a treaty of defensive alliance between the empress of Russia and his Britannic majesty was signed at St Petersburg. The ostensible object of this treaty was to maintain the general tranquillity of Europe, and more especially of the north; and by it Russia agreed to furnish Great Britain with ten thousand infantry and two thousand horse in case of invasion; while Great Britain was, under similar circumstances, to send her imperial majesty a squadron consisting of two ships of seventy-four guns, six of sixty, and four of fifty, with a complement of four thousand five hundred and sixty men. On the 18th of March was signed the act by which the duchy of Courland, together with the circle of Pilten, all of which had lately belonged to the Duke of Courland, but had long retained only the shadow of independence, submitted themselves to the Russian dominion.

In this year there took place between the courts of St Petersburg and Stockholm a dispute which threatened to terminate in a war. Gustavus III. had been assassinated by Ankerstroem at a masquerade, on the 15th of March 1791; and the young king Gustavus Adolphus being still a minor, the Duke of Sudermania, his uncle, had been appointed regent of the kingdom. The regent had determined to effect a marriage between his nephew and a princess of the house of Mecklenburg; but Catherine publicly declared that the late king had betrothed his son to one of her grand-daughters. The misunderstanding hence originating was increased by the rude and indecorous behaviour of the Baron von Budberg, the Russian minister at Stockholm; and matters seemed tending to an open rupture, when, in the year 1796, a French emigrant named Christin effected a reconciliation, and General Budberg, the baron's uncle, was sent as ambassador to Stockholm from the Russian court. In consequence of this reconciliation, the young king, attended by the regent, and a numerous train of Swedish courtiers, set out on a visit to St Petersburg, where they arrived on the 24th of August, and an interview took place between the empress and her royal visitors, for the purpose of finally adjusting the projected matrimonial alliance. Gustavus Adolphus was much pleased with the appearance of the Grand Duchess Alexandra, but informed the empress, that by the fundamental laws of Sweden he could not sign the marriage-contract before the princess had abjured the Greek religion; and as neither the solicitations nor the flatteries of Catherine could prevail on the young monarch to depart from the received custom of his country, the negotiation ended, and the next day Gustavus and his retinue quitted St Petersburg.

The last transaction of importance in the reign of Catherine was her invasion of the Persian territories, undertaken for the purpose of acquiring certain possessions on the shores of the Caspian. A Russian army entered Daghestan, and made itself master of Derbent, but was afterwards defeated by the Persians under Aga Mahmoud. The death of the empress took place, as we have elsewhere stated, on the 9th of November of this year; and the Grand Duke Paul Petrovitch ascended the throne under the title of Paul I.

Paul Petrovitch had attained his forty-second year before the death of his mother placed him on the imperial throne; but for many years before her death he had lived in a state of comparative obscurity and retirement, and had apparently been considered by the empress as incapable of taking

Dispute
between
Sweden
and
Russia.

History. any active part in the administration of affairs. It is well known that Catherine never admitted him to any participation of power, and kept him in a state of the most abject and mortifying separation from court, and in almost total ignorance of the affairs of the empire. Although by his birth he was generalissimo of the armies, president of the admiralty, and grand admiral of the Baltic, he was never permitted to head even a regiment, and was interdicted from visiting the fleet at Cronstadt. From these circumstances, it is evident that the empress either had conceived some jealousy of her son, or saw in him some mental imbecility, which appeared to her to disqualify him for the arduous concerns of government. There is little doubt, from the circumstances which distinguished his short reign, that Catherine had been chiefly influenced in her treatment of the grand duke by the latter consideration. There were certainly times at which Paul displayed evident marks of insanity, though he occasionally gave proofs of a generous and tender disposition, and even of intellectual vigour.

It is generally believed that, a short time before her death, Catherine committed to Plato Zuboff, her last favourite, a declaration of her will, addressed to the senate, desiring that Paul should be passed over in the succession, and that on her death the Grand Duke Alexander should ascend the vacant throne. As soon as Zuboff was made acquainted with the sudden death of the empress, he flew to Pavlovsk, about twenty-three miles from St Petersburg, where Paul occasionally resided; but meeting the grand duke on the road, he, after a short explanation, delivered up the important document. Paul, charmed with his zeal and loyalty, rewarded the favourite, by permitting him to retain the wealth and honours which had been heaped on him by his mistress, while a general and rapid dispersion soon took place among the other adherents of the late sovereign. On the day following the death of his mother, Paul made his public entry into St Petersburg, amidst the acclamations of all ranks of people.

Singular funeral of Peter III.

One of the first measures adopted by the new emperor excited considerable surprise, and divided the opinions of the public with respect to the motives by which it had been suggested; some attributing it to his respect for the memory of his late father, and others to a culpable reflection on that of his mother. He ordered the corpse of Peter III. to be removed from the sepulchre in which it had been deposited in the church of St Alexander Nefsky, solemnly crowned it, and caused it to lie in state for three weeks, while it was watched day and night by the only two remaining conspirators who had assisted at his assassination. After this dreadful mark of his justice on the murderers of his father, surely more terrible to the guilty mind than death itself, he consigned the ashes to the sepulchre of Catherine II. in the cathedral of St Peter and St Paul, obliging the assassins to walk in the procession as chief mourners.

Few political events of any importance marked the reign of Paul previously to the year 1798, when, in consequence of a treaty between him and the emperor of Germany, a Russian army of forty-five thousand men, under Field-Marshal Suwaroff, joined the imperialists in the Austrian territories in Italy. The progress of Suwaroff, his successes over Moreau, and his final recall by his master, have already been related in the article FRANCE.

An. 1799. Treaty of alliance between Russia and Britain. In 1799, Paul entered into a treaty of offensive and defensive alliance with his Britannic majesty. This treaty was signed at St Petersburg on the 22d of June, having

History. been preceded by a provisional treaty between the same powers at the end of the year 1798. By the latter, which was fortified by a relative treaty with Austria, it had been stipulated that Paul should assist the king of Prussia, if the latter could be persuaded to join his arms to the allied powers against France, with forty-five thousand men, and that the king of Great Britain should pay to Russia a subsidy of L.75,000 sterling per month; and in case the king of Prussia should refuse to join the coalition, the same number of troops, in consideration of the same subsidy, should be employed, as occasion might require, to assist the common cause. By the new treaty, the emperor of Russia, instead of the forty-five thousand troops, engaged to furnish seventeen thousand five hundred and ninety-three, with the necessary artillery, to be employed in an expedition against Holland; and six ships, five frigates, and two transports, for the purpose of transporting part of the invading army from Britain to the continent. In consideration of these succours, the court of London engaged to advance to Russia a subsidy of L.41,000 sterling per month; to pay the sum of L.58,929. 10s. sterling for the expenses of equipping the fleet; and after the period of three months had elapsed from such equipment, to pay a further subsidy of L.19,642. 10s. sterling per month, as long as the fleet should remain under the command of his Britannic majesty.

In consequence of this treaty, a Russian fleet joined that of Britain in Yarmouth Roads, and took part in the unfortunate expedition to the coast of Holland, which was undertaken in the summer of 1799. The military fame of Russia was more augmented by the share which its army under Suwaroff took in the campaign of Italy during the same year, although the victories which won for the veteran his name of Italmiski were far more than overbalanced by the misfortunes which ensued in Switzerland under the emperor's favourite Korsakoff. But in December 1800, Paul, after having laid an embargo on the British shipping which lay in his ports, openly abandoned his relations with our country, and proclaimed, in confederacy with Sweden and Denmark, to whom Prussia afterwards added herself, the great Northern Coalition with France against Great Britain.

In the beginning of the year 1801, all Europe was astonished or amused by a paragraph which appeared in the Hamburg Gazette of the 16th of January. It was dated from Petersburg, the 30th December 1800, and is as follows. An. 1801. Paul's challenge to the sovereigns of Europe.

"We learn from Petersburg, that the emperor of Russia, finding that the powers of Europe cannot agree among themselves, and being desirous to put an end to a war which has desolated it for eleven years past, intends to point out a spot to which he will invite all the other sovereigns, to repair and fight in single combat; bringing with them, as seconds and squires, their most enlightened ministers and their most able generals, such as Messrs Thugot, Pitt, and Bernstorff; and that the emperor himself proposes being attended by Generals Count de Pahlen and Khutosof. We know not if this report be worthy of credit; however, the thing appears not destitute of some foundation, and bears strong marks of what he has been often taxed with."

This paragraph was immediately copied or translated into all the public papers, and it was strongly affirmed by many that it was the composition of Paul himself. This has since been confirmed by the poet Kotzebue, who was employed by the emperor of Russia to translate the original into German, for the express purpose of its being inserted in the Hamburg Gazette.¹

¹ This paragraph is such a curious *morceau* of witty insanity, that we shall here give the original French, as written by Paul himself, and published by Kotzebue in his account of his exile into Siberia. "On apprend de Petersbourg, que l'Empereur de Russie, voyant que les puissances de l'Europe ne pouvoient s'accorder entr'elles, et voulant mettre fin a une guerre qui la desoloit depuis onze ans, vouloit proposer un lieu où il inviteroit tous les autres Souverains, de se rendre et y combattre en champ clos, ayant avec eux pour écuyers juges de camp et heros des armes leurs ministres les plus éclairés et les généraux les plus habiles, tels que MM. Thugot, Pitt, Bernstorff; lui-même se proposant de prendre avec lui les généraux C. de Pahlen et Khutosof. On ne sait si on doit y ajouter foi; toutefois, la chose ne paroît pas destituée de fondement, en portant l'empreinte de ce dont il a souvent été taxé."

History.

Other marks of the emperor's derangement.

This was not the only mark of mental derangement displayed by the unhappy monarch. The army, which formed his favourite employment, was tormented by incessant caprices affecting its discipline; and the press, the native Russians, and the resident foreigners, suffered tyrannical and unaccountable restrictions. His favours and his displeasure were alternately experienced by some of his most distinguished courtiers and adherents. Stanislas, the deposed king of Poland, partook by turns of his beneficence and his severity; and at length, on the death of that monarch, Paul assisted at his funeral, commanded in person the guards that attended on the ceremony, and uncovering himself with the utmost emotion, saluted the coffin as it passed. To the memory of the aged Suwaroff, who is said to have fallen a broken-hearted victim to the distraction of his imperial master, he raised a colossal statue of bronze; and on the days when he reviewed his troops in the square where the figure had been erected, he used to command them to march by in open order, and face the monument. Notwithstanding the important service that had been rendered him by Zuboff, the emperor soon became disgusted with him; spoke of him to his friends with great asperity; at length denounced him as a defaulter to the imperial treasury of half a million of roubles; and, convinced of the justice of the allegation, proceeded to sequester the vast estates which belonged to him and his two brothers. Driven to desperation by such conduct, the second brother of the favourite one day walked up boldly to the emperor upon the parade, and with manly eloquence represented the injustice of his measures. Paul received him without anger, heard him without interruption, and restored the property; but soon afterwards he ordered Plato Zuboff to reside on his estate, though he again restored him to favour.

Conspiracy formed against the emperor.

It is not surprising that these instances of folly and caprice should alarm and disgust many of the nobles. In particular, Count Pahlen, the governor of St Petersburg, with some other men of rank, entered into a confederacy with Zuboff and his brothers for removing the emperor. In their conferences, which were managed with great prudence and discretion, it was resolved that Paul should die, and that the day of the festival called Maslaintza, the 11th of March O. S. 1801, should be the day for executing the awful deed. At the time of this plot, the emperor and his family resided in the new palace of St Michael, an enormous quadrangular pile standing at the bottom of the summer gardens. Paul being anxious to inhabit this palace soon after he was crowned, the masons, carpenters, and various artificers, toiled with incredible labour, by day and by torch-light, under the sultry sun of the summer, and in all the severity of a polar winter; and in three years this enormous and magnificent fabric was completed. The whole is moated round; and when the stranger surveys its bastions of granite, and numerous draw-bridges, he is naturally led to conclude that it was intended for the last asylum of a prince at war with his subjects. Those who have seen its massive walls, and the capaciousness and variety of its chambers, will easily admit that an act of violence might be committed in one room, and not be heard by those who occupy the adjoining one; and that a massacre might be perpetrated at one end, and not known at the other. Paul took possession of this palace as a place of strength, and beheld it with rapture, because his imperial mother had never even seen it. While his family were here, by every act of tenderness endeavouring to soothe the terrible perturbation of his mind, there were not wanting those who exerted every stratagem to inflame and increase it. These people were constantly insinuating that every hand was armed against him. With this impression, which added fuel to his burning brain, he ordered a secret staircase to be constructed, which, leading from his own

chamber, passed under a false stove in the anti-room, and led by a small door to the terrace.

History.

His assassination.

It was the custom of the emperor to sleep in an apartment next to the empress's, upon a sofa, in his regimentals and boots, whilst the grand duke and duchess, and the rest of the imperial family, were lodged at various distances, in apartments below the story which he occupied. On the 10th March, the day preceding the fatal night, whether Paul's apprehension, or anonymous information, suggested the idea, is not known; but conceiving that a storm was ready to burst upon him, he sent for Count Pahlen: "I am informed," said the emperor, "that there is a conspiracy on foot against me; do you think it necessary to take any precaution?" The count, without betraying the least emotion, replied, "Sire, do not suffer such apprehensions to haunt your mind; if there were any combinations forming against your majesty's person, I am sure I should be acquainted with it." "Then I am satisfied," said the emperor; and the governor withdrew. Before Paul retired to rest, he, beyond his usual custom, expressed the most tender solicitude for the empress and his children, kissed them with all the warmth of farewell fondness, and remained with them for a considerable time. He afterwards visited the sentinels at their different posts, and then retired to his chamber. Soon after the emperor had retired, the guard that was always placed at his chamber door was, on some pretext, changed by the officers who had the command for the night, and who were engaged in the conspiracy. One man only remained. This was a hussar whom the emperor had honoured with particular marks of attention, and who always slept at night in the antechamber, at his sovereign's bed-room door. This faithful soldier it was found impossible to remove, except by force, which at that time the conspirators did not think proper to employ. Silence now reigned throughout the palace, disturbed only by the pacing of the sentinels, or by the distant murmurs of the Neva; and only a few straggling lights were to be seen, irregularly gleaming through the windows of the palace. In the dead of the night, Zuboff and his friends, amounting to eight or nine persons, passed the draw-bridge, ascended the staircase that led to the emperor's apartments, and met with no opposition till they reached the antechamber, where the faithful hussar, awakened by the noise, challenged them, and presented his fusée. Though they must have admired the brave fidelity of the guard, neither time nor circumstances would admit of an act of generosity which might have endangered their whole plan of operations. Zuboff therefore drew his sabre, and cut the poor fellow down. In the mean time, Paul, roused by the unusual bustle, sprang from his couch. At this moment the whole party rushed into his chamber. The unhappy sovereign, anticipating their design, at first endeavoured to intrench himself behind the chairs and tables; but soon recovering some share of his natural courage, he assumed a high tone, told them they were his prisoners, and required them to surrender. Finding that they fixed their eyes steadily and fiercely upon him, and continued to advance, he implored them to spare his life, declared his willingness instantly to relinquish the sceptre, and to accept of any terms which they might dictate. He even offered to make them princes, and to confer on them orders and estates. Regardless alike of his threats and promises, they now began to press on him, when he made a convulsive effort to reach the window, but failed in the attempt; and, indeed, had he succeeded in his endeavour to escape that way, the height from the window to the ground was so great, that the expedient would probably have only put a more speedy period to his existence. As the conspirators drew him back, he grasped a chair, with which he knocked down one of the assailants, and a desperate conflict now took place. So great was the noise, that notwithstanding the massive walls and double folding

History. doors that divided Paul's apartments from those of the empress, she was disturbed, and began to call for help, when a voice whispered in her ear, commanding her to remain quiet, and threatening that if she uttered another word she should instantly be put to death.

Paul was now making his last struggle, when one of the party struck him on the temple with his fist, and laid him prostrate on the floor. Recovering from the blow, the unhappy monarch again implored his life. At this moment the heart of one of the conspirators relented, and he was observed to hesitate and tremble, when a young Hanoverian who was present exclaimed, we have passed the Rubicon; if we spare his life, we shall, before the setting of to-morrow's sun, become his victims; on saying which he took off his sash, turned it twice round the naked neck of the emperor, and giving one end to Zuboff, he himself drew the other, till the object of their attack expired.

Accession of Alexander Paulovitch. The Emperor Alexander, Paul's eldest son, was in his twenty-fourth year when he ascended the throne, and from his amiable disposition had acquired the love and respect of all his subjects. The first measure which he adopted, his proclamation, and his first imperial orders, all tended to encourage and confirm the confidence with which the people beheld him ascend the throne of his forefathers. He solemnly promised to tread in the steps of Catherine II.; he allowed every one to dress according to his own fancy; he exonerated the inhabitants of the capital from the trouble and duty of alighting from their carriages on the approach of the imperial family; he dismissed the court advocate, who was universally and justly detested; he suppressed the secret inquisition, that had become the scourge of the country; he restored to the senate its former authority, set at liberty the state prisoners, and recalled from Siberia several of the exiles. He even extended his mercy to the assassins of the late emperor. Zuboff was ordered not to approach the imperial residence, and the governor of the city was transferred to Riga.

It is not easy to explain the motives that induced Alexander to forego that vengeance which justice seemed to demand on the heads of his father's assassins. It has been attributed by one of his panegyrists to a forlorn and melancholy conviction that the murderers had been prompted to commit the bloody deed solely by a regard for the salvation of the empire. This conviction might have induced the young monarch to diminish the weight of the punishment which piety and justice called on him to inflict, but can scarcely account for his total forbearance.

Amicable disposition of Alexander towards Britain. Alexander, on his accession to the throne, appeared desirous to cultivate the friendship of the neighbouring states, and especially that of Great Britain. His late father, among other projects, had procured himself to be elected grand-master of the knights of Malta, and had laid claim to the sovereignty of that island. This claim, which had nearly produced a rupture between the courts of London and St Petersburg, Alexander consented to abandon, though he expressed a wish to be elected grand-master of the order, by the free suffrages of the knights. A confederacy, as we have seen, had been formed among the northern powers of Europe, with a view to oppose the British claim to the sovereignty of the seas; but by the spirited interference of the British court, especially with the cabinet of St Petersburg, the good understanding between Britain and the northern states was re-established, and the embargo which had been laid on British vessels in the Russian ports was taken off. Alexander, however, earnestly desired to maintain peaceful relations with France; and expressed this wish, both in public manifestos, and in private communications addressed to the First Consul.

Treaty of amity and commerce with Sweden. Early in the same year there was signed at St Petersburg a treaty of amity, commerce, and navigation, between Russia and Sweden, to continue for twelve years, by which Sweden was allowed to import into Russia, alum,

salt herrings, and salt, on the payment of one half of the duties then exacted, and into Russian Finland the produce of Swedish Finland duty free; while the importation of Russia into Sweden, of hemp, linen, and tallow, was allowed at one half of the existing duties, and of linseed at two thirds. The most remarkable part of this treaty was the recognition, by the court of St Petersburg, of the northern confederacy, which the amicable adjustment with Britain appeared to have done away. The commerce of Russia had now recovered its former splendour. The exports from the city of Riga alone, for the year ending July 1801, amounted to L.1,043,806, and of these exports England alone imported to the value of L.386,935.

History. On the 25th of March 1802 was signed at Amiens the definitive treaty of peace between the belligerent powers of Europe, by one material article of which the islands of Malta, Gozo, and Comino, were to be restored to the knights of St John of Jerusalem, under the protection and guarantee of France, Great Britain, Austria, Spain, Russia, and Prussia; and his Sicilian majesty was invited to furnish two thousand men, natives of his states, to serve in garrisons at the different fortresses of the said islands, for one year after their restitution to the knights, or until they should be replaced by a force deemed sufficient by the guaranteeing powers. Some time after the conclusion of this treaty, disputes arose among the contracting powers relative to the sovereignty of Malta, which the emperor of Russia insisted should be yielded to Naples, otherwise he would not undertake to guarantee the order, and would separate from it the priories of Russia. The result of these disputes is well known, as they afforded a reason for renewing the bloody contest which so long desolated Europe.

Prudent regulations in the internal administration of his empire. During the short interval of peace, the emperor of Russia made several prudent regulations in the internal administration of his empire. On the 12th of September 1801, a manifesto had been published, proclaiming the union of Georgia, or Russian Grusinia, with the empire; and on the 1st of April 1802, Alexander sent a deputation to establish the new government at Teflis, the capital of the province. On the 28th of May the emperor wrote a letter to the chamberlain Wittostoff, president of the commission for ameliorating the condition of the poor of St Petersburg, in which he recommended to the commission to follow the example of a similar establishment at Hamburg, in selecting proper objects for their charitable bequests, preferring the humble and industrious pauper to the idle and sturdy beggar. He also offered considerable premiums to persons who should introduce any new or advantageous mode of agriculture, or who should bring to perfection any old invention, open any new branch of commerce, establish any new manufacture, or contrive any machine or process that might be useful in the arts.

An. 1803. Early in the year 1803, the emperor fitted out, at his own expense, two vessels for a voyage of discovery round the world, under the command of Captain Krusenstern. These ships were provided with every necessary for accomplishing the object of the voyage; and several men of eminence for science and literature, among whom was Churchman the American astronomer, volunteered their services on this occasion.

An. 1804. In the beginning of 1804 the emperor established a university at Kharkof, in Lithuania, for the cultivation and diffusion of the arts and sciences in that part of the Russian empire; and Mr Fletcher Campbell, a Scotch gentleman, was employed to procure masters for this new institution. Some time after, the emperor ordered that meteorological observations should be regularly made at all the universities and public schools, and the results published. It appears that at the end of this year the sums allotted by the Russian government for defraying the expenses of these institutions amounted to L.331,337, besides a gift of nearly L.9250 towards erecting the new university.

History.
Emancipation of the Jews in Russia.

About this time an imperial ukase was published, granting to the Jews a complete emancipation from the shackles under which that devoted people had long groaned, and allowing them the privileges of educating their children in any of the schools and universities of the empire, or establishing schools at their own expense.

Dispute with France.

For some time the genius of discord, which had again actuated the minds of the European sovereigns, failed to extend her baleful influence over the Russian empire; but it was scarcely possible that the emperor should long remain an impartial spectator of the renewed disputes between his more powerful neighbours. An important change had, in the latter end of 1802, taken place in the ministry of the empire; and Count Worontzoff, brother of the late ambassador at London, had been appointed great chancellor-in-chief of the department of foreign affairs, with Prince Adam Czartoryski for his assistant. How far this change in the councils of the empire influenced the political measures of the court of St Petersburg, it is not easy to determine; but in the latter end of 1803, Alexander appeared to view with a jealous eye the presumption and violence exercised by France among the German states, and the encroachments which she appeared desirous of making on the freedom of the Baltic. Alexander had offered his mediation between Great Britain and France, but without effect; and both these parties strove to bring over the Russian emperor to their alliance. France seems to have held out to the ambition of Alexander the bait of a partition of the Turkish territories, the dismemberment of which had long been a favourite object with his predecessors. At length, however, the court of London prevailed, and the Russian ambassador, by his master's orders, took leave of the First Consul of the French republic, though without demonstrating any intentions of immediate hostility. A new levy of a hundred thousand men was immediately ordered, to recruit the Russian army; and, to prevent any jealousy on the side of Turkey, assurances were given to the Sublime Porte of the amicable intentions of Russia towards that power.

An. 1805.
Treaty of concert between Great Britain and Russia.

On the 11th of April 1805 a treaty of concert was concluded between Great Britain and Russia, in which the two governments agreed to adopt the most efficacious means for forming a general league of the states of Europe, to be directed against the power of France. From the terms of the treaty, its objects appear to have been, first, the evacuation of the country of Hanover and the north of Germany; secondly, the establishment of the independence of the republics of Holland and Switzerland; thirdly, the re-establishment of the king of Sardinia in Piedmont; fourthly, the future security of the kingdom of Naples, and the complete evacuation of Italy, the island of Elba included, by the French forces; fifthly, the establishment of an order of things in Europe, which might effectually guarantee the security and independence of the different states, and present a solid barrier against future usurpation.

For the prosecution of the great objects of this treaty, it was proposed by the first article that an army of five hundred thousand men should be levied; but in a subsequent separate article, the contracting parties, after observing that it was more desirable than easy to assemble so large a force, agreed that the treaty should be carried into execution as soon as it should be possible to oppose to France an active force of four hundred thousand men. It was understood and stipulated that these troops should be provided by the powers of the continent who should become parties to the league, and subsidies should be granted by Great Britain in the proportion of L.1,250,000 sterling for every hundred thousand men, besides a considerable additional sum for the necessary expense occasioned in bringing them into the field.

About this time the occupation of Genoa by the French,

on the pretence that that republic was too feeble to support itself against the attacks of Great Britain, was communicated to the different courts of Europe, and excited in every quarter the highest indignation. The Emperor Alexander, in particular, was incensed at this new outrage. Such an open violation of those principles which were justly regarded as essential to the general safety, committed not only during the peace of the continent, but when passports had been delivered to his ambassador, in order that a negotiation might be commenced for the purpose of providing for the permanent security and repose of Europe, he considered as an indecent insult to his person and crown. He issued immediate orders for the recall of M. Novosiltzoff; and the messenger despatched upon this occasion was commanded to repair with the utmost diligence to Berlin. M. Novosiltzoff had not yet left that city; he immediately therefore returned his passports to the Prussian minister of state, Baron de Hardenberg, and at the same time delivered, by order of his court, a spirited memorial explanatory of the object of his mission, and of the circumstances which had led to its termination.

The recall of the Russian envoy appeared to be the signal of hostilities on the part of Russia and Austria against France. These hostilities may be said to have commenced and terminated in the autumn of this year. The military operations that distinguished this short but bloody conflict, the rapid successes of the French, the capitulation of Ulm on the 17th of October, the occupation of Vienna by the French on the 12th of the same month, and the sanguinary battle of Austerlitz on the 27th of November, have been already noticed under the head of FRANCE. The consequences of these disastrous events were, first a cessation of hostilities, and at length a treaty of firm alliance between France and Russia. (See FRANCE.)

But before Alexander finally stooped to the imperial eagles of Napoleon, he was determined to make one more effort to preserve his independence. The Russian envoy at Paris, D'Oubril, had hastily concluded a preliminary treaty of peace between his master and the emperor of the French, which he signed at Paris on the 8th of July 1806, and instantly set out for St Petersburg to procure the ratification of his master. When the terms of this convention were laid before the privy council by Alexander, they appeared so derogatory to the interests of Russia, that the emperor refused them his sanction, and declared that the counsellor of state, D'Oubril, when he signed the convention, had not only departed from the instructions he had received, but had acted directly contrary to the sense and intention of the commission with which he had been intrusted. His imperial majesty, however, signified his willingness to renew the negotiations for peace, but only on such terms as were consistent with the dignity of his crown and the interests of his empire.

In the mean time the king of Prussia began, when it was too late, to see the folly and imprudence of the neutrality which he had so long maintained, and he at length prepared to oppose his now feeble efforts to the growing power of France. He brought together in the summer of this year an army of at least two hundred thousand men, near Weimar and Jena, while the French myriads assembled in Franconia and on the frontiers of Saxony. Previously to the commencement of hostilities, his Prussian majesty issued a spirited manifesto, in which he explained his motives for abandoning his plan of neutrality, and appealed to Europe for the justice of his cause. He entered into an alliance with the Emperor Alexander, and with the king of Sweden; and it was expected that these united forces would at length hurl the tyrant of Europe from his throne, or at least compel him to listen to equitable terms of pacification. These expectations were, however, miserably disappointed. The same extraordinary success was still to attend the arms of France,

History.
Open rupture with France.

An. 1806.

Alliance with Prussia against France.

History. and the north of Europe was again condemned to submit in silence to her yoke.

On the 13th of October 1806, the Prussians received a dreadful check at the battle of Jena; and on the 27th of the same month Napoleon entered Berlin. While the French were thus successful, the troops of the Emperor Alexander occupied Prussian Poland, and took up their residence at Warsaw; but they were soon attacked by the French under Murat, who on the 28th entered Warsaw with his cavalry, on which the Russians retreated across the Vistula, burning the bridge over which they had passed. On the 26th of December, a dreadful engagement took place between the Russians commanded by General Benningsen, and the French under Generals Murat, Davoust, and Lannes. The scene of action was at Ostralenka, about sixty miles from Warsaw, and the fighting continued for three days. The loss was immense on both sides, though the advantage appears to have been on the side of the French. According to French accounts, the Russian army lost twelve thousand men in killed and wounded, together with eighty pieces of cannon, and all its ammunition wagons; while the Russian account states the loss of the French at five thousand men.

An. 1807.
Battle of
Eylau.

In the beginning of February 1807, the Russians obtained a partial advantage in the battle of Eylau. According to the account of this battle, given by General de Budberg in a despatch to the Marquis of Douglas, the British ambassador at St Petersburg, the Russian general Benningsen, after having fallen back for the purpose of choosing a position which he judged well adapted for manœuvring the troops under his command, drew up his army at Preussisch Eylau. During four days successively his rear-guard had to withstand several vigorous assaults; and on the 7th of February, at three o'clock in the afternoon, the battle became general throughout the whole line of the main army. The contest was destructive, and night came on before it could be decided. Early on the following morning the French renewed the attack, and the action was contested with obstinacy on both sides; but towards the evening of that day the assailants were repulsed, and the Russian general remained master of the field. In this action Napoleon commanded in person, having under him Augereau, Davoust, Soult, Ney, and Bessières at the head of the imperial guards. The loss of the Russians in that engagement was by themselves stated at above six thousand men, while they estimated that of the French, probably untrue, at nearly double that number.

Battle of
Friedland.

This was the last important stand made by the Russian army. In May, Dantzic, defended by eighteen thousand Russians and Prussians, surrendered to the French. Several actions succeeded at Spanden, at Lamitten, at Guttotadt, and at Heilsberg, in all of which the French had the advantage, till at length, on the 14th of June, the Russians appeared in considerable force upon the bridge of Friedland, whither the French army under Napoleon was advancing. At three in the morning the report of cannon was first heard, and at this time Marshals Lannes and Mortier were engaged with the Russians. After various manœuvres, the Russian troops received a check, and filed off towards Königsberg. In the afternoon the French army drew up in order of battle, having Marshal Ney on the right, Lannes in the centre, and Mortier on the left, while Victor commanded a corps de reserve, consisting of the guards. At half-past five the attack began on the side of Marshal Ney; and notwithstanding the different movements of the Russians to effect a diversion, the French soon carried all before them. The loss of the Russians, according to the usual exaggerations of the French bulletins, was estimated at from ten thousand to fifteen thousand men, and twenty-five of their generals were said to have been killed, wounded, or taken. In consequence of this victory the French became masters of all the

country round Königsberg, and Marshal Soult entered that city in triumph. Thus concluded the campaign in Germany, in which the Russians sustained a loss of at least thirty thousand of their choicest troops.

While these military operations were going forward on the continent of Europe, the emissaries of France were busily employed at Constantinople in exciting the divan to declare against their ancient enemies. They at length succeeded; for on the 30th of December 1806 war with Russia was proclaimed, and twenty-eight regiments of janissaries assembled under the command of the grand vizir. But the disturbances which broke out in the latter end of May 1807 prevented any operations of importance from taking place; and the pacification which was soon concluded between Russia and France, though it did not entirely put a stop to the war between the former power and Turkey, in some measure diminished their hostile preparations.

The defeats which the allied armies had sustained in Prussia and Poland rendered peace, on almost any terms, a desirable object; and Alexander found himself constrained to meet, at least with the appearance of friendship, the conqueror of his armies. Propositions for an armistice had been made by the Prussian general to Murat near Tilsit, and after the battle of Friedland the Russian prince Labanoff had a conference, on similar views, with the prince of Neufchatel, soon after which an armistice was concluded between the French and Russians. On the 25th of June an amicable meeting took place on the river Niemen, between the emperors of France and Russia, and adjoining apartments were fitted up for the reception of both courts in the town of Tilsit. This politic friendship was soon after cemented by the treaty of Tilsit, concluded between the emperor of the French on the one part, and the emperor of Russia and the king of Prussia (whom it despoiled of a fourth of his dominions) on the other, on the 7th and 12th of July in this year. Thenceforth, until Napoleon's star began to wane, Alexander was his firm partisan; and his faithlessness towards his former allies gave them no temptation to repose further confidence in him.

The conclusion of the treaty of Tilsit was notified to the court of London on the 1st of August; and at the same time a proposal was made from his imperial majesty for mediating a peace between France and Britain. This mediation, however, was declined on the part of Great Britain, until his Britannic majesty should be made acquainted with the stipulations of the treaty of Tilsit, and should find them such as might afford him a just hope of the attainment of a secure and honourable peace. This declining of the mediation of Russia was no doubt expected by the court of St Petersburg; but it served as a pretext for binding more closely the alliance between that power and France, by breaking off her connection with Great Britain. Accordingly, in October, Lord Granville Leveson Gower, who had succeeded the Marquis of Douglas as British envoy, received a note from the government, intimating that, as a British ambassador, he could no longer be received at the court of St Petersburg, which he therefore soon after quitted. An embargo was laid on all British vessels in the ports of Russia, and it was peremptorily required by Napoleon and Alexander that Sweden should abandon her alliance with Great Britain.

An additional ground of complaint against the British court was furnished by the attack on Copenhagen, and the seizure of the Danish fleet, in the beginning of September; and though Lord Gower had attempted to justify these measures on the plea of anticipating the French in the same transaction, the emperor of Russia expressed, in the warmest terms, his indignation at what he called an unjust attack on a neutral power. A considerable Russian fleet joined the French; but the combined squadrons were compelled to seek for shelter in the Tagus, where they remain-

History. ed blocked up by the British, till they were surrendered by the convention of Cintra; and another fleet of fifteen sail of the line that proceeded up the Mediterranean, and advanced as far as Trieste, shared a similar fate.

On the 26th of October the emperor of Russia published a declaration, notifying to the powers of Europe that he had broken off all communication between his empire and Great Britain, until the conclusion of a peace between this power and France. In a counter-declaration, published at London on the 10th of December, his Britannic majesty repels the accusations of Russia, while he regrets the interruption of the friendly intercourse between that power and Britain. His majesty justifies his own conduct, and declares, that when the opportunity for peace between Great Britain and Russia shall arrive, he will embrace it with eagerness; satisfied if Russia shall manifest a disposition to return to her ancient feeling of friendship towards Great Britain, to a just consideration of her own true interests, and to a sense of her own dignity as an independent nation.

An. 1808.
Renewed
negotia-
tions with
Britain.

In October 1808, a meeting took place at Erfurt between the emperors of France and Russia, and a letter was drawn up under their signature, addressed to his Britannic majesty. The object of this letter was, to induce the king of Great Britain to enter into negotiations for a general peace, and with that view it was despatched by Count Romanzoff, the Russian minister at Erfurt, to Mr Canning, the British secretary of state for foreign affairs. It was answered by an official note, requiring the emperors, as an indispensable condition of any treaty with Britain, to receive Sweden as a party, to protect the interests of Portugal and of the ex-king of Naples, and to extend the benefits of the projected arrangements to Ferdinand VII. of Spain. These requisitions were evidently quite inconsistent with Napoleon's views; the emperors refused to accede to them; and all hope of accommodation was in the mean time at an end.

**War with
Sweden.**

The demand of concurrence in the views of France and Russia made on Sweden was formally repeated in a declaration of the Emperor Alexander, published at St Petersburg on the 10th of February in this year. In this declaration his imperial majesty intimated to the king of Sweden that he was making preparations to invade his territories; but that he was ready to change the measures he was about to take, to measures of precaution only, if Sweden would, without delay, join Russia and Denmark in shutting the Baltic against Great Britain, until the conclusion of a maritime peace. He professed that nothing could be more painful to him, than to see a rupture take place between Sweden and Russia; but that his Swedish majesty had it still in his power to avoid this event, by resolving without delay to adopt that course which could alone preserve strict union and perfect harmony between the two states.

The king of Sweden, however, determined to abide by the measures which he had for some time pursued, and to adhere to the terms of the convention which had just been concluded between him and the king of Great Britain. In consequence of this determination, a Russian army entered Finland in the beginning of March, under the command of General Buxhovden, and advanced against Helsingfors, which was occupied by a single battalion of a Swedish regiment. This small force retired into the fortress of Sweaborg, where they maintained themselves with great bravery till the 17th of April, when they were obliged to capitulate. The loss of this fortress, though inconsiderable in itself, so highly enraged the king of Sweden, that he dismissed the naval and military commanders who had been concerned in the capitulation.

On the 27th of April, some slight advantage was gained over the Russians near Rivolax, by the Swedish army under General Count Klinckspor; but this was only a partial gleam

of success. The Russians soon overran almost all Finland, took possession of Wasa, Old and New Carleby, and reduced under subjection the whole province of which Wasa is the capital. The army of Field-Marshal Klinckspor, which originally consisted of sixteen thousand regulars, and many boors, was, by the end of the campaign, reduced to little more than nine thousand men.

The king of Sweden sent some reinforcements to his army in Finland; but the forces which should have supported Klinckspor were foolishly employed in a fruitless attempt to conquer Norway; and in 1809 the Swedes were compelled to cede Finland to Russia.

Russia continued to appear in the unworthy character of Napoleon's ally; and when Austria made an effort in 1809 to recover her losses, a Russian army advanced to co-operate with the French. The diversion which this produced was one cause of the final success of Napoleon, whose situation after the battle of Aspern was extremely critical. When Austria was at last compelled to accept of peace on humiliating terms, Russia received as the reward of her services the district of Tarnopol in Galicia, with a population of four hundred thousand souls. This district was restored to Austria in 1815.

In 1811, hostilities commenced between Russia and the Porte. It is of little consequence to inquire into the causes of this rupture; a powerful and ambitious government in the neighbourhood of a weak one never wants pretexts for war. The result might have been serious, if not fatal to the Porte, had not the prospect of a more arduous struggle induced Russia to suspend her efforts in that quarter, and conclude a peace on condition of receiving a part of Moldavia and Bessarabia.

The great contest was now approaching which was to try the resources of Russia, and ultimately to raise her to unexampled greatness. The seizure by France of the territories of the Prince of Oldenburg, who was the emperor of Russia's brother-in-law, on the one hand, and the admission of British produce into the Russian harbours on the other, furnished the ostensible grounds of the quarrel. After some fruitless negotiations, Napoleon dismissed the Russian ambassador, and left Paris to join the army on the 9th of May 1812. The events of this disastrous expedition into Russia have been minutely related in the article FRANCE; and the reader does not require to be reminded of those lamentable sufferings of the French army, which were its principal result. The spirited resistance of Russia now roused Prussia and Austria; and early in 1813 a league was formed between these powers, to which Bavaria and other small states acceded. The battle of Leipsic, fought on the 18th of October, led to the final overthrow of the French domination. In all the transactions which followed, Russia bore a leading part. At the congress of Vienna in 1814, the duchy of Warsaw, consisting of part of the original conquests of Austria and Prussia in Poland, was assigned to Russia, which thus ultimately obtained about four fifths of the territory and three fourths of the population of that ancient kingdom.

In passing to the new system of foreign policy which has prevailed in Russia, as well as in the rest of Europe, since the year 1815, we must pause for a moment to remark the accessions of territory which the empire had made during the half century which preceded that epoch. The reign of Catherine II. had, as we have seen, been by far the most fertile in foreign acquisitions. Her conquests included the Crimea, which was an incorporated portion of Russia since 1783; Georgia, gained in 1785, though, as we have observed, not formally annexed till 1801; Bessarabia, with a part of Moldavia, and other Turkish possessions, finally secured to Russia by the treaty of Bukarescht in 1812; Courland, acquired in 1795; and the extensive spoils of Poland in 1793 and 1794. Paul's reign made no permanent addition of import-

History. ance, except some districts within the Persian frontier. Alexander's gave to Russia in the first years of the present century several of the tribes of the Caucasus; Finland in 1809; Daghestan and other large territories ceded by Persia in 1813; and in 1814, Napoleon's grand duchy of Warsaw, which was erected into a kingdom of Poland. The total population of these new Russian provinces cannot at the very least be estimated under fifteen millions, and probably exceeds that number.

Alexander's foreign policy after 1815.

During the ten years of Alexander's reign which succeeded the peace, and ended with his death in 1825, he acquired no new territory as a substantive addition to his dominions, but occupied himself assiduously in that indirect augmentation of Russian influence on the states around the frontier, which had before his time formed, and has since continued to form, the first step in all the schemes of conquest projected by his ambitious nation. The objects of Alexander's foreign policy after 1815 were chiefly three; the suppression of constitutional, or, as they were called by preference, revolutionary movements, in the central and southern states of Europe; the weakening of Turkey, and the gradual reduction of that power into a state of dependence on the cabinet of St Petersburg, so as to pave the way for the Russians towards the sovereignty of the Levant; and the extension of the Russian influence in Persia and those adjacent states, which must form the stepping-stones by which the Muscovites will strive to pass, if they shall ever make the attempt, to the throne of British India. For the attainment of the first of these great ends, there was formed, under the guidance and by the suggestion of Alexander, that league of princes which has been named the Holy Alliance; a confederacy whose bitter fruits have been tasted in full measure by Italy and Spain, but whose conception is in one view an encouraging tribute to the growing enlightenment of the world, since it is the earliest instance in which despots, conspiring against truth and freedom, have condescended to speak the language of Christianity and peace. In reference to Turkey, the policy of Alexander aimed at gradually detaching the Porte from its friendly relations with Great Britain and other European powers, and insidiously advancing towards a position in which the sultan should find himself powerless against his neighbours and his own subjects, until Russia should stretch forth her protecting hand; but a check was administered to this train of diplomacy, and a peculiar relation introduced between the courts of Constantinople and St Petersburg, by the insurrection of Greece in 1821. To the founder and head of the Holy Alliance the Greeks must have appeared to be mere rebels, whom it was his duty as a neighbouring sovereign to assist in punishing; while to the watchful power which desired by every available means to weaken and circumscribe the power of Turkey, such an opportunity as the Greek revolution was unusually tempting, and indeed the sultan's ministers openly alleged that the disturbances had been fomented by Russian agents. The result of the rising in Greece has been related in our article on that country; and the other misunderstandings between Russia and Turkey, the principal of which related to the appointment of the hospodars in Wallachia and Moldavia, were not sufficient to disturb the diplomatic system which was resumed after the Greek question had been settled by the interposition of the other great European powers. The designs of the emperor on the side of India chiefly exhibited themselves in intrigues among the northern neighbours of our possessions in that country; and the system scarcely came to light till after Alexander's death.

Alexander's internal government. In the internal government of the empire, Alexander introduced many salutary changes, especially in the early part of his reign; but here, not less than in his foreign policy, the last ten years of his life exhibited a marked contrast to its earlier portion. The transition in his mind from a

love of liberal institutions to a distrust of every thing that seemed to threaten the stability of thrones, began almost with his alliance with Napoleon, but reached full maturity after that extraordinary man's fall. In the first year of his reign he abolished the literary censorship, and afterwards restored it with less absurd but not less severe rules than those of his father. He at one time patronized both the education of the young and the general dissemination of religious knowledge; but after the peace the missionary societies were suppressed, and very harsh measures adopted against the universities. In several particulars a better spirit prevailed. That tolerant disposition towards the various sects of Christianity, of which we have remarked more than one instance in passing, had already become systematic, and was never departed from. The emancipation of the peasants from their state of serfdom was long a favourite object with the emperor, who was able to attain it in Courland, Livonia, and one or two other provinces, and used openly to lament that private interests and prejudices had baffled his good intentions elsewhere. Another plan of his, which was connected with the scheme just mentioned, was that of the military colonies, of which Dr Lyall has published an interesting account. The advantages which this system promised to confer were these: the diminution of the expenses of the army in times of peace, and the easy training of a large agricultural population to the trade of war. For these purposes villages were built on the crown-estates along the western frontier of the empire, and in these, soon after the peace, formidable detachments of soldiers were settled with their families, and mixed among the boors who, belonging to the crown, had previously been the sole or the principal inhabitants of the districts. The whole male population of these new settlements was to occupy itself alternately in rural labour and military exercises; and while the troops who had already seen service were always in a position to take the field again, the boors were gradually to qualify themselves for acting as a corps de reserve, and for filling up vacancies. The plan excited considerable opposition; and although the obstacles were finally to appearance vanquished, and the colonies speedily mustered four hundred thousand fighting men, yet new difficulties arose after his death, and his successor at length abandoned the idea of extending the principle, or of making it permanent.

During the last few years of Alexander's life he appears to have been completely miserable. To family misfortunes, religious despondency, and disappointment in political schemes, was added the continual terror of conspiracies in the heart of the empire, which were said to have ramifications everywhere, and to aim at nothing less than a total revolution, and the assassination of the whole royal family. Those constant travels through the several Russian provinces in which Alexander was engaged for two or three years before his death, have been mainly attributed by some writers to his dread of poison or the dagger. In the course of one of these journeys he died at Taganrog, on the Sea of Azof, on the 1st day of December 1825.

Alexander's brother, the Grand Duke Constantine, whose conduct as governor of Poland has been described in our article on the history of that country, was immediately proclaimed emperor at St Petersburg; and whatever may have been the feelings of the Russians themselves, foreigners who were acquainted with the new sovereign by his general reputation, looked on his accession with pity for his subjects and alarm for the peace of Europe. But the danger had been foreseen and averted by Alexander and the rest of the family. Constantine had been induced to resign his claims to the crown by a formal deed executed in 1822. The senate, on opening the will of Alexander, found it to contain a nomination of his second brother, the Grand Duke Nicholas, as his successor in the empire. The act of resigna-

Resignation of the Grand Duke Constantine.

History.

nation was at the same time discovered, and in a few days there arrived from Warsaw a communication from Constantine, in which he acknowledged the existence and validity of the deed, and anew waived his right of succession.

Nicholas I.

Accordingly Nicholas I. ascended the throne, announcing the event by a proclamation of the 23d of December 1825. The disturbance of the natural order of succession was seized by the discontented as a favourable pretext for insurrection; and the reign of the new emperor was opened by a military mutiny in St Petersburg, which, after having been suppressed with bloodshed, was followed by several executions, and many imprisonments and banishments to Siberia. Nicholas and his spouse, the princess-royal of Prussia, were crowned at Moscow in 1826, and at Warsaw in 1829. Scarcely had Nicholas ascended the throne when war was declared against Persia. It originated in a dispute respecting the boundaries between the two countries, and was continued till 1828, when the Persians were obliged to sue for peace. This was only granted them on condition of their yielding up the provinces of Erivan and Nakshivan, and paying about L.3,000,000 sterling to account of the war. The peace of Turkmanchai was concluded in February 1828, and in May of the same year the war with Turkey broke out. In that month a Russian force of about 150,000 men, under the command of General Wittgenstein, crossed the Pruth at three different points, took possession of Jassy, Bucharest, and Galatz, and in a few weeks occupied the whole of the left bank of the Danube. It was resolved to cross the river at Braila; and in order to accomplish this, the army was formed into two divisions, one of which invested the town, while the other successfully crossed the river and continued its march southward. In the meantime, the siege of Braila continued, and after a series of sanguinary assaults the garrison capitulated. The besieging force then crossed the Danube, and in a short time all the Dobroudscha was in the possession of the Russians. An attempt upon Shumla failed, though in the first instance directed by the czar in person. They were more successful, however, with Varna, which surrendered on 10th October, after a vigorous defence of more than two months. The utmost efforts were now made to reduce Silistria; but from the advanced state of the season, and the difficulties of the attempt, nothing of importance could be effected; and the Russians retired beyond the Danube to winter in Wallachia. Notwithstanding the success of this campaign, it had been attended with a great loss of life to the Russians. A number had fallen by the hand of the Turks, but many more fell by disease; so that of the number that crossed the Danube not more than one-half remained.

War with
Turkey,
1828-9.

Meanwhile, in Asia operations had been carried on with equal vigour, and with even a greater measure of success, under General Paskievitch. His force consisted of about 21,000 infantry and 5500 cavalry. In the brief space of a week he invested and took Kars, one of the strongest and most formidable fortresses in Asia, obtaining thereby a large store of ammunition, a number of cannon, and 7000 prisoners. This was on the 15th of July; and Poti, a fortress on the east coast of the Black Sea, surrendered on the 26th. The general now resolved to attack the town and fortress of Akhalzik, a place strongly fortified both by nature and art, and defended by a garrison of 10,000 men. A battle was fought under the walls of the town on 4th September, when the Turkish army, though greatly inferior in numbers, fought with great bravery, but was defeated with much slaughter. The Russians now prosecuted the siege with vigour, and a breach was at length effected in the walls. The assault was made on the 7th of September, but such was the desperate valour of the Turks, that not till the city was reduced to a heap of ashes, and a great number of its defenders destroyed, could the survivors be

brought to capitulate. The surrender of Akhalzik was followed by that of other important fortresses in Asia before the close of the campaign of 1828.

History.

Both sides now made vigorous exertions for the renewal of hostilities in the following spring. Troops were summoned from various parts of the Turkish empire, and the garrison of Shumla was augmented from 10,000 to 40,000. The Russian force was strengthened by an addition of 70,000, and the command entrusted to Count Diebitsch, an officer of high military attainments, General Wittgenstein having retired from active service. On the 10th of May 1829 the Russians again crossed the Danube, and immediately besieged Silistria, while General Kouprianoff was stationed with a force at Pravadi, a fortress on the east of Shumla, and important as lying in the line of communication between Silistria and Varna. Redschid Pasha, who had been appointed commander-in-chief, perceiving the position of the invading army, formed the design of attacking Pravadi and Varna, which would also have the effect of drawing off the troops from Silistria. He accordingly set out from Shumla at the head of 36,000 men, leaving only a small garrison behind him under Ibrahim Pasha, and advanced rapidly on Pravadi. General Diebitsch, however, on being informed of his design, instead of advancing to meet him at Pravadi resolved to cut off his communication with Shumla; and accordingly, leaving one of his generals to continue the siege, he hastened southward at the head of 20,000 men to put his design in execution, and sent word to General Roth at Varna to co-operate with him. He took up a favourable position near Koulevscha, a village between Pravadi and Shumla, scarcely 3 miles from the latter. His army was posted on the hills on each side of the road through which the Turkish army had to pass on their return to Shumla, and so concealed that only a very small portion of them were visible. Redschid, not knowing that Diebitsch had quitted Silistria, and believing that his opponents were only a portion of the army at Varna, did not hesitate to force his passage, sending a body of cavalry to disperse the enemy. He soon found out his mistake, for the Russian army rushing down upon them in a body, instantly put them to flight. Every attempt to bring them to a stand proved abortive, and Redschid himself escaped with difficulty. The artillery and baggage fell into the hands of the enemy; but the loss of men to the Turks was by no means so great as might have been expected, the killed, wounded, and prisoners amounting only to about 6500. Had Count Diebitsch immediately on this victory attacked Shumla, he would in all probability have taken it; but instead of this, he contented himself with some minor operations, till the grand vizier, with the scattered remains of his army, had thrown himself into the town. After the battle of Koulevscha, the siege of Silistria was carried on with redoubled vigour; and on the 30th of June the fortress surrendered, when the whole garrison, amounting to about 8000 men, were made prisoners of war. The fall of Silistria now determined the Russian general to cross the Balkan. Leaving, therefore, a body of troops before Shumla, he set out for Aidos on the 17th of July. The town of Sizoboli, on the other side of the Balkans, having one of the best and safest harbours on the western shores of the Black Sea, had been already seized by a naval *coup de main* to form a dépôt where the troops might refresh themselves for a short time after their arduous undertaking. The Russians crossed the Balkans without opposition, the Turks everywhere fleeing before them. Towards the end of July, when General Rudiger, with his division, was advancing on Aidos, a body of 10,000 or 12,000 men were sent out to attack him, but as soon as their skirmishers were beaten back, the Turks fled in precipitation, passing through the town, which they left to the enemy without firing a shot. Here the Russians obtained

History. an immense booty of ammunition and military stores. After this it is not to be wondered at that the Russians soon found themselves within sight of Adrianople. During their progress they had scarcely met with an appearance of opposition, whereas had only a feeble stand been made at some of the Balkan passes, or even afterwards, it would have been impossible for the Russians to have advanced. Yea, even had they been harassed by small parties of the enemy during their march, they could not have ventured to Adrianople. As it was, they were now unable to attempt any active operations. Their force, originally small, was now weakened by sickness and fatigue, while hundreds of them were dying daily. Diebitsch, however, carefully concealed his real condition from the Turks, and by acting on their fear and ignorance he was able to obtain terms of peace as a conqueror.

In the meantime, General Paskievitch was following up his brilliant successes in the Asiatic portion of the sultan's dominions. One of the first operations of the Turkish army was an attempt to recover the fortress of Akhalzik, which, notwithstanding the valour displayed by the sultan's forces, was in vain. General Paskievitch anticipated every movement, and defeated every attack. On the 1st of July, anticipating the junction of the seraskier of Erzeroom with Hagki Pasha in the valley of Zevine, he marched first against the former, whom he put to flight, and on the next day defeated the latter, whom he made prisoner. In these two actions the Russians took about 1500 prisoners, with a large quantity of artillery, ammunition, and provisions. Paskievitch now pushed on with all possible rapidity to Erzeroom; and on the 5th of July took the strong fortress of Hassan Kale, the key of that capital. After a feeble resistance, Erzeroom surrendered on the 9th of July, and in it was found 150 cannon, and large magazines of ammunition and provisions. The seraskier himself and four of his pashas were made prisoners. The Russian commander next directed his movements towards Trebizond, and on the 19th of July took Baibout, a fortified town on the road to Trebizond. The pasha of Trebizond having collected a body of troops, set out to attack the Russians; and General Bursow, who commanded in Baibout, marched out to meet him, and attacked him on the 30th July near the village of Chart. The Russians being greatly inferior in numbers, were repulsed with the loss of their commander. On learning of this reverse, Count Paskievitch brought up the main body of his army and attacked the Turkish camp on the 8th of August. A series of severe engagements took place on that and the following day, which terminated in the Russians carrying the entrenched camp of the enemy, who fell back in confusion upon Trebizond. It was at this stage of his victorious course that Paskievitch received intelligence that the war was at an end.

Treaty of Adrianople The celebrated treaty of Ardianople, which concluded the war of 1828-9, was signed 14th September 1829, and contained sixteen distinct articles, the substance of which was as follows:—The principalities of Wallachia and Moldavia, and all the conquered places in Bulgaria and Roumelia were to be restored to the Porte, with the exception of the islands at the mouth of the Danube, which were to remain in possession of Russia, the Pruth continuing to form the boundary of the two empires, from the point where that river touches the territory of Moldavia to its mouth in the Danube, and thence the boundary-line was to be the Danube and its southernmost mouth, St George. In Asia the boundary between the two countries was to be the line which, following the present boundary of the province of Gouriel from the Black Sea, ascends to that of Imeritia, and thence in the most direct line to the point where the frontiers of the pashalics of Akhalzik and of Kars unite with those of Georgia, Russia thus acquiring that portion

History. of the coast of the Black Sea lying between the mouth of the Kouban and the port of St Nicholas inclusively, comprising a considerable extent of country, and the forts of Anapa, Akhalzik, and others. The principalities of Moldavia and Wallachia were to enjoy the free exercise of their worship, perfect security, an independent national government, and full liberty of commerce; and the conditions of previous treaties were to be implemented regarding Servia. Russian subjects should enjoy throughout Turkey, as well by land as by sea, the full and entire freedom of trade guaranteed to them by previous treaties; and were to be under the exclusive jurisdiction of the Russian ministers and consuls. Russian ships were not to be subjected to any search by the Turks either at sea or in port. The trade and navigation of the Black Sea were to be impeded in no manner, and the passage of the Strait of Constantinople and of the Dardanelles was declared to be entirely free and open to all Russian vessels, and to all vessels trading with Russia belonging to powers at peace with the Porte. An indemnity of L.750,000 was to be paid to the Russian government for losses incurred at various times by Russian merchants and others. The Russian government was also to receive a sum of money, the amount of which was to be afterwards fixed, as indemnification for the expenses of the war. Russia was not to evacuate the territories of which she had taken possession till the articles relative to the European and Asiatic boundaries, and the privileges of Wallachia, Moldavia, and Servia, "could be considered as fulfilled," and until the complete evacuation of the territories occupied by the Russian troops; the administration and the order of things established under the influence of the court of Russia was to be maintained, and the Porte was bound not to interfere with them in any manner. To this treaty two separate acts were annexed, explanatory of some of its most important conditions, which bore much harder upon Turkey, and betrayed a much more grasping and insidious disposition on the part of Russia than the treaty itself. One of these related to the amount of the indemnification to be paid to Russia, and which was now fixed at the exorbitant sum of L.5,000,000 sterling, to be paid in ten equal annual instalments of half-a-million each. The smaller sum of L.750,000 was to be paid in four separate instalments: the sum of L.50,000 upon the ratification of the treaty, L.200,000 within six months, L.250,000 in the six months following, and the last instalment of L.250,000 in the next six months. Within the space of one month after payment of the first instalment the Russians were to evacuate Adrianople; within a month after the second payment they were to retreat across the Balkan; on the third payment they were to cross the Danube, but they were to retain possession of Moldavia, Wallachia, and Silistria, till the balance of this as well as the whole of the other sum of L.5,000,000 were paid. Thus the possession of the Principalities was secured to her for at least ten years, and the treaty had already provided that while she remained in possession the order of things established by her could not be interfered with. By the other supplementary article alterations of great importance, and permanent in their nature, were introduced into the administration of the Principalities themselves. The hospodars were to be elected for life instead of for seven years as previously. They were to govern within their respective principalities as they and their divans might think proper, without being interfered with in any manner by the Porte or any of its officers. The Turkish government relinquished all claim to those contributions in kind which it had hitherto received from the Principalities; and as an indemnification for this sacrifice, it was to be allowed an annual sum of money, the amount of which was to be afterwards determined, but which, as well as the regular tribute, was not to commence until two years after the

History.

total evacuation of the Principalities by the Russian troops. Further, the Porte was to surrender everything on the left bank of the Danube to the Principalities,—cities, fortresses, and lands; not a single Mussulman being allowed to reside there, and such as already possessed soil there were required to dispose of it within the space of eighteen months. The manifest object of these articles was to weaken the power of the Porte over these principalities, and to pave the way for their annexation to Russia.

Polish insurrection.

Nicholas was crowned at Warsaw on the 24th of May 1829; and on the 29th of November 1830 the Polish insurrection broke out, an account of which has already been given. (See POLAND.) The Poles stood unaided and alone, and displayed bravery worthy of any age or country. General Diebitsch perished in the struggle, the victim of disease, chagrin, and fatigue, and was succeeded in the command by Paskievitch. The war was brought to an end by the celebrated battle of Warsaw, fought on the 5th, 6th, and 7th of September 1831. The Poles submitted; and fearful was the vengeance taken by Nicholas upon his prostrate foe. Every species of punishment was inflicted upon the vanquished, and neither property nor the ties of family were respected. Siberia, the Caucasus, and the army were the lot of multitudes of these unhappy beings, and every attempt was made to destroy every sentiment or vestige of nationality. The Russian division of governments was substituted for the Polish division of palatinates, the Russian weights and measures for those of Poland, and the old Julian calendar for the modern one. It was further attempted to banish the Polish language out of the country by commanding the use of the Russian language in the schools, and forbidding the youth to speak in their own native tongue, suppressing its use in the different administrations, and dismissing those functionaries who were unacquainted with Russian.

Caucasian struggle.

The territory ceded to Russia by the treaty of Adrianople included the Caucasus, a mountainous region inhabited by several independent races who owed no allegiance to the sultan, and who therefore refused to acknowledge the supremacy of Russia. Nicholas at first endeavoured to gain over the chiefs of the various tribes by means of military appointments, decorations, and pensions, but these being ineffectual, he at length had recourse to arms. The two tribes who have come most prominently forward in this struggle are the Lesghians and the Circassians; and though the contest has been going on with little intermission for nearly thirty years, at an enormous expense of men and money, the Russians have yet been able to effect little of permanent advantage. (See CAUCASUS, and CIRCASSIA.)

Farther treaties.

The revolt of the Pasha of Egypt, and the series of successes that attended the advance of his son Ibrahim Pasha, rendered it necessary for the sultan to apply for aid to his old enemy the czar. This was readily granted; and on peace being established, the treaty of Unkiar-Skelessi was entered into between the sultan and the Emperor of Russia. This treaty, which was signed at Constantinople on the 8th of July 1833, purported to be a defensive alliance between the two contracting powers; but its real import was expressed in a separate and secret article, which provided that, as the Emperor of Russia was willing to spare his ally the expense and inconvenience of affording him military aid, "the Sublime Ottoman Porte, in place of the aid which it is bound to furnish in case of need, according to the principle of reciprocity of the patent treaty, shall confine its action in favour of the imperial court of Russia to closing the Strait of the Dardanelles; that is to say, to not allowing any foreign vessels of war to enter therein under any pretext whatsoever." In 1834 another treaty was entered into between these two powers, by which the sultan ceded to the czar an extensive district in Asia, in consideration of which the czar relinquished his right to three-fourths of

History.

what remained to be paid of the indemnities fixed by the treaty of Adrianople, and agreed to leave the Principalities as soon as hospodars shall be chosen, the Sublime Porte formally recognising the regulations made, while the Russian troops occupied these provinces, by the principal inhabitants for their internal administration. In addition to these stipulations, the free passage of the Dardanelles was permitted to Russian ships. Silistria, however, still remained in the hands of Russia; and it was not till 1836, when it was agreed that it should be given up upon payment of one-half of the balance still remaining due to the czar, that the Turks obtained possession of this important fortress.

The peace between the Sultan and the Pasha of Egypt was not of long duration, and the war broke out afresh in 1839. (See TURKEY.) At length England and France interfered in behalf of the Sultan; and on the 27th of July 1839 a note was signed, by which the Ottoman empire was placed under the common safeguard of the five great European powers,—England, France, Prussia, Russia, and Austria, instead of exclusively under the protectorate of Russia. This was followed by a convention, signed at London on the 15th of July 1840, for "maintaining the integrity and independence of the Ottoman empire, as a security for the peace of Europe." The allies bound themselves to unite their efforts in order to bring about peace; and the Sultan, on his part, declared it to be his firm resolution to adhere to the ancient rule of the Ottoman empire, which prohibited ships of war of foreign powers from entering the Straits of the Dardanelles and the Bosphorus,—thus virtually setting aside the treaty of Unkiar-Skelessi.

In 1840 an expedition was fitted out against Khiva; but 1840-50, after encountering numerous obstacles and suffering many disasters, it was obliged to return without being able to get beyond the Russian frontier. In the beginning of June 1844 the emperor spent eight days in England. In February 1846 an insurrection broke out in Cracow, which had been established as an independent state under the protection of Russia, Prussia, and Austria by the treaty of Vienna in 1815. The town was immediately seized upon by the allied troops, and by agreement between the three powers it was annexed to Austria; and thus this last remnant of independent Poland was abolished. Soon after, the Russian portion of Poland was entirely incorporated with the empire, and made a Russian province. During the time of the revolution in Germany in 1848 Russia stood quite aloof, and the emperor contented himself with strengthening his army at all points, and watching, without taking part in the events that filled all Europe with astonishment. In 1849, however, she readily responded to the call of Austria for aid against the Hungarians, and sent a powerful army into the country. This turned the scale in favour of Austria, whose forces had previously been several times beaten and driven out of the country. (See HUNGARY.) After the fall of Hungary a number of the civil and military leaders, and others, took refuge in Turkey. Russia and Austria demanded the expulsion of the refugees, but this was peremptorily refused by the sultan. The Emperor of Russia attempted to threaten him into compliance, and even suspended all diplomatic intercourse between the two countries; but the appearance of a British fleet in the Dardanelles induced him to lower his tone, and he contented himself with requiring that they should be removed to a distant part of the empire.

Before entering upon the last important event in the reign of Nicholas, it may be necessary to glance shortly at the general character of his policy. In this respect he has followed the course pursued by his brother since the peace of 1815, but with an additional degree of force and boldness, which may be attributable partly to the natural progress of the political tactics which were common to both, and partly to the more energetic will, and greater attachment to mili-

Policy of Nicholas.

History. tary principles and forms, which distinguished the younger brother. Nicholas was in moral endowments far behind his predecessor. In his political principles he was strictly despotic, and when necessary carried these out with unmitigated cruelty. His favourite pursuits were those connected with the military sciences and military operations; but he had also a taste for the fine arts and for music. He was upwards of six feet in height, muscular, and well-proportioned, and was admitted to be one of the handsomest men in his empire. His features, however, were stern and severe; and his manner was cold, inanimate, and without grace. In his personal habits he was simple, abstemious, and of indefatigable industry. In foreign policy his great object was the extension of the Russian empire by unscrupulous diplomacy, and when that failed, by war. If we look at the three questions which were described above as forming the main business of Alexander in his foreign policy, we find the position of Russia regarding them to have remained, with slight alterations, the same. The anti-constitutional views of the Holy Alliance were necessarily modified, but not abandoned. Turkey had been reduced to a state of servile and helpless dependence till the other powers of Europe stepped in for its defence. In the direction of Persia, and undoubtedly not without an eye towards India, Russia was likewise rapidly extending her dominion. The domestic government of Nicholas had little to distinguish it from that of his brother. Education was to some extent more favoured than it had recently been by Alexander; the Catholic and Lutheran churches continued to receive the support of the government, which also lent its aid to missions to the Calmucks and other nomadic hordes; trade and manufactures had been furthered by regulations devised with much liberality; and the laws since 1826 had received a tolerably complete revision and concentration.

History of the late war with Turkey.

Russia had been looking for an occasion of quarrel with Turkey long before the outbreak of the late war, and there can be little doubt that a chief object of his imperial majesty's visit to England in 1844 was to come to some arrangement with the British government as to the Turkish empire. On that occasion he had several conversations with the Duke of Wellington and the Earl of Aberdeen, who was then foreign secretary, relative to the state of Turkey; and on his return to Russia his views on that subject were embodied in a memorandum, drawn up by his chancellor Count Nesselrode, and forwarded to the British government. This document, read in the light which subsequent events have thrown upon it, shows clearly that even at that time the czar had been looking forward to a war with Turkey at no distant period, and was endeavouring to obtain the countenance, or at least to lull the suspicions, of England in such a case. It states that it was for the interest of both that they should unite in maintaining the integrity of the Turkish empire; but that the Porte had a constant tendency to free itself from the engagements imposed upon it by treaties concluded with other powers, and that it reckoned upon the mutual jealousies of the cabinets to enable it to do so with impunity. It was essential not to confirm the Porte in this delusion, but to exhort it to act rightly towards the cabinet demanding its just rights; and the Porte, on perceiving that it was not supported by the other cabinets, would give way, and consent to an amicable arrangement of the differences. Another difficulty existed in reconciling the respect due to the sovereign authority of the sultan, founded on the Mussulman law, with the forbearance required by the interests of the Christian population of the empire; and it was necessary ever to impress upon the Porte that it could only reckon upon the support of the great powers while it treated its Christian subjects with mildness and toleration. It was by all the great powers pursuing this line of policy that they would be most likely to preserve the existence of Turkey; but at the same

time that empire contains within itself so many elements of dissolution, that unforeseen circumstances may hasten its fall without it being in the power of friendly cabinets to prevent it, and the danger which may result from such a catastrophe will be much diminished if, in the event of its occurring, Russia and England shall have come to an understanding as to the course to be taken by them in common. That understanding would also have the full assent of Austria, as between her and Russia there exists already an entire conformity of principles in regard to the affairs of Turkey. It concludes as follows:—"The object for which Russia and England will have to come to an understanding may be expressed in the following manner: (1.) To seek to maintain the existence of the Ottoman empire in its present state so long as that political combination shall be possible. (2.) If we foresee that it must crumble to pieces, to enter into previous concert as to everything relating to the establishment of a new order of things intended to replace that which now exists, and in conjunction with each other to see that the change which may have occurred in the internal situation of that empire shall not injuriously affect either the security of their own state, and the rights which the treaties assure to them respectively, or the maintenance of the balance of power in Europe. For the purpose thus stated the policy of Russia and Austria, as we have already said, is closely united by the principle of perfect identity. If England, as the principal maritime power, acts in concert with them, it is to be supposed that France will find herself obliged to act in conformity with the course agreed upon between St Petersburg, London, and Vienna. Conflict between the great powers being thus obviated, it is to be hoped that the peace of Europe will be maintained even in the midst of such serious circumstances. It is to secure this object of common interest, if the case occurs, that, as the emperor agreed with her Britannic Majesty's ministers during his residence in England, the previous understanding which Russia and England shall establish between themselves must be directed." In the early part of 1853 his imperial majesty had several interviews with the British ambassador at his court, which plainly show his intentions with regard to Turkey, and that he thought the time of her dissolution had arrived. "Turkey," he said, "has by degrees fallen into such a state of decrepitude, that, as I told you the other night, eager as we all are for the prolonged existence of the man (and that I am as desirous as you can be for the continuance of his life I beg you to believe), he may suddenly die upon our hands; we cannot resuscitate what is dead: if the Turkish empire falls, it falls to rise no more. And I put it to you, therefore, whether it is not better to be provided beforehand for a contingency than to incur the chaos, confusion, and the certainty of a European war, all of which must attend the catastrophe, if it should occur unexpectedly, and before some ulterior system has been sketched? This is the point to which I am desirous that you should call the attention of your government." "If your government has been led to believe that Turkey retains any elements of existence, your government must have received incorrect information. I repeat to you that the sick man is dying, and we can never allow such an event to take us by surprise." "I am not so eager about what shall be done when the sick man dies as I am to determine with England what shall not be done upon that event taking place." When requested to explain his own ideas upon this negative policy, he for some time declined doing so; but at length said, "Well, there are several things which I never will tolerate: I will begin by ourselves. I will not tolerate the permanent occupation of Constantinople by the Russians. Having said this, I will say that it never shall be held by the English or French, or any other great nation. Again, I never will permit an attempt at the re-construction of a Byzantine empire, or

History.

History.

such an extension of Greece as would render her a powerful state; still less will I permit the breaking up of Turkey into little republics, asylums for the Kossuths, and Mazzinis, and other revolutionists of Europe. Rather than submit to any of these arrangements I would go to war; and as long as I have a man and a musket left, would carry it on." The emperor went on to say that, in the event of a dissolution of the Ottoman empire, he thought it might be less difficult to arrive at a satisfactory territorial arrangement than was commonly believed. "The Principalities are," he said, "in fact an independent state under my protection; this might so continue. Servia might receive the same form of government. So again with Bulgaria. There seems to be no reason why this province should not form an independent state. As to Egypt, I quite understand the importance to England of that territory. I can then only say that if, in the event of a distribution of the Ottoman succession upon the fall of the empire, you should take possession of Egypt, I shall have no objection to offer. I would say the same thing of Candia; that island might suit you, and I do not know why it should not become an English possession."

The Greek question.

At this time a dispute was going on between the Greek and Latin churches relative to the guardianship of the holy places in Palestine, and Russia warmly espoused the cause of the former. At length, however, this question was brought to an apparent settlement, chiefly through the unremitting efforts of Lord Stratford de Redcliffe, her British Majesty's ambassador at Constantinople. But while the Russian government was holding out that the mission of Menschikoff to Constantinople was exclusively for the purpose of effecting a settlement of the dispute regarding the holy places, that minister was pressing upon the Porte other demands of a far more serious and important character, which, if complied with, would have had the effect of virtually admitting the sovereignty of the emperor over the Greek Church in Turkey. This the sultan refused to do; and Prince Menschikoff quitted Constantinople on the 21st of May 1853, declaring that the refusal of his demands would impose upon his government the necessity of seeking a guarantee by its own power. On the 28th of the same month an official note was transmitted by the Turkish government to the different embassies of the foreign powers, in which it said: "The Porte announces that the question of the holy places has terminated in a manner satisfactory to all parties; nevertheless the Prince Menschikoff, not satisfied with that, has demanded of the Porte a treaty to guarantee the rights and privileges of all kinds accorded by the sultan to his Greek subjects. However great may be the desire of the Porte to cherish and preserve more and more the most amicable relations with Russia, she can never engage herself by such a guarantee towards a foreign government, either concluding with it a treaty, or signing a simple official note, without compromising gravely her independence, and the most fundamental rights of the sultan over his own subjects."¹

The emperor based his claim to interpose himself as protector of the Greek Church in Turkey on the treaty of Kainardji, concluded in 1774; but the only parts of that treaty bearing upon the Christian religion are contained in the 7th and 14th articles, and they do not afford the smallest countenance to the claim of the emperor to interfere in behalf of the religious privileges of the Christians throughout the Ottoman empire. In the 7th article of the treaty "the Sublime Porte promises to protect constantly the Christian religion and its churches; and also it allows the ministers of the imperial court of Russia to make on all

occasions representations as well in favour of the new church at Constantinople, of which mention will be made in the 14th article, as in favour of those who officiate therein." And by article 14th "it is permitted to the high court of Russia, in addition to the chapel built in the house of the minister, to construct in the Galata quarter, in the street called Bey Oglu, a public church of the Greek rite, which shall be always under the protection of the minister of that empire, and shielded from all obstruction and all damage." It will be observed that here the Porte does not promise to allow Russia to interfere for the protection of the Christian religion and its churches, but to afford that protection itself; and the only right of protection accorded to Russia is limited to a chapel and a church at Constantinople. In a note of 31st May Count Nesselrode intimated to Reschid Pasha that in a few weeks the Russian forces would receive orders to cross the frontier and occupy the Principalities, not to wage war, but until the Ottoman government should give to Russia the moral securities she had in vain demanded. No time was lost in putting this threat into execution; and on the 2d and 3d of July two divisions of Russian troops, amounting to 80,000 men, under the command of Prince Gortschakoff, crossed the Pruthi, one at Skoalani and the other at Leovd. The news of this proceeding caused great excitement at Constantinople; and a formal protest against the invasion of the Moldo-Wallachian provinces was drawn up by the Ottoman Porte, and issued on the 14th of July. Its tone was conciliatory, but at the same time firm; and it stated that the Sublime Porte "is still disposed, if an arrangement of a nature to satisfy Russia can be arrived at without prejudice to the sacred rights of the sultan, to send an ambassador extraordinary to St Petersburg to seek in concert with the Russian cabinet the means of arriving at that end." On the 1st of June a despatch was forwarded by her Majesty's government to Lord Stratford de Redcliffe, authorizing him in certain specific contingencies to send for the fleet; and instructions were also sent to Admiral Dundas to proceed to the neighbourhood of the Dardanelles, and there to place himself in communication with her Majesty's ambassador. Similar orders were about the same time issued by the French government to their fleet, and they both anchored in Besika Bay about the middle of June. Soon after, a conference of the representatives of the four great powers was held at Vienna, and by the end of July a Note, originally drawn up by the French government, and sanctioned, with some modifications, by those of Britain and Austria, was finally adopted by the conference, and submitted for acceptance to Russia and Turkey. It was immediately acceded to by the former, but the latter declined doing so until some alterations were made in the wording of the Note, which might be misconstrued. At first the conduct of the Porte was disapproved by the four powers, but they afterwards admitted that the objections were well-founded. The czar, however, refused to receive the Note as altered, and would only accept of it in its original form. That the objections of the Porte were valid, was evinced by the fact, that the interpretation which in subsequent communications Russia insisted on putting upon it was just that which was not intended.

On the 5th of October the Porte issued a formal declaration of war, and on receiving intimation thereof, Omar Pasha, the Turkish general, who was then at Shumla, despatched a letter to Prince Gortschakoff, the Russian commander-in-chief in the Principalities, offering him fifteen days to evacuate that territory before commencing hostilities. To

Declaration of war.

¹ According to a census taken in 1844, the total population of European Turkey was 15,500,000, of which only 4,550,000 were Mussulmans, while 10,000,000 were members of the Greek Church, 640,000 Roman Catholics, and 70,000 Jews. In Asia Minor the proportions were of course very different. The total population there in that year subject to the Porte was 16,050,000, of whom 12,650,000 were Mussulmans, 3,000,000 Greek Church, and 260,000 Roman Catholics.

History. this the Russian general replied, that he "had no orders to commence hostilities, nor to conclude peace, nor to evacuate the Principalities." On the 14th of October the combined fleets of England and France, which had been for some time lying at Besika Bay, entered the Straits of the Dardanelles at the request of the sultan; and on the 1st of November the czar issued his manifesto of war.

In the beginning of November the Turks crossed the Danube at four places. The first passage was effected at Widdin, a place far up near the frontier of Servia, from which they pushed on to Kalafat, and occupied it with a force of 12,000 men. Lower down the river at Rustchuk a body of 2000 or 3000 men crossed, and entrenched themselves at Giurgevo. At Turtukai, still lower down, a large Turkish force crossed over to Oltenitza, where they established themselves, although they were vigorously attacked by the Russians. On the 2d and 3d of November the attacks of the Russians were repulsed with loss. On the 4th they mustered to the amount of 30,000 strong, and attacked the Turks, who numbered only about 18,000. A desperate engagement ensued, in which the Russians were defeated with a loss of about 1000 killed and twice that number wounded. Several spirited engagements subsequently took place at Kalafat and its neighbourhood, and notwithstanding all the efforts of the Russians, the Turks effectually made good their position there. Towards the end of November Omar Pasha, not deeming it prudent to expose his troops to attack during the winter, withdrew across the Danube, only retaining possession of the works at Kalafat, on the left bank of the river.

Destruction of Turkish fleet at Sinope.

An event now happened that filled Europe with horror, and gave a new character to the war. This was the unprovoked attack on, and the total destruction of, the Turkish fleet in the harbour of Sinope. On the 30th November the Turkish fleet, consisting of 7 frigates, 3 corvettes, and 2 smaller vessels, were lying at anchor in that harbour, when a Russian squadron, composed of 6 sail of the line, 3 of which were three-deckers, 2 sailing frigates, and 3 steamers, entered the bay, the frigates and steamers remaining outside the heavy ships. The action immediately commenced, and though the Turks fought with the courage of desperation, in the short space of two or three hours the whole of their vessels were burned or sunk, except one small steamer which got out and made for sea during the heat of the conflict. About 5000 of the Turks were killed, and only a very few escaped by swimming to land. The czar having, as we have seen, announced his determination to act only on the defensive, and to repel the advance of the Turks into the Principalities, this blow was totally unexpected on the part of the allies, whose representatives at Vienna were still exerting themselves to bring about a peace, and had just prepared a protocol, which the Ottoman Porte had agreed to receive as a basis of negotiation, when the news of this disaster reached them. The English and French fleets, too, instead of taking possession of the Black Sea for the protection of the Turks, were lying in the Bosphorus, while the Russians were actively using that sea for the conveyance of troops, arms, and ammunition to their various military posts. When the news reached St Petersburg the czar ordered a solemn "Te Deum" in the churches, and published an exulting manifesto. The English and French, who may be said to have hitherto acted only as spectators of the war, now saw that it was necessary to have recourse to more active measures. The combined fleet was immediately ordered into the Black Sea, and though negotiations were carried on for some time after, it could not be with any sanguine hope of a peaceful termination to the war.

1854.

On the 4th of February 1854 Baron Brunow, the Russian representative at St James's, formally announced the suspension of diplomatic relations between the two countries, and in a few days afterwards he closed his embassy, and

quitted London. On the 7th Lord Clarendon wrote to Sir G. Seymour at St Petersburg, directing him to withdraw from that capital with every member of the embassy; and about the same time similar instructions were forwarded by the French government to their *charge d'affaires* there, M. de Castelbajac. On the 12th of March a treaty or convention between England, France, and the Porte was signed, regulating the terms on which the two former were to assist the latter. Previous to this, however, on the 28th February, the first detachment of troops left for the East, and landed at Malta, where they remained till the 31st of March. On the 27th and 28th March the French and English respectively declared war. A portion of the French army sailed from Marseilles on the 19th of March, and on the 30th arrived at Gallipoli, a seaport of European Turkey, near the place where the Dardanelles expand into the Sea of Marmora; and on the 5th of April they were joined by the English detachment from Malta. Powerful works were constructed here, extending from the Gulf of Saro to the Sea of Marmora, so that, in case of necessity, the allied armies might have a safe place of retreat. Afterwards the allied forces were removed to the neighbourhood of Constantinople, the English occupying Scutari. Lord Raglan, who was appointed commander-in-chief of the English troops, arrived at Constantinople on the 29th of April, and Marshal St Arnaud, the French commander-in-chief, on the 8th of May.

The campaign on the Danube opened on 6th January Operations with a vigorous engagement between the Turks and Russians in the neighbourhood of Citate, a village where the Russians had established themselves. The Turks were victorious, and completely dislodged the enemy from the village. Attempts were made the next day, and for several succeeding days, with fresh troops, to re-take the place, but without success. A Russian report states that, in January 1854, 35,000 Russian soldiers had already perished in the Principalities. Besides those slain in battle, many had died from disease, want, and fatigue. For about a month after the battle of Citate both armies on the Danube were chiefly occupied in making preparations for fighting. About the 13th of February the Russians collected in considerable force against Giurgevo, and attacked it, so far successfully that the Turks, after an obstinate resistance of two or three days, evacuated the place, and retreated in perfect order across the Danube to Rustchuk. On the 23d of March the Russians, having been considerably re-inforced, crossed the Danube at three points, Ismael, Galatz, and Matchin, and entered the Dobrudscha with artillery and a siege-train, for the purpose of storming Silistia and attacking Omar Pasha at Shumla before the allied armies could come to his assistance. Silistia was invested on the 17th of May, and gallantly resisted for six weeks every effort of the enemy to take it. Among the besieged were two British officers, Captain Butler and Lieutenant Nasmyth, who greatly contributed to the success of the defence. The latter of these, in a letter to the *Times*, dated June 29, says,—“The Turkish army may well talk with pride. Their opponents had an army on the right bank of the Danube, which at one time amounted to 60,000 men. They had sixty guns in position, and threw upwards of 50,000 shot and shell, besides an incalculable quantity of small-arm ammunition. They constructed more than 3 miles of approaches and sprang six mines; yet during forty days not one inch of ground was gained, and they abandoned the siege, leaving the petty field-work against which their principal efforts had been directed a shapeless mass, from the effects of their mines and batteries, but still in possession of its original defenders.”

The bombardment of Odessa took place on the 22d of April, that town having fired upon an English flag of truce. The firing lasted for about ten hours, and did not cease till

History.

most of the batteries had been destroyed or silenced. The attack, however, was strictly confined to the forts, batteries, and military store-houses. On the 12th of May the *Tiger*, an English steam-frigate, ran aground near Odessa, and being attacked by artillery from the town, she surrendered after a short fight, her guns having been thrown overboard to lighten her. The crew were made prisoners and taken to Odessa, where they were well treated. About the same time a squadron dislodged the Russians from their stronghold of Redout Kaleh, on the coast of Circassia.

By the middle of May the French and English armies were in sufficient force and organization to take the field; and on the 19th of that month a council of war was held at Varna, at which Lord Raglan, Marshal St Arnaud, and Omar Pasha were present. It was then decided to bring up all the disposable forces to Varna; and accordingly, on the 29th of May the greater portion of the French and English troops disembarked at that place.

The raising of the siege of Silistria, and the retreat of the Russians, were the signal for the general advance of the Turkish army. They re-crossed the Danube in the beginning of July; and on the 8th of that month an action was fought at Giurgevo, very creditable to the Turkish arms. At night the Russians abandoned their camp, leaving an immense quantity of stores, and retreated to Bucharest. They soon afterwards quitted the latter city, and retired beyond the Sereth. Towards the end of August the Austrian troops took possession of the Principalities, in terms of a convention concluded between the Emperor of Austria and the Porte. During this time the fleet in the Black Sea was doing good service by destroying the Russian batteries at the Sulina mouth of the Danube.

Baltic
Fleet.

Meanwhile the allied fleets were cruising about in the Baltic. The English fleet, under the command of Sir Charles Napier, had left Spithead on the 11th of March. It at first comprised 8 screw line-of-battle ships, 4 screw frigates, and 4 paddle-steamers, and was subsequently augmented by others, till it amounted to 42 vessels, with 2200 guns, 16,000 horse-power, and 22,000 sailors and marines. About the middle of April a French squadron of 23 vessels carrying in all 1250 guns, sailed from Brest under the command of Vice-Admiral Parseval-Deschênes. A detachment of the English fleet under Admiral Plumridge, cruising in the Gulf of Bothnia during May and the early part of June, took and destroyed 46 merchant vessels, with from 40,000 to 50,000 barrels of pitch and tar, and an immense quantity of naval stores. The only proceeding that was attended by loss of life was an attempt upon Gamle Karleby, a small seaport-town of Finland. The vessels *Odin* and *Vulture* were despatched to that place to take possession of any vessels or naval stores that might be found there, but the water off the port was so shallow that they were obliged to anchor 5 miles from the town. Four boats were therefore manned, and sent in to destroy the stores. Hoisting a flag of truce, they first demanded the surrender of the place; and this having been refused, the flag was hauled down, and the *Odin's* cutter was proceeding to reconnoitre when it was fired upon from an ambuscade, and eleven of its men killed and wounded. The firing was kept up with vigour on both sides, and the *Vulture's* paddle-box boat became so unmanageable, and her crew were so much cut up, that she drifted on shore, and became the prize of the enemy, who made prisoners of all that remained alive. Our loss amounted to fifty-four officers and men, killed, wounded, and missing. In the month of May the *Hecla* and *Arrogant* proceeded by night from Hango roads up 7 miles of a narrow river to Eknaes, destroyed a powerful battery which opened fire upon them, put to flight a large troop of horse artillery and a large body of infantry, and cut out a large merchantman laden with a valuable cargo, returning in safety with the prize. A day or two after this the large

History.

fort of Gustavus Varn in Hango Roads was shelled, and great loss inflicted upon the Russians. About the end of June the allied fleet, amounting to 51 sail, proceeded to reconnoitre Cronstadt, anchoring about 8 miles from that fortress, and sending forward six steam-vessels to take soundings, and to make a closer inspection, with orders to keep out of cannon range. The two main divisions of the allied fleets subsequently proceeded to the Bay of Ledsund, to the south of the Aland Islands, in the Gulf of Bothnia. On the 15th of July 10,000 French troops were embarked at Boulogne on board of English vessels for the Baltic. These were disembarked in the morning of the 8th of August in the vicinity of Bomarund, a strong fortress on one of the Aland Islands. The chief fortress was a structure of granite about 40 feet in height, and mounting about 80 cannon. The land rose above this fort, and on the crests of the low hills were two granite towers, each surrounded by a broad ditch. There was also an earthen battery of 5 pieces of artillery. About 1200 marines of both nations were also landed on the north of the island, and commenced erecting a battery. On the 13th the French commenced the bombardment of the western tower, which was captured by them on the following morning. On the 15th two batteries, manned by English seamen and marines, began to play upon the eastern tower, and a complete breach having been made, and all the guns silenced, a white flag was hoisted in the evening, and the place surrendered. On the same day the bombardment of the principal fort commenced both on land and from the sea, five vessels firing shot and shell at the front of the battery from a long range. Next day the attack was renewed; but at noon a white flag was hoisted from the walls, and the garrison surrendered unconditionally. There were taken 112 mounted and 79 unmounted guns, 3 mortars and 7 field-pieces, and also 2235 prisoners. Our loss was 1 officer and 1 private killed, and 7 wounded; the French loss was somewhat greater. The fortifications were subsequently reduced to a mass of ruins. After this the allied fleets effected nothing of importance in the Baltic. The French fleet returned early in the autumn, and the English fleet returned by single vessels as the winter drew on, some remaining in the Baltic till the ice began to form, and reaching England late in November. Of the French land forces about 800 perished by cholera, besides those who had fallen in action.

The months of July and August were very calamitous Varna. for the allied armies at Varna and the neighbourhood, as well as for the fleet at Baltchik Bay. The mortality was fearful, and the men were reduced to great despondency; praying to be led against the enemy at whatever risk rather than to die the inglorious death that was so fast decimating their ranks. On the 26th of August a council of war was held at Varna by all the English and French generals; and on the 3d of September the final order for the embarkation of the British troops from Varna was issued. Their destination was the Crimea, and they were to disembark at some place not far from Sebastopol. The order of battle was formed before the landing. The troops were to enter the boats in the order in which they stood in the ranks. The boats were to form in line abreast, and to pull into the shore stoutly, steadily, and in perfect silence. On landing, they were to form in continuous columns. Three days' provisions were to be carried by each individual, both officers and men. The troops were thus ready to encounter the enemy had he met them on landing, and it is clear that such an encounter was expected. On the afternoon of the 18th of September the fleets anchored in Eupatoria Bay, and the town was summoned to surrender, which it at once did, being without the means of defence. They left early next morning, and, keeping near the shore, anchored about 12 miles below Eupatoria, where they com-

Battle of
the Alma.

menced to disembark, and before night they had landed without opposition 20,000 British troops, with 36 guns, and a large number of horses, and about an equal number of French. In the afternoon it rained, and a swell arose along the coast, which continued to increase. At night the rain came down in torrents, and the troops on the beach were drenched, being houseless and tentless. The swell next day impeded the landing of the guns and cavalry, and occasioned some loss in horses and boats; but during that and the following day the disembarkation was completed. As yet no enemy, except a few isolated bands of Kozzacks, had been seen; but the steamers sent to reconnoitre the coast reported that the Russians had formed a strong camp on the heights to the south of the River Alma. The troops commenced their march in the morning of the 19th, and halted for the night on the left bank of a small stream called the Bulganac. On that day there was a skirmish between our light cavalry and a party of Russian dragoons. At daybreak the following morning the Agamemnon, with the inshore squadrons, moved along the coast, and took up a position off the Alma. A column of French infantry, preceded by skirmishers, now descended from the heights about the Bulganac, and boldly advanced by the seaside. It was soon followed, more inland, by the main body of the French army. When within a mile of the Alma the French halted. They were then joined by the English, who formed into line with their allies. Both armies then moved forward, and again they halted. Before them, on the lofty cliffs and precipitous slopes on the other side of the Alma, were the enemy. Their position was well chosen, and seemed to defy attack. Running closely along the left bank of the Alma for about 2 miles from the sea, is a bold and almost precipitous range of heights of from 350 to 400 feet in height. It then makes a long sweep, forming a great amphitheatre about 2 miles in width at its mouth. Across this great opening, running parallel to the river, and at distances of from 600 to 800 yards from it, is a low ridge of heights varying from 60 to 150 feet. Across a part of the slope was a trench deep enough to protect the Russian marksmen, and to impede the progress of the assailants. On the right, and a little retired, was a powerful covered battery aimed with heavy guns, which flanked the whole of the right of the position; whilst artillery were stationed on almost every eminence commanding the open ground over which our troops must advance. On the slopes of these hills, which formed a sort of table-land, were placed dense masses of the enemy's infantry, whilst on the heights above was his great reserve; the whole amounting, it is supposed, to between 45,000 and 50,000 men. The banks of the river were extremely rugged, and for the most part steep, and the willows along it were cut down to prevent them from affording shelter to the attacking party. The attack was commenced by the French division of troops under General Bosquet, which was nearest the shore. He first detached a regiment of Zouaves and a body of sharpshooters, who crossed the river near its mouth without being perceived by the enemy. Presently they were seen "swarming like ants," with extraordinary agility, up the almost perpendicular face of the cliff, and they soon reached the summit. On reaching the plateau they immediately formed into line under a deadly fire of musketry and artillery. General Bosquet now brought up the remainder of his division; and at the same time the main body of the French army, under Prince Napoleon and General Canrobert, advanced through the village of Alma-tomak, and, fording the river, gained a pathway which led up to the plateau. It was only with the greatest difficulty that the French artillery could be dragged up these rough passes; but at length one battery gained the heights, and was rapidly carried to the assistance of the Zouaves. The Zouaves and the few troops that had joined them held their ground with admirable courage and

steadiness until other French corps came up. Some regiments of the line were foiled in an attempt to force the Russian position to the left of the Zouaves; but the most deadly contest took place near a tumulus on which stood an unfinished tower. Here the main body of the enemy was collected, and to dislodge them the Zouaves, with some regiments of the line, charged with the bayonet. The Russians made a most determined stand, but after sustaining repeated and impetuous charges, they fell back apparently in good order. Seeing his left about to be turned, Prince Menschikoff now sent a considerable mass of infantry and artillery to its support. Up to this time the English had remained inactive, the arrangement being, that they were to wait until the French should have gained the heights and have turned the Russian left. But Marshal St Arnaud, seeing that fresh columns of infantry and more batteries of heavy artillery were being brought up against him, sent to request Lord Raglan to advance without further delay. The command was accordingly given to advance, and as they approached the bank of the river the Russian batteries on the slopes opened up a deadly fire. At the same time sharpshooters behind walls or in the vineyards harassed our troops, but these were soon driven over the river by our rifles. The Russians had set fire to the village of Burluik, lying between our troops and the river, but as soon as the artillery got beyond the smoke they began to play upon the enemy, and inflicted considerable damage. Partly under cover of this fire, Lord Raglan, at the head of his staff, plunged into the ford, and, amidst a thick shower of shot and shell, gained the opposite bank, close to the left of our allies. In consequence of the burning of the village two regiments of Brigadier-General Adams's brigade, being part of Sir De Lacy Evans's division, had to pass the river at a deep and difficult ford to the right, under a sharp fire; while his first brigade, under Major-General Pennefather, and the remaining regiment of Brigadier Adams, crossed to the left of the conflagration, opposed by the enemy's artillery from the heights above. In the meantime, the light division, under Sir George Brown, which was to be the first to attack, effected the passage of the Alma in their immediate front. The banks of the river, from their rugged and broken nature, were serious obstacles to their advance; while the vineyards through which they had to pass, and the trees which had been felled, created additional impediments, and rendered every attempt to form under a galling fire almost an impossibility. Nevertheless, Sir George nobly persevered. The first brigade, under Major-General Codrington, composed of the 7th, 23d, and 33d regiments, rushed up the slope in teeth of the heavy guns placed in the earthwork, and with a courage that has never been surpassed, in spite of ball and grape-shot, drove the enemy before them even to the cannon's mouth. Some of our men even leaped into the redoubt, but these were soon driven out by the awful fire of the Russian infantry. "Sir George Brown," says an eyewitness (the *Times*' correspondent), "conspicuous on a grey horse, rode in front of his light division, urging them with voice and gesture. Gallant fellows! they were worthy of such a gallant chief. The 7th, diminished by one-half, fell back to re-form their columns, lost for the time; the 23d, with eight officers dead and four wounded, were still rushing to the front, aided by the 19th, 33d, 77th, and 88th. Down went Sir George in a cloud of dust in front of the battery. He was soon up, and shouted '23d, I'm all right: be sure I'll remember this day,' and led them on again; but in the shock produced by the fall of their chief the gallant regiment suffered terribly while paralysed for a moment. Meanwhile, the Guards on the right of the light division, and the brigade of Highlanders, were storming the heights on the left. Their line was almost as regular as though they were in Hyde Park. Suddenly a tornado of round and grape rushed through from

History.

the terrible battery, and a roar of musketry from behind, thinned their front ranks by dozens. It was evident that we were just able to contend against the Russians, favoured as they were by a great position. At this very time an immense mass of Russian infantry were seen moving down towards the battery. They halted. It was the crisis of the day. Sharp, angular, and solid, they looked as if they were cut out of the solid rock. It was beyond all doubt that, if our infantry, harassed and thinned as they were, got into the battery, they would have to encounter again a formidable fire, which they were but ill calculated to bear. Lord Raglan saw the difficulties of the situation. He asked if it would be possible to get a couple of guns to bear upon these masses. The reply was 'Yes;' and an artillery officer, whose name I do not know, brought up two guns to fire on the Russian squares. The first shot missed, but the next, and the next, and the next cut through the ranks so cleanly and so keenly, that a clear line could be seen for a moment through the square. After a few rounds the columns of the square became broken, wavered to and fro, broke, and fled over the brow of the hill, leaving behind them six or seven distinct lines of dead lying as close as possible to each other, marking the passage of the fatal messengers. This act relieved our infantry of a deadly incubus, and they continued their magnificent and fearful progress up the hill. The duke encouraged his men by voice and example, and proved himself worthy of his proud command and of the royal race from which he comes. 'Highlanders,' said Sir C. Campbell, ere they came to the charge, 'I am going to ask a favour of you; it is that you will act so as to justify me in asking permission of the Queen for you to wear a bonnet! Don't pull a trigger till you're within a yard of the Russians.' They charged, and well they obeyed their chieftain's wish: Sir Colin had his horse shot under him; but his men took the battery at a bound. The Russians rushed out, and left multitudes of dead behind them. The Guards had stormed the right of the battery ere the Highlanders got into the left, and it is said the Scots Fusilier Guards were the first to enter. The second and light division crowned the heights. The French now turned the guns on the hill against the flying masses, which the cavalry in vain tried to cover. A few faint struggles from the scattered infantry, a few rounds of cannon and musketry, and the enemy fled to the south-east leaving 3 generals, drums, 3 guns, 700 prisoners, and 4000 wounded behind them. The battle of the Alma was won. It was won with a loss of nearly 3000 killed and wounded on our side. The Russians' retreat was covered by their cavalry; but if we had had an adequate force we could have captured many guns and multitudes of prisoners." The total loss of the allies was 619 killed and 2860 wounded, of which the British counted 362 killed and 1640 wounded. The loss of the Russians is stated at somewhat less than 8000 men, besides nearly 900 prisoners. The allies had in the field about 50,000 men, but of this number some 20,000 were not engaged. The entire force of the Russians amounted to about 40,000 men.

For the next two days the allies were busy in burying the dead and taking care of the wounded, and on the 23d they commenced their march towards Sevastopol. Learning that the enemy occupied a formidable position on the left bank of the Belbek, and that this river could not readily be rendered a means of communication with the fleet, and calculating that the chief preparations for defence would be made on the north side of the town, the commanders altered their original intention of making their attack on that side; and after their first night's bivouac they made a flank movement, and striking across a woody country, through which they had to steer their way by the compass, they reached an open road leading from Baktchiserai to Balaklava. At a place called Mackenzie's Farm

our advanced guard encountered a part of the Russian army, which fled in consternation at the unexpected meeting. On the 26th we obtained possession of Balaklava without opposition. The harbour is commodious and secure, but the entrance is narrow and somewhat difficult of access. The next day the allied armies took up their positions in the valley to the north of Balaklava and on the bleak heights above Sevastopol. The allies now suffered a severe loss in the departure and death of Marshal St Armand. He had left France in bad health, and finding himself quite overcome by acute and severe illness, he resigned his command to General Canrobert, and died on the 29th, on his way down to Constantinople.

The position taken up by the English before Sevastopol Sevastopol was to the right of the French, at a distance of 6 miles from their ships; while the French, on the left, rested on Cape Chersonese, and were within 3 miles of their ships. The ground in front of the French being soft, permitted the usual process of sapping and trenching to be carried on quickly, while the ground in front of the English was hard and rocky, and moreover broken by so many chasms or ravines that regular approaches were almost impracticable. The attack both by sea and land was opened on the 17th of October. Seven large Russian ships had been sunk at the mouth of the harbour, so that our ships could only fire at long range, and so produced very little effect. During this time the Russians had been exerting every effort to strengthen their position. A round stone tower at their extreme left was rapidly surrounded by strong, thick earthworks, upon which none but our heaviest artillery could make an impression; while the tower itself, originally white, was painted of the colour of the earth, so as to be a less conspicuous object to our mark. This round tower was by a line of earthworks connected with a formidable redoubt on the right known as the "Redan." Between the Redan and the arsenal at the head of Dockyard Creek were the "Barrack" batteries, and to the west of the Creek, facing the French line, was the Flagstaff Battery, united by a wall and strong defences to the Quarantine Fort and the sea. The average distance of the English batteries from the Russian lines was about 1500 yards. The French works, from the causes already mentioned, were considerably nearer than the English, but they had not so many guns in position. The attack opened early in the morning of the 17th, but the result proved that the French batteries were not strong enough, neither were their magazines well placed. About two hours after the commencement of the bombardment a French powder magazine blew up, doing considerable damage; and at 1.30 p.m. a more destructive explosion took place in their lines, rendering it necessary for their artillery to suspend its fire during the rest of the day. Between 2 and 3 p.m. a terrific explosion took place in the Redan Battery, which it was thought would have rendered this work untenable; but the Russians, with unflinching bravery, continued at their guns, and kept up the fire until nightfall, when both sides ceased. The Round Tower, being of stone, was soon knocked to pieces by our heavy guns, and completely silenced, while the Redan, which was of earth, was not materially injured. The loss of the English was 41 killed and 266 wounded; of the French, 30 killed and 164 wounded; while the Russians acknowledge a loss of 500 in killed and wounded. The siege was proceeding steadily, when, early in the morning of the 25th, the Russians made an attack upon the position in front of Balaklava. A low range of heights that runs across the plain, at the bottom of which the town stands, was protected by four small redoubts hastily constructed. Three of these had guns in them; and on a higher hill in front of the village of Camera, in advance of our right flank, was established a work of somewhat more importance. These redoubts were garrisoned by Turkish troops.

History.

First bombardment.

Battle of Balaklava.

History.

The 93d Highlanders was the only British regiment in the plain, with the exception of a part of a battalion of detachments composed of weakly men, and a battery of artillery belonging to the third division; and on the heights behind our right were placed the marines. At daybreak in the morning of the 25th the enemy were seen in great force advancing up the valley of the Tchernaya. This was indeed a new army, under the command of General Liprandi, which had just arrived from the Danubian Principalities, Austria having taken upon herself the occupation of the Principalities, and thus set free both the Russian and Turkish armies. Redoubt No. 1 was carried after a feeble resistance by the Turks, and Nos. 2 and 3 were evacuated without an attempt at defence. When the news reached Balaklava, Sir Colin Campbell, who commanded there, sent the 93d Highlanders, under Lieutenant-Colonel Ainslie, to draw up in line in front of the road leading to the town. Lord Raglan also, as soon as he was apprised of this movement of the enemy, withdrew from before Sevastopol the 1st and 4th divisions, and brought them down into the plain. After the three redoubts had been carried, the Russian cavalry at once advanced, supported by artillery and dividing into two bodies, the smaller of which charged down the slope upon the 93d, whose vigorous and steady fire instantly carried death into their ranks and threw them back in disorder. The other and larger mass turned to the right to attack our heavy cavalry, advancing straight towards the camp of the Scots Greys and the Enniskillen Dragoons, whose united number did not amount to 400 men. Their first line was at least double the length of ours, and it was three times as deep; while behind them was a similar line equally strong and compact. Though the ground was very unfavourable, it presented no check to our men, who charged into the Russian column with the utmost fury. "As lightning flashes through a cloud, the Greys and Enniskillers pierced through the dark masses of the Russians. The shock was but for a moment. There was a clash of steel and a light play of sword-blades in the air, and then the Greys and the red coats disappear in the midst of the shaken and quivering columns. In another moment we see them emerging and dashing on with diminished numbers and in broken order against the second line, which is advancing against them as fast as it can to retrieve the fortune of the charge. It was a terrible moment. . . . With unabated fire the noble hearts dashed at their enemy. It was a fight of heroes. The first line of the Russians which had been smashed utterly by our charge, and had fled off at one flank and towards the centre, were coming back to swallow up our handful of men. By sheer steel and sheer courage Enniskillers and Scot were winning their desperate way right through the enemy's squadrons, and already grey horses and red coats had appeared right at the rear of the second mass, when, with irresistible force, like one bolt from a bow, the 1st royalists, the 4th dragoon guards, and the 5th dragoon guards rushed at the remnants of the first line of the enemy, and went through it as though it were made of pasteboard, and, dashing on the second body of Russians, as they were still disordered by the terrible assault of the Greys and their companions, put them to utter rout." (*Times*' correspondent.) As the enemy withdrew from the ground which they had momentarily occupied, and seemed to be removing the captured guns, the Earl of Lucan was desired to advance and try to prevent them from effecting their object. From some misconception of the instructions, the lieutenant-general considered that he was bound to attack at all hazards; and he accordingly ordered Major-General the Earl of Cardigan to move forward with the light brigade. By this time the Russians had re-formed their own ground, with artillery in front and upon their flanks. According to the graphic account of the *Times*' correspondent—"They advanced in

History.

two lines, quickening their pace as they closed towards the enemy. A more fearful spectacle was never witnessed than by those who, without the power of aid, beheld their heroic countrymen rush to the arms of death. At the distance of 1200 yards the whole line of the enemy belched forth from thirty iron mouths a flood of smoke and flame, through which hissed the deadly balls. Their flight was marked by instant gaps in our ranks, by dead men and horses, by steeds flying wounded or riderless across the plain. The first line is broken; it is joined by the second; they never halt or check their speed one instant; with diminished ranks thinned by those thirty guns which the Russians had laid with the most deadly accuracy, with a halo of flashing steel above their heads, and with a cheer which was many a noble fellow's death-cry, they flew into the smoke of the batteries, but ere they were lost from view the plain was strewn with their bodies and with the carcasses of horses. They were exposed to an oblique fire from the batteries on the hills on both sides, as well as to a direct fire of musketry. Through the clouds of smoke we could see their sabres flashing as they rode up to the guns, and dashed between them, cutting down the gunners as they stood. We saw them riding through the guns, as I have said; to our delight we saw them returning, after breaking through a column of Russian infantry, and scattering them like chaff, when the flank fire of the battery on the hill swept them down, scattered and broken as they were. Wounded men and dismounted troopers flying towards us told the sad tale: demi-gods could not have done what we had failed to do. At the very moment when they were about to retreat an enormous mass of lancers was hurled on their flank. Colonel Shewell of the 8th hussars saw the danger, and rode his few men straight at them, cutting his way through with fearful loss. The other regiments turned and engaged in a desperate encounter. With courage too great almost for credence, they were breaking their way through the columns which enveloped them, when there took place an act of atrocity without parallel in the modern warfare of civilized nations. The Russian gunners, when the storm of cavalry had passed, returned to their guns. They saw their own cavalry mingled with the troops who had just ridden over them, and to the eternal disgrace of the Russian name, the miscreants poured a murderous volley of grape and canister on the mass of struggling men and horses, mingling friend and foe in one common ruin. It was as much as our heavy cavalry brigade could do to cover the retreat of the miserable remnants of that band of heroes as they returned to the place they had so lately quitted in all the pride of life." The brigade numbered only 607 men, and of these only 198 returned. The enemy made no further movement in advance; and at the close of the day the brigade of Guards of the first division and the fourth division returned to their original encampment.

The next morning several columns of infantry, accompanied by artillery, were seen issuing out of Sevastopol, to the number of 6000 or 7000, it was thought, on their way to join Liprandi's corps. Turning to the right, however, they ascended the hills, and suddenly appeared on a crest which commanded the second division under Sir De Lacy Evans. These withstood the attack with great bravery, and having at length received assistance, succeeded in putting the enemy to flight with the loss of about 600 killed and wounded, and 80 prisoners. Our loss was only about 80 killed and wounded. During all this time the siege was steadily progressing, but large re-inforcements were joining the Russian camp to the north of Sevastopol, while supplies and other re-inforcements were poured into the town itself.

On the 5th of November the Russian army, augmented by re-inforcements from the north, and animated by the presence of the Grand Dukes Michael and Nicholas, attacked

Battle of Inkermann

History.

our position overlooking the ruins of Inkermann. Shortly before daylight strong columns of the Russians came upon the advanced pickets covering the right of the English position. These defended the ground foot by foot with the utmost gallantry, until the 2d division, with its field guns, was got into position. The morning was extremely dark and drizzly; but it soon became apparent that the enemy had advanced numerous batteries of large calibre to the high grounds to the left and front of the 2d division, while powerful columns of infantry attacked with great vigour the brigade of guards. Additional batteries of heavy artillery were also placed on the slopes whence they could best tell upon us, until the guns in the field actually amounted to 90 pieces, independently of the ships' guns and the guns of Sevastopol, which were also playing upon our men. Protected by a tremendous fire of shot, shell, and grape, the Russian columns advanced in great force, requiring every effort on our part to resist them. Two battalions of French infantry now joined our right, and contributed materially to our success. About the same time a determined assault was made on our extreme left, and for a moment the Russians possessed themselves of four of our guns, but these were speedily re-captured. In the opposite direction the brigade of Guards was engaged in a severe conflict. The enemy advanced in two heavy bodies under cover of a thick brushwood, and assaulted with great determination a small unarmed redoubt. The combat here was most arduous, and the brigade, after displaying the utmost bravery and gallantry, was obliged to retire. Again and again they advanced to the charge, and again and again were driven back. At length a body of French troops came to their assistance, and occupied the redoubt, while the Guards speedily reformed in rear of the right flank of the 2d division. Subsequently to this the battle continued with unabated vigour, and with no positive result, till towards the afternoon, when symptoms of giving way first became apparent; and shortly after, although the fire did not cease, the retreat became general. Thus for more than six hours 8000 English and 6000 French sustained a hand-to-hand fight against 50,000 Russians. "The battle of Inkermann," says the *Times* correspondent, "admits of no description. It was a series of dreadful deeds of daring, of sanguinary hand-to-hand fights, of despairing rallies, of desperate assaults,—in glens and valleys, in bushwood glades and remote dells, hidden from all human eyes, and from which the conquerors, Russian or British, issued only to engage fresh foes, till our old supremacy, so rudely assailed, was triumphantly asserted, and the battalions of the czar gave way before our steady courage and the chivalrous fire of France." The loss of the enemy is estimated at about 9000; our loss was 632 killed, 1878 wounded, and 63 missing, total 2573; and that of the French was 1726 in killed and wounded.

On the 14th of November a terrible hurricane occurred on the Black Sea, and did great damage both on sea and shore. The tempest commenced at Balaklava about seven o'clock in the morning, and in less than two hours eleven transports had been wrecked, and six more dismantled and rendered unfit for service. The steamship *Prince*, a magnificent vessel of 2700 tons, which had arrived only a few days before, and had a valuable cargo of stores and necessaries for the war, was driven on the rocks with such force that hardly a piece of her was left. Of a crew of 150 men only six were saved. The French vessels suffered equally with ours. The pecuniary loss of the English alone was estimated at about a million sterling, while that of the French could not have been less. The total loss of men was estimated at about 1000, besides about 400 or 500 more who were taken prisoners and carried into Sevastopol.

History.

On land the tents of our soldiers were torn up and blown about in all directions. Snow also fell in abundance; and before the tempest had ceased, which was not till the afternoon of the 16th, the inland hills and ridges were deeply covered by it. After Inkermann the Russians did not for a long time make any grand attack upon the allies. The latter also contented themselves with remaining on the defensive till the arrival of re-inforcements should enable them to take more active measures. They too were besieged as well as being besiegers, having on their flank a force far superior to their own, and in front an irregular fortress of great strength, and an arsenal with almost unlimited resources. Re-inforcements and supplies were also constantly pouring into the place, which, from our limited forces, it was impossible to check. The allies were now suffering severely from disease and the want of necessaries, which became more felt as the winter set in. These pressed less heavily on the French than on us, their medical and commissariat departments being much better managed than ours. Indeed, the shameful neglect, carelessness, and ignorance that were manifested in the commissariat department of our army are scarcely credible. Thousands of our brave countrymen fell victims to this deplorable state of things. Many of them had to lie on the cold, damp earth under the wide canopy of heaven, thus frequently contracting diseases which there were no medicines to cure or comforts to allay; what food they obtained (and they were frequently on short rations) had often to be consumed in an unprepared state; 1500 sick and wounded after the battle of Alma were sent to Scutari, many of whom had not had their wounds dressed, though five or six days had elapsed on the passage.¹ Not the least culpable part of the business was, that abundant supplies had been provided by the government, most of which were lying at Balaklava, but from a blind adherence to form could not be removed, or were stowed away where they could not be reached or could not be found. It is well known that articles sent out for the army in the Crimea were brought back in the same vessels, and articles intended for the sick at Scutari were carried to Balaklava. The road, too, between the camp and Balaklava soon became such a wilderness of mud as to be almost impassable. According to the Report of the committee of the House of Commons, "from the middle of November this army was, during a period of many weeks, reduced to a condition which it is melancholy to contemplate, but which was endured both by officers and men with a fortitude and heroism unsurpassed in the annals of war. They were exposed under single canvas to all the sufferings and inconveniences of cold, rain, mud, and snow, on high ground and in the depth of winter. They suffered from overwork, want of clothing, insufficient supplies for the healthy, and imperfect accommodation for the sick." When the news of this state of matters reached England it naturally excited the greatest indignation and sympathy. In the beginning of October the *Times* originated a subscription for the sick and wounded, and in less than a fortnight £15,000 were collected, which a special commissioner was sent out to administer. A few days later the "Patriotic Fund" was set on foot, and before the end of the year the subscriptions had reached half a million, and soon afterwards they amounted to about a million and a quarter. The Society for the Propagation of the Gospel in Foreign Parts also sent out to the hospitals and the camp, with the concurrence and partly at the expense of the government, twenty-four additional chaplains. About the same time Miss Florence Nightingale, a lady singularly adapted for the work, set out with thirty-seven nurses to attend the sick in the hospital.

¹ At the beginning of February 1855 the grand total of our army in the East was 44,948, of whom 5773 were in the camp hospital, and 12,344 in that of Scutari, making a total of 18,117 sick.

History.

During the last three months of the year 1854, 9000 English re-inforcements were landed in the Crimea, but these being chiefly raw recruits, many of them, by the hardships which they had to endure, were soon rendered unfit for duty. Meanwhile the Russians, under the direction of General Todleben, were incessantly employed in improving their position, by strengthening their old fortifications and by the addition of new works. They scarpd the ground in front of all their batteries; constructed a strong abattis in front of all their lines; threw up earthworks and mounted guns on every available point; and made sunken batteries before their redoubts, the Redan and Malakoff, as well as along the scarps of the slopes.

In the beginning of the year an insurrection broke out among the Greek subjects of the sultan, at the instigation of Russia, and aided and abetted by the Greek nation. A series of early successes emboldened the insurgents, and the movement was rapidly gaining ground. Ineffectual remonstrances with King Otho led to an open rupture between Turkey and Greece, and on the 28th of March the Greek ambassador quitted Constantinople. Turkish troops were now poured into the disaffected districts, and their arms were generally successful; but still the rebels held out, encouraged by the free Greeks, and confidently relying on the speedy advance of the Russians to their assistance. On the 18th May the allies declared the whole of Greece to be in a state of blockade, and about the same time a body of French and English troops were landed at the Piræus. These energetic measures speedily brought King Otho to submit to the terms imposed upon him, and to engage to maintain a strict neutrality towards Turkey. Many of the insurgents now submitted, and one or two successes over the remainder speedily put an end to the insurrection. Early in summer a small squadron, consisting of the *Miranda* and *Brisk*, screw steamers of 15 and 16 guns respectively, and the *Eurydice*, a sailing-vessel of 26 guns, were despatched to the White Sea to blockade Archangel. Leaving the *Eurydice* at the mouth of the Dwina, the bar at which they were unable to cross, to maintain the blockade, the other vessels attacked and destroyed several places in that quarter. Kola, the capital of Russian Lapland, they took and destroyed, as also the town of Novitska. They also landed and destroyed all the public buildings and government stores at Shayley Island. An attack on the town of Solovetskoi, however, was unsuccessful, and they retired after twelve hours' firing. The squadron thereafter returned to England.

In the Pacific a fleet of the allies suffered a severe check before the town of Petropaulowski. It consisted of 3 French and 3 English ships of war, carrying in all 194 guns; and was on the outlook for two Russian war frigates that had caused some alarm in these seas. This town is the principal seaport of Kamschatka, and was strongly fortified both by nature and art. The firing of the ships commenced on the 28th of August, and was kept up for some days, and a partial landing did some damage, but a subsequent attempt to storm the town was unsuccessful. Our loss was 30 men killed and 156 wounded, while the French loss was about as great. The English admiral Price fell by a pistol-shot from his own hand on the first day of the attack, and survived only a few hours.

The war in Asia was maintained by Turkish troops, but with them were a considerable number of European officers to aid and counsel them. Chief among these was M. Guyon, an English gentleman, who had been an officer in the Austrian service, but having married a Hungarian lady of noble birth and large fortune, he left the army, and subsequently took part in the Hungarian war of 1848-49, in which he greatly distinguished himself. On the termination of that struggle he was of those that took refuge in Turkey. He accepted the offer made by the Turkish government to enter that service, and was sent to Damascus

to organize and instruct the army. The ability and skill of Guyon, however, was almost entirely neutralized by the wrongheadedness and incompetency of the commander-in-chief, Zarif Pacha, who would rarely follow his counsel, while his refusal to embrace the Mohammedan faith incapacitated him from having any direct authority over the soldiery. In July a body of 8000 Turks, under Selim Pacha, were totally defeated at Bayazid by a detachment of General Bebutoff's army. When news of this reached the Turkish army, which was lying 40,000 strong in a position of considerable strength a few miles in advance of Kars, Guyon advised an immediate attack on the main body of Bebutoff's army before it could be joined by the other portion or receive further assistance. Instead of this, however, several days were allowed to elapse before the attack was made, and by that time the Russian army was increased from 12,000 to 20,000 men, and was prepared to receive them. The 6th of August was the day of attack, but before the battle was well begun many of the Turks were fleeing, and the others were speedily put to flight. The loss of the Turks was 1200 killed, 1800 wounded, and 2018 prisoners. Had the Russian general marched directly upon Kars it is believed that he would have taken it without striking a blow; as it was, the defeated Turks got time to recover from their consternation and to gather strength; so that, as will be subsequently noticed, they made a most heroic defence. On 20th August Schamyl appeared suddenly before Tiflis, and did considerable damage, carrying off a large booty and a number of prisoners. This compelled the Russian general Bebutoff to send a portion of his troops to defend that place.

In the beginning of 1855 the allies received an accession of strength in the King of Sardinia. On the 26th of January Victor Emmanuel II. acceded to the convention concluded between Great Britain and France, and agreed to furnish and keep up for the war a body of 15,000 men, consisting of infantry, cavalry, and artillery; France and England guaranteeing the integrity of his dominions during the period of the war. England also undertook to furnish gratuitously the means of transport to the Sardinian troops, and also to recommend to Parliament to advance in loan to the King of Sardinia £1,000,000 sterling, the interest to be at the rate of 4 per cent., of which 1 per cent. was to form a sinking-fund.

At daybreak on the 17th of February a strong body of the Russians made an attack upon Eupatoria, which was defended by Omer Pacha at the head of a Turkish body of troops, and a French detachment. After a cannonade of some duration, the Russians advanced to the assault. Three times they attempted to carry the town, but were as often beaten back, and were at length obliged to retire with considerable loss. Their great superiority in cavalry and artillery prevented the garrison from molesting them on their retreat. The Turks behaved admirably on this occasion, and made a most gallant defence.

On the afternoon of the 2d of March all Europe was startled by the intelligence that the Emperor of Russia was dead. He was attacked by influenza on the 14th of February, but persisted in going out as usual, and on the 22d held a review of a corps of infantry of the Guards. After this he became much worse, but continued working as usual in his cabinet. On the 1st of March, however, soon after hearing of the unsuccessful attack upon Eupatoria, he became slightly delirious, and expired about noon of the 2d. He was succeeded on the throne by his eldest son Alexander II.

On the 15th of March a conference of plenipotentiaries of the five states (England, France, Austria, Russia, and Turkey) was opened at Vienna, with the view of coming to some arrangement regarding the points in dispute, based upon certain preliminaries that had been previously communicated by the allies to the Russian government and

History.

History. accepted by it. These preliminaries consisted of four articles, the substance of which was as follows:—1st, To abolish the exclusive protectorate exercised by Russia over Moldavia, Wallachia, and Servia, and henceforward to place the privileges accorded by the sultan to these principalities under the collective guarantee of the five powers; 2d, To give all the development possible to the free navigation of the Danube, for which purpose it would be necessary to place it under the control of a syndicate authority, invested with powers necessary to destroy the obstructions existing at the mouth of that river; and it would also be desirable that the course of the Lower Danube, from the point where it becomes common to the two bordering states, should be withdrawn from territorial jurisdiction; 3d, To revise the treaty of July 13, 1841, with the object of connecting the existence of the Ottoman empire more completely with the European equilibrium, and to put an end to the preponderance of Russia in the Black Sea; 4th, Russia to renounce any official protectorate of the Christian subjects of the sultan, the allies affording their mutual co-operation in obtaining from the Ottoman government the confirmation and the observance of the religious privileges of the different Christian communities, without distinction of sect. The conference, after sitting for about six weeks, dissolved, having been unable to come to any satisfactory arrangement on the third point. Afterwards Count Buol-Schauenstein, the Austrian plenipotentiary, summoned the members to meet again on the 4th of June to consider a proposition which it was believed might lead to an amicable settlement of the point in dispute. This was, instead of a mere one-sided limitation of the power of Russia in the Black Sea, to have an equality of the naval forces which each of the two coast powers should keep up in the Black Sea, and which should not exceed the actual number of Russian ships in that sea. This arrangement was to be entered into by the two powers between themselves, but was, nevertheless, to form an integral part of the general treaty. The French and English plenipotentiaries, M. Drouyn de Lhuys and Lord John Russell, had both left Vienna, but they had expressed themselves favourable to this arrangement. The proposal, however, did not meet with the favourable consideration of their governments, which saw no likelihood of a satisfactory peace being arrived at in that way. M. Drouyn de Lhuys accordingly resigned or was deprived of his office; and the conduct of Lord John Russell having given rise to a vote of censure being moved, that minister resigned his seat in the cabinet on the 16th of July.

During this time the war continued to be actively prosecuted. In front of the Malakoff, and between it and the trenches of the allies, was a slight elevation, the possession of which was of great importance to either party. This the besieged succeeded in taking possession of on the night of the 9th of March unknown to the allies, who were next morning disagreeably surprised to see it occupied by works which were hourly gaining strength. This was afterwards known to the allies as the Mamelon. On the second night after its occupation a vigorous attempt was made by the French to dislodge the enemy but without success. The Russians lost no time in sinking a number of pits before and on each side of their new acquisition, to serve as cover for riflemen, who became a source of great annoyance to the French. On the night of the 17th March the French made another attempt to possess the Mamelon. They succeeded in carrying the first and part of the second line of pits, but the heavy fire of the Russian musketry forced them to retire. On the night of the 22d March,—a dark and windy night,—a large body of the Russians issued silently from the Mamelon, and reached the advanced parallel of the French unobserved. After a short but severe struggle, the French were obliged to fall back upon their

reserves. The Russians then marched rapidly along the parallel to attack the English trenches. Here they were met by detachments of the 97th and 77th regiments, which gallantly stood their ground, and drove back the Russians at the point of the bayonet. At the same time, the French, having rallied, fell upon them, and pursued them so far that they were enabled to level and destroy a number of the rifle-pits along their front. It was on this occasion that Captain Hedley Vicars, who led on the 97th, lost his life. Our loss amounted to 182 killed and 373 wounded, besides 56 missing.

Early in April the railway between the camp and Balaklava was completed, and was of immense service to our army; and a month later London was in telegraphic communication with the seat of war. At daybreak on the **Second** morning of the 9th of April the second bombardment of Sevastopol commenced, and was continued for several days, **bombardment.** but without any decisive result. In the beginning of May the Sardinian troops began to arrive at Balaklava, and considerably strengthened the hands of the allies. About the middle of this month a change took place in the commandership of the French army, and General Canrobert was succeeded by General Pelissier, an officer who had greatly distinguished himself in the Algerine wars. General Canrobert, with true soldier spirit, requested to be still permitted to take part in the war, and obtained the command of a division. On the night of the 2d of May the French had taken by storm the Russian counter-approaches in front of the central bastion, and the enemy then, to impede their progress and take their attacks in flank, began to construct new lines of counter-approach on the Quarantine side, connecting by a gabionnade their ambuscades at the extremity of the bay with those at the cemetery, and forming a continuous covered way between this work and the right lunette of the central bastion. This would have enabled them to make powerful sorties by assembling large bodies of men behind these defences. The French general therefore determined to carry these works; and accordingly an assault was arranged to take place on the night of the 22d of May. Two simultaneous attacks were organized,—one on the ambuscades at the bottom of the bay, the other on the ambuscades of the cemetery, by the south-east angle of that inclosure. The Russians seemed quite prepared for the attack, and were awaiting it in great force. It is thus described by the correspondent of the *Morning Chronicle*:—"From every point of the Russian batteries commanding the trench a fire of artillery was poured upon them with such density and effect that whole companies were swept away before it. Still they held their ground, though under the fire of the batteries they fell by scores. Strong parties of the enemy occupied the covering trenches, and from their position were enabled to enfilade the advanced trench with a murderous fire of infantry. It was a mere slaughter of the French. Twice driven to desperation by the cross fire from the trenches, they sallied out and attempted to carry them at the point of the bayonet; but these mere ebullitions of valour were of no avail against the strong works and well-organized resistance of the enemy. In both cases the French were driven back with loss, and retired to the cross-trench, where they still continued to melt away under the devastating fire of artillery and musketry. It was close on dawn when a message was sent to the French general informing him that nearly half the column had fallen in the attempt to hold the place; that it was a mere useless waste of life, as by daylight it would be utterly untenable. The answer was returned that they were to gather their dead and wounded, and retire. This they accordingly did at about four in the morning, after having maintained the sanguinary and unequal contest for more than six hours." Next night "the plan was better arranged under the immediate care of General Pelissier

History.

History.

himself, who informed the troops that if they failed then they must attack again at daybreak, and continue to attack until the trench was in their possession. Three columns—each 3000 strong—were chosen for the assault, and started just as dusk was commencing,—two slightly in advance, for the capture of the covering trenches on each side and the centre column for the trench itself. In spite of all the vigilance of the enemy, the right and left columns closed with the covering trenches before they were discovered, and instantly attacked them. For a moment the Russians seemed bent on an obstinate resistance, but the attack at such an early hour of the evening (a little after eight) evidently took them by surprise, and after a short struggle, both trenches were captured, the enemy flying in all directions.”

On the 22d of May an expedition, comprising 3800 English, under Sir George Brown, 7500 French, under General d'Autemane, and about 5000 Turks, was despatched for Kertch and the Straits of Yenikale, whence large supplies were constantly pouring into Sevastopol. As soon as they made their appearance before Kertch the enemy fled, blowing up their fortifications and destroying immense stores of provisions. Anapa was also abandoned; and large stores of provisions were destroyed at Genitchi, Berdiansk, Arabat, and Taganrog on the Don. It is calculated that the stores destroyed at Kertch and in the Sea of Azoff amounted to nearly four months rations for 100,000 men, the loss of which must have caused serious embarrassment to the Russian army in the Crimea. The object of the expedition being thus fully accomplished, the troops were re-embarked about the 12th of June, with the exception of those left in garrison at Yenikale and Pavlovskaja, the latter commanding the entrance to the strait at a point where it is narrowed by a sandbank to about $1\frac{1}{2}$ miles across.

Third bombardment.

Attacks on the Mamelon and Quarries;

The third bombardment of Sevastopol commenced in the afternoon of the 6th June, and next evening simultaneous attacks were made by the French upon the Mamelon and White Works (*Ouvrages Blancs*), and by the English on the Quarries. These were in each case successful. The French had to traverse a considerable extent of open space, exposed to a terrible fire of artillery and musketry, but this did not for a moment check the impetuosity of their attack. Within the redoubts a determined struggle took place, and continued for an hour before the Russians were driven out of the works. The French pursued them as far as the Malakoff, and even made an attempt to storm that work, but this not having been previously calculated upon, their force was insufficient for that purpose, and they had to retire under a terrific fire from the enemy. In this affair they took 62 guns and 400 prisoners, of whom 14 were officers. The English were equally successful in their attack upon the Quarries, which they carried in the most determined and gallant manner, and kept their ground in spite of repeated attacks by the Russians to dispossess them. The possession of these works materially strengthened the position of the allies; and it was resolved to follow up the success by an attack on the Malakoff and Redan. Accordingly, during the whole of the 17th a vigorous fire was kept up by the allies upon the town, and it was arranged to make the assault after a two hours' fire the following morning. At the suggestion of Pelissier, however, this part of the arrangement was departed from, and the attack was to commence at three o'clock in the morning at a signal from the French general. Unfortunately, General Mayran, who had the command of one of the divisions of the French army, mistook a blazing fuse for the rocket-signal that had been agreed upon as the notice for a general advance, and immediately gave the order for attack. They were immediately assailed by an overwhelming shower of ball and grape, not only from the works, but also from the enemy's steamers in the harbour. Advance was

on the Malakoff and Redan.

impossible but not one step did they retreat; while the other divisions rushed forward to support this premature movement. They reached and scaled with impetuous gallantry the entrenchment which connected the Karabelnaia ravine with the Malakoff, and succeeded in penetrating the *enceinte* itself. But in the meantime the English attack on the Redan had failed, and the French, deprived of their simultaneous support, and exposed to a crushing fire of artillery from the Redan and other works, were compelled to give way. The retreat commenced about half-past eight o'clock, and was carried out with order and coolness, without any attempt at pursuit on the part of the enemy. In their attack upon the Redan, the English, as soon as they showed themselves beyond the trenches, were assailed by a most murderous fire of grape and musketry. “Those in advance,” says Lord Raglan in his despatch, “were either killed or wounded, and the remainder found it impossible to proceed. I never before witnessed such a continued and heavy fire of grape, combined with musketry, from the enemy's works, which appeared to be fully manned.” Another part of the English attack, however, was crowned with success, though fruitless. General Eyre was despatched, at the head of a body of 2000 men, for the purpose of making a demonstration at the head of Dockyard Creek, and withdrawing the attention of the enemy from the real object of assault. He found the enemy strongly posted between a cemetery on their left and a mound or hillock on their right, and protected by stone walls in front. This position, however, was gallantly carried under a heavy fire. Our troops held their ground until the evening, and then retired unmolested. Our loss amounted to 165 killed, 1126 wounded, and 152 missing; and the French to 1598 killed or missing, and 1740 wounded. The Russians, according to their own account, lost during the two days 787 killed, and 4029 wounded. While the assault was going on several of the vessels of the allies opened fire upon the town and its sea defences, but with little effect. The English army now sustained a severe loss in the death of its commander, Lord Raglan, in the sixty-seventh year of his age. His strength and energies had been taxed to the utmost during the whole of the Crimean war, and the failure of the attack on the 18th is believed to have preyed upon his spirit, vexed as it no doubt must have been by the previous unfavourable comments upon his conduct at home. He had been unwell for some days, but before the evening of the 28th no danger was apprehended by his medical attendants. Alarming symptoms, however, then showed themselves; he became unconscious, and sank rapidly until he expired, in the course of a few hours. He was succeeded in the command by General Simpson. On the 16th of August the Russians made another desperate effort to raise the siege. This was by the covering army under the command of General Liprandi, which had remained inactive since the battle of Inkermann, but had recently been largely augmented by re-inforcements. For some days rumours of a premeditated attack on the part of the Russians had been current, and at daybreak on the morning of the 16th they advanced against our lines on the Tchernaya, where the French and Sardinians were posted, to whom belongs the entire glory of the victory, though they received some assistance from an English battery. A paper found in the pocket of one of the Russian generals, Read, who was killed, showed the nature and magnitude of the attack. “Had they succeeded,” says General Simpson in his despatch, “Balaklava was to have been attacked by one portion of their army, while the heights on which we now are were to have been stormed by the other; at the same time, a vigorous sortie was to have been made from the town on the French works on our extreme left, from the Quarantine, and another on the works on our extreme right on Mount Sapoune. The action is most glorious to the arms

History.

Battle of the Tchernaya.

History. of the French and Sardinian troops. To meet the force of the Russians the former had but 12,000 infantry and 4 batteries of artillery engaged; the latter had 10,000 men in position, 4500 actually engaged, and 24 pieces of cannon. The Russian force consisted of from 50,000 to 60,000 men, with 160 pieces of artillery, and cavalry to the amount of 6000. This disparity of numbers will readily explain the difficulty that would have been experienced had an attempt been made to follow up the advantage by a pursuit. The Russian retreat, moreover, was protected by the fire from the heavy guns in position on the Mackenzie heights. The loss sustained by the Russians is estimated at between 5000 and 6000 men, including 600 prisoners; while on the part of the allies it does not amount to more than 1000 men."

Attack on
the Mala-
koff;

The French lines of approach had now been advanced so near the Malakoff, and the loss of life was daily increasing to such an extent, as to render it necessary either to take the work or retire to a greater distance. Accordingly on the 5th of September a terrific cannonade was opened and kept up till noon of the 8th, the time of the attack. "This infernal fire," says Prince Gortschakoff, "principally directed against the embrasures, proved that the enemy was endeavouring to dismount our guns, to demolish our ramparts, and to prepare for taking the city by storm. It was no longer possible to repair the damage done to our works, and our efforts were limited to covering the powder magazines and the blindages with earth. The parapets crumbled down and filled up the ravines; it was necessary to continue clearing the embrasures, and the number of artillerymen killed was so great that it was with difficulty we could bring up others to take their place. Our loss at this period of the siege was extraordinary; from the 5th to the 8th of September there were placed *hors de combat* superior officers 4, subalterns 47, and 3917 soldiers, without reckoning the artillerymen who perished at their guns." At noon precisely the French rushed upon the Malakoff, and by this time almost all the Russian guns that bore upon the attack had been silenced. They crossed the ditches with surprising agility, and climbing on the parapets attacked the enemy to the cry of "Vive l'Empereur." At the fort of Malakoff, the slopes on the inside being very high, they stopped for a moment in order to form, and then mounted on the parapet and leaped into the work. The contest, which had commenced by musket-shots, was continued with the bayonet, with the butt-ends, and stones; and in a quarter of an hour the French flag was floating on the conquered redoubt. This was the signal for our troops to attack the Redan. The assaulting column consisted of only 1000 men, preceded by a covering party of 200, and a ladder party of 320 men. They had 220 yards of ground to cross under a very heavy fire of grape, and this space was soon covered with slain. Nevertheless, this did not impede their progress; and as they came nearer the salient the enemy's fire became less fatal. They crossed the abatis without difficulty, and made straight for the salient and projecting angle of the Redan. The ditch here was about 15 feet deep, but the men, led by their officers, leaped into it, and scrambled up the other side, whence they scaled the parapet almost without opposition. The few Russians who were in front ran back and got behind their traverses and breastworks, and opened fire upon them. On reaching the parapet, our men unfortunately began loading and file-firing, instead of following their officers and attacking the breastworks. The Russians now flocked to the traverses, whence they kept up a heavy fire on the men getting over the parapet or through the embrasures; and thus so many were killed and wounded that no sufficient force was left of the first arrivals to make a rush across the open space which lay between the salient and the traverses. For nearly two hours did our troops maintain this unequal contest before they abandoned the

on the Re-
dan.

Redan and gave up the attempt. French attacks had also been directed against the Little Redan on the right and the central bastion on the left, but these were also unsuccessful. In both cases our allies succeeded in penetrating within the works, but they found themselves exposed to such a murderous fire from all sides that they were obliged to give way. The struggle for the possession of the Malakoff was long and deadly, and again and again did the Russians attempt to retake it during the day, but without success. Our loss on that day amounted to 385 killed, 1886 wounded, and 176 missing; the French loss to 1489 killed, 4259 wounded, and 1400 missing. The Russians, according to their own account, lost 2684 killed, 7243 wounded, and 1763 missing. The possession of the Malakoff rendered the south side of the town quite untenable; so that the enemy, finding every effort to retake it unavailing, began in the evening to evacuate the town. During the night they exploded their magazines, blew up their fortifications, and set fire to the town. The ships, frigates, and other sailing-vessels were all sunk, with the exception of the steamers. Next morning the allies found the town deserted and in ruins. The walls of the houses attested the force and effect of the terrible bombardment, hardly a building remaining intact from shot or shell. The number of cannon and the quantity of the materials of war obtained was immense. The French took possession of the eastern and the English of the western part of the town.

On the 29th September a body of French cavalry put to flight a strong body of Russian horse at Koughell, 5 leagues N.E. of Eupatoria. The Russians lost about 50 killed and 169 prisoners, besides 6 pieces of cannon; whereas the loss of the French was only 6 killed and 28 wounded.

On the 17th of October Kinburn surrendered to the allied fleet, after a short bombardment. This fortress is situated on a low promontory at the entrance of a gulf into which flow the Boug and the Dnieper. On the opposite side of the gulf, and about 2½ miles distant, is Oczakoff, which the Russians blew up and evacuated on our getting possession of Kinburn. The possession of these forts was of the utmost importance to the allies, as they thus commanded the sea-approach to Kherson on the Dnieper, and Nicolaieff, the naval arsenal of the Black Sea, on the Boug. The English troops soon after embarked for the Crimea, leaving a French force to garrison the forts. Soon after, a detachment of vessels from the allied fleet lying at Kertch took and destroyed the Russian establishments at Taman and Fanagoria.

On the 10th of November General Simpson resigned the command of the English army, and was succeeded by General Sir William Codrington. On the 15th of the same month a terrible explosion of 100,000 lb. of powder took place in the French siege-train, destroying an immense quantity of stores, and killing 21 and wounding 116 of the English and a still greater number of the French. On the 12th of this month the Emperor of Russia reviewed his troops in the Crimea; and soon after an imperial *ukase* was published, announcing a new Russian loan of 50 millions of silver roubles.

This year the allied fleet in the Baltic was as barren of great results as last year. Rear-Admiral Dundas Baltic fleet. commanded the English fleet, and Rear-Admiral Penard had the command of the French. Eleven sail of the line and five paddle-steamers left the Downs on the 9th of April, and arrived at Kiel on the 19th. They were gradually re-inforced by others; and in the month of July there were in the Baltic 85 English vessels of war, mounting 2098 guns, and 16 French vessels of war, with 408 guns. In the combined fleet there were 23 line-of-battle ships, with 1853 guns; 31 frigates and corvettes, with 554 guns; 29 smaller steamers and gunboats, with 78 guns; and 18 mortar-boats and other craft, with 21 guns. The utmost

History.

History. indignation was excited in England by the news of a boat, landing some prisoners under a flag of truce, having been attacked, and its crew either killed or taken prisoners. The facts were these:—On the 5th of June H.M.S. *Cossack*, when off Hango Point, despatched a cutter with a flag of truce to land some prisoners taken on board of some merchant vessels. After landing the prisoners, the officer in command, with several of the boat's crew, proceeded to communicate with the officer of the station, carrying the flag of truce along with them. They had not proceeded more than 50 yards from the boat when they were suddenly fired upon by Russian soldiers in ambush, and at the same time those in the boat were also attacked. Of the crew of eleven, six were killed and four badly wounded. The survivors were carried to Eckness (except one of the wounded, who made his escape in the boat), where they were treated with great kindness; but no satisfaction was obtained for this inhuman outrage.

The allied fleet, consisting of forty vessels, lay for more than three weeks off the north side of Cronstadt without attempting any hostile movement, and afterwards Admiral Baynes was left in command of a strong squadron there. One division of this squadron advanced along the north side of the island of Cronstadt, until it cast anchor within 5 miles of the town and shipping, and in view of the spires of St Petersburg. This part of the channel was found to be thickly studded with "infernal machines," which were taken up in large numbers by the boats. The only operation of importance effected this year by the allied fleet in the Baltic was the destruction of Sweaborg, which protects the great naval station of Helsingfors. The allied fleet arrived off Sweaborg on the 6th of August, and the two following days were spent in making preparations for the attack. The French had established a siege battery of four mortars on the small island of Abraham, within 2500 yards of the forts. They opened fire on the morning of the 9th, and in less than three hours the shells were observed to cause considerable damage in the fortress. Numerous fires broke out on several points at the same time, and the flames were soon seen to rise above the dome of the church situated in the northern part of the island of Est-Swaro. A monster explosion soon after took place, and was followed by three others in the course of half-an-hour. The bombardment was kept up till the morning of the 11th, and during that time Sweaborg presented the appearance of a vast fiery furnace. Storehouses, magazines, barracks, government establishments, and a great quantity of military stores were all destroyed. The loss on the side of the allies was confined to one English sailor killed and a few slightly wounded. Nothing further of any moment was attempted by the allied fleet; and on the approach of winter the main body returned home, leaving a flying squadron to continue the blockade until the ice rendered the sea impassable by vessels.

War in Asia.

We now turn to the seat of war in Asia. We left the Turkish army at Kars in the end of last year, and it was not till the 16th of June that the Russians made their first attack on that town. The Russian army was now nearly 40,000 strong, including 10,000 cavalry, and was under the command of General Mouravieff. The cavalry drove in the Bashi-Bazooks, who were posted in the plain to the south-east of the city, but were checked and thrown into disorder by a well-directed fire from the batteries of the Koradagh and Hafiz Pasha. They subsequently brought up their artillery and cannonaded the earthworks of those defences for some time without effect, and then retired. They, however, invested the fortress and works so as to cut off all supplies.

In the end of July Lieutenant-Colonel Williams was sent out by the English government to act as her Majesty's commissioner at the head-quarters of the Turkish

army in Asia, and reached Kars about the middle of September. No attempt was made by the Russians to carry the place by assault until the morning of the 29th of September. At daybreak on that day they advanced in three columns, supported by twenty-four guns, and attacked three different parts of the defences. The garrison received them, as soon as they came within range, by a crushing fire of artillery from all sides, but the Russians rushed up the hill against the redoubts and breastworks in the face of a deadly fire of musketry. After a long and desperate struggle, the left division was completely broken, and fled in disorder down the hill, leaving 850 men dead on the field, besides those carried off by their companions. The central column attacked the redoubts of Tahmasb and Yulseh, and here a sanguinary contest was maintained for several hours, the enemy being repulsed in all his attempts to enter the closed redoubts, which mutually flanked each other with their artillery and musketry, and made terrible havoc among the enemy. After a severe struggle, the right column turned the left flank of the entrenched wing of the Tahmasb defences, and penetrated to the rear of the Turkish position. They were here met by several bodies of re-inforcements which immediately fired upon them, and then charged them with the bayonet. At the same moment the Turkish troops made a sortie from the Tahmasb redoubts and attacked the wavering column of the Russians, which broke and fled down the heights, under a murderous fire of artillery. Meanwhile the Russians had captured, by overwhelming numbers, that portion of the defences called the English *tabias* or redoubts; but battalions of infantry were sent up, which gallantly attacked and drove them out at the point of the bayonet. The Russians now hastily retreated along the whole line, and suffered severely from the batteries, which kept up an incessant fire upon their crowded columns. General Williams, in his account of the battle says,—“During this combat, which lasted nearly seven hours, the Turkish infantry, as well as artillery, fought with the most determined courage; and when it is recollected that they had worked on their entrenchments, and guarded them by night throughout a period extending to nearly four months, I think your lordship will admit that they have proved themselves worthy of the admiration of Europe, and established an undoubted claim to be placed among the most distinguished of its troops. With regard to the enemy, as long as there was a chance of success, he persevered with undaunted courage, and the Russian officers displayed the greatest gallantry. Their loss was immense; they left on the field more than 5000 dead, which it took the Turkish infantry four days to bury. Their wounded and prisoners in our possession amount to 160, while those who were carried off are said to be upwards of 7000.” The Turkish army lost 362 dead and 631 wounded, and the towns-people, who also fought with bravery, lost 101 men.

History.
Attack on Kars.

Notwithstanding this bloody repulse the Russians continued their blockade of the town, and at length the garrison was reduced to the greatest distress. After the most due sufferings, and seeing no appearance of relief, they at length agreed to surrender. The conditions agreed to were highly honourable to the besieged, and the whole conduct of General Mouravieff was honourable and courteous towards his unfortunate foes.

Before the close of the year 1855 Russia had given indications that she was desirous for peace; and Austria, doubtless feeling that she could not much longer remain, as she had hitherto done, an almost passive spectator of the war, strained every nerve to bring the opposing powers to terms. Accordingly, in the month of December Count Esterhazy was sent by the court of Vienna to St Petersburg with certain proposals for peace which would be consented to by the allies. These proposals were acceded to

Peace.

History. by Russia, and a meeting of representatives took place at Vienna on the 1st of February. It was then agreed that plenipotentiaries from each of the six states should assemble at Paris on the 26th of February. Prussia was also invited to send representatives to the conference. The conference opened on that day, and their first business was to declare an armistice, which was to cease, if not renewed, on the 31st of March next. The conference lasted until the 30th of March, on which day the treaty of peace was definitely signed, but the ratifications were not exchanged until the 27th of April following. The substance of the treaty of peace was:—That the territories conquered or occupied by the respective belligerent powers be evacuated and restored; that prisoners of war be immediately delivered up on either side, and full and entire amnesty granted to those subjects of either party that may have been compromised by connection with the enemy. Each and all of the other states engage to respect and maintain the independence and territorial integrity of the Ottoman empire, and declare the Sublime Porte admitted to participate in the advantages of the public law and system of Europe. In the event of a misunderstanding between the Sublime Porte and one or more of the other contracting powers, each engages to submit the cause of quarrel to the others before having recourse to arms. The sultan records his generous intentions towards the Christian population of his empire; and intimates his having issued a firman with the view to ameliorate the condition of his subjects, without respect to sect or race,—it being, however, clearly understood that none of the other powers shall have right to interfere in the relations of his majesty with his subjects, nor in the internal administration of his empire. The convention of 1841, which maintained the right of the sultan to close the Straits of the Dardanelles and the Bosphorus to all foreign ships of war is confirmed, reserving always to the sultan the right to grant firmans of passage for light vessels under flag of war employed in the service of the missions of foreign powers; or stationed, according to treaty, at the mouths of the Danube (in number not exceeding two for each power) to secure the execution of the regulations relative to the liberty of that river. The waters and ports of the Black Sea are thrown open to the mercantile marine of every nation, the two bordering powers engaging not to establish or maintain any military-maritime arsenal upon the coast. These two powers further mutually engage each not to have in that sea more ships of war than six steam-vessels of 50 metres (164 feet) in length at the line of floatation, of a tonnage of 800 tons at the maximum, and four light steam or sailing vessels of a tonnage which shall not exceed 200 tons each. The navigation of the Danube shall be free to the flags of all nations, in accordance with the principles established by the act of the congress of Vienna to regulate the navigation of rivers which separate or traverse different states; and to carry out these views a commission shall be named composed of a delegate for each of the seven contracting states, who shall also cause to be executed the works necessary to clear the mouths of the Danube, and put and maintain them in the best possible state for navigation; to cover the expenses of which fixed duties of a suitable rate shall be levied, but no duty or charge shall be leviable founded solely upon the fact of the navigation of the river. A permanent commission, composed of a delegate for each of Austria, Bavaria, Turkey, and Wurtemberg, and commissioners from the three Danubian principalities, subject to the approval of the Porte, shall prepare regulations of navigation and river police, remove all impediments to the navigation of the river, and on the termination of the European commission (within two years) shall assume their powers, and duties. To insure the due execution of these regulations each of the contracting powers shall have right to station at all

times two light vessels at the mouths of the Danube. In order the more fully to secure the free navigation of the Danube, and in consideration of the possessions restored to him, the Emperor of Russia consents to the rectification of his frontier in Bessarabia; the new frontier-line to be from the Black Sea, 1 kilometre east of the Lake Borna Sola, northward to the Akerman road, then along that road and the Wall of Trajan, passing south of Bolgrad to the River Yalpuck, extending along that river to the height of Saratska, and terminating at Katamori on the Pruth, above which the old frontier should undergo no modification; the territory thus ceded to be annexed to the principality of Moldavia, under the suzerainty of the Sublime Porte. The principalities of Wallachia and Moldavia to continue under the suzerainty of the Porte, which engages to preserve to them an independent and national administration, as well as full liberty of worship, legislation, commerce, and navigation. The laws and statutes at present in force to be revised by a special commission, to meet at Bucharest without delay; and the sultan to convoke immediately in each of the two provinces a divan *ad hoc*, representing most closely all classes of society, to express the wishes of the people in regard to the organization of the Principalities. The report of the commission having regard to the opinions expressed by the two divans, shall be submitted to a convention to meet at Paris, and in conformity with the stipulations of that convention, a hatti-sherif shall constitute definitively the organization of those provinces. No exclusive protection shall, however, be exercised over them by any of the other contracting powers, nor shall there be any separate right of interference in their international affairs. If the internal tranquillity of the Principalities shall be menaced or compromised, the Sublime Porte shall come to an understanding with the other contracting powers regarding the steps to be taken to restore peace, and no armed intervention shall take place without their sanction. The principality of Servia to continue to hold of the Sublime Porte, in conformity with the imperial hattis, which fix and determine its rights and immunities, under the collective guarantee of the contracting powers. A commission, consisting of two Russian, two Turkish, one French, and one English commissioners, to be appointed to settle the boundary between Russia and Turkey in Asia, as before the war. The Emperor of Russia further engaged to France and England that the Aland Islands should not be fortified, or any military or naval establishment maintained or created there.

Several disputes subsequently arose regarding the interpretation of certain parts of this treaty, all of which, however, were at length satisfactorily arranged. One of these was regarding the Isle of Serpents at the mouth of the Danube; another was regarding the possession of Bolgrad, and the frontier of Russia towards the Danube. On the maps before the conference, furnished by the French government, the town of Bolgrad was placed at some distance from the Lake of Yalpuck, and the Russians strongly insisted on the possession of this town, in order to have a capital for the Bulgarian colonies, that still remained in their possession. It was subsequently found, however, that Bolgrad stood at the northern extremity of the lake, and to allow it to remain in the hands of Russia was directly contrary to the spirit of that part of the treaty which was to remove Russia from all direct communication with the Danube and Lower Pruth. Accordingly, Bolgrad was assigned to Moldavia; and to meet the desire of Russia to have a capital for her Bulgarian colonies, the town of Komrat, on the right bank of the Yalpuck, was given to her, the boundary-line from the point where the Kirsau falls into the Yalpuck proceeding up the former stream instead of up the latter. The Isle of Serpents, it was agreed, should belong to Turkey, and it was also agreed that the islands

History.

Statistics. included between the different branches of the Danube at its mouth, and forming the delta of that river, should, instead of being annexed to Moldavia, be replaced under the immediate sovereignty of the Sublime Porte, of which they formerly held. A treaty in these terms was signed at Paris on 19th June 1857 by representatives of the several powers.

The final evacuation of the Crimea took place on the 12th of July, on which day Sevastopol and Balaklava were formally given up to the Russians. The coronation of the

emperor took place at Moscow on the 7th of September, under circumstances of extraordinary splendour, and was attended by special representatives from all the powers with which Russia had been recently at war. The new monarch has already done much to ameliorate the condition of his subjects, by the adoption of many liberal and enlightened measures favouring the spread of education, encouraging commerce and manufactures, alleviating the burdens of taxation, &c., as will be found noticed in the different sections of the subsequent portion of this article.

Geography and Statistics.

Geographi- Russia, the largest of all empires, ancient or modern, in cal extent. the world, forms a connected territory extending west to east from 17. 40. to 232. 30. E. Long. from Greenwich; or in words, from the frontier post-station Pyzdry in Poland, on the Prussian border, at the confluence of the Wartha and Prosna, to Observatory Inlet, opposite the N.E. point of Queen Charlotte's Island in North America; and south to north from 38. 25. to 78. 26. of N. Lat., or from the most southerly inhabited point of the Russian empire, the mouth of the Astarà River in the Caspian, to Cape Severo-Vostotchnoi in Siberia.¹ Russia thus embraces nearly 215 degrees of longitude, or two-thirds of the circumference of the earth, and more than 40 degrees of latitude; one-sixth of the habitable globe, and one twenty-third of its whole superficies. Between its two farthest points, west by east, the length in a straight line is about 9681, and the greatest breadth about 2628 miles. The sea-board, which is little available, stretches over 25,100, and the land frontier over 9200 miles. The superficial area is difficult of computation; but, as nearly as possible, it may be estimated as follows:—

	Eng. sq. miles.
The forty-nine European governments ² ..	1,848,564
Poland	49,167
Finland	145,668
The Caucasus	167,832
Siberia	4,940,875
North American Possessions	370,905
	7,523,011
Recent acquisitions in Daooria and the Amoor	
region	1,059,730
Total	8,582,741

Where, however, extreme limits are not only far from precisely defined, but are even, through their vastness, partly unknown to the Russian government itself, where extension of frontier is almost yearly going on, and where the learned themselves disagree, entire accuracy is of course unattainable.

The Russian government admits of no distinction between European and Asiatic Russia, but views these divisions as forming a compact whole; some governments lying partly in Europe and partly in Asia. The natural boundary, however, betwixt European and Asiatic Russia is formed by the River Kara, the Ooral chain of mountains, the River Ooral to its mouth in the Caspian, and thence by the shores of this sea to the eastern extremity of the Caucasus. The natural division between Asiatic and North American Russia is formed by Behring's Straits. To the north Russia is bounded by Norwegian Lapland and the Arctic Ocean; to the east by British North America; to the south by the Sea of Okhotsk, the Gulf of Tartary, China, Free Tartary, the Caspian Sea (which it now mostly includes), Persia, Turkish Armenia, the Black Sea, and European Turkey; to the west by Moldavia, Galicia (including Cracow), Prussia, the Baltic Sea, Sweden and Norway. By the treaty of 1858 with China, the whole left bank of the Amoor, from its source down to the Oossoori, one of its chief affluents, belongs to Russia, and the right to China; from the Oossoori, downwards to the Gulf of Tartary, both banks now belong to Russia. The new measurement of the boundary with China will be laid down from an angle taken 60 versts (40 miles) up the Oossoori, and extending, as said, down to the Gulf of Tartary. Turning to another part of the territory, the impending absorption into Russia of the Caucasus will lend interest to a more circumstantial account of this region. The line drawn from the mouth of the Kooban,

¹ Russia, like Germany and many other powers, draws her first meridian from the island of Ferro, 20° W. from Paris, 17° 39' 50" 6 W. of Greenwich, and 47° 59' 30" 6 W. of Poolkova. Russia adopts this method for the sake of not having two longitudes, E. and W. She has now her own observatory at Poolkova, but calculations are made from that spot only for astronomical and chronometrical purposes. Russian navigation charts are generally constructed from Greenwich. Cape Severo-Vostotchnoi means North-East Cape.

² Those parts of the governments of Perm and Orenburg which are situated beyond the Ooral in Asia are included here.

Statistics. which falls into the Black Sea, to the mouth of the Terek in the Caspian, is called the northern boundary, or line of the Caucasus. The southern boundary extends from the mouth of the Reon to that of the Koor. The whole length of the Caucasian mountain range, from Fort Anapa on the Black Sea, to Cape Apsherôn on the Caspian, is calculated at 691 miles. The whole superficial extent of the Caucasian isthmus, reckoning from within the limits indicated, is 167,733 English square miles; of which are subjected to Russia 123,245, and are yet free 44,488. The whole population amounts to 4,058,064 souls; and of this number are already subjugated 3,391,064,—viz., Christians, 1,762,741; Mohammedans, or of other religions, 2,295,323.

The languages of all the mountain tribes are totally distinct, and show that these races were not originally a homogeneous people, but a residue of the different nations from various quarters, which were either driven to this spot of earth by other nations pressing on them, or were the subsidence both of them and of the aborigines. It is also worthy of note, that war is more seriously carried on in that region of the Caucasus which lies towards the Caspian, and in particular with the Lezghên and Tchetchênsi tribes; less so on the Black Sea region, with the Adêeghi, Oobêkhi, and Abkhâztsi tribes. It is further remarkable, that in the subjugated Caucasus only twenty-four souls go to the English square mile, whereas there are forty-nine to the English square mile in the unsubjugated portion; thus showing how these races are being fast hemmed in prior to their ultimate absorption into the Russian empire.

Generally, as regards the boundaries of Russia, the following remarks may be noted as of vital importance to England. The Asiatic border of Russia on China, and towards India, passes in the Keergheez region beyond the Caspian, down from Fort Peroffski on the Sir Daria, in an easterly direction, to Lake Teletski, and farther along the River Tchou round Lake Eesseek-kool, thence from Eesseek-kool to the north-east, where the regular Chinese boundary commences. The Rock-Keergheez dwell about this last-mentioned lake, in a cauldron-shaped hollow environed by snow-capped mountains of immense height. A little to the north of Lake Eesseek-kool, between it and the River Eelee, is situated Fort Vêrnoyeh, which commands the whole of this Keergheez region. Higher up, again, we come to the south-eastern boundary of Russia towards India, and would beg to call special attention to the following facts, as important to English policy. By the embankment of the Volga mouths at the Caspian, and the large establishments forming in that quarter, Russia is brought 2000 English miles nearer to India; and were once the Amoo Daria or Oxus reverted into its former course of disembogement in the Caspian, a navigable road is ready made to within 500 miles of Herat. The skill of the natives in this sort of work is quite astonishing. The consequences may be appreciated when we reflect that all past history shows how uniformly Central Asia has been the arena of events controlling the ultimate destiny of the human race. Any future struggle for mastery between Russia and England must eventually be fought out on this field. Let us look to it!

General aspect.

European Russia, together with Poland, belongs to that immense plain which begins in Holland, and extends over the north of Germany and the whole east of Europe. From the Carpathian to the Ooral range, a distance of 500 leagues, all is one undulating level, without a mountain to break the monotonous lowness of the horizon, or oppose a barrier to the winds. A great proportion of it, in the south especially, consists of those immense tracts called steppes, which, like the pampas of South America, present to the eye only a dead flat for many hundreds of miles. Occasionally, indeed, the surface is diversified by ancient tumuli, supposed to be the burial-places of the Scythians, and

here and there small table-lands occur; but the latter rise so gently as to be scarcely perceptible. Of these, the most worthy of notice are the Valdai Hills, situated in the governments of Moscow, Tver, and Toola, the loftiest summit of which, lying between the villages of Toloshva and Mostu, and the towns of Ostashkoff and Valdai, is only 1000 feet in height. No part of the Valdai Hills is very rugged; on the contrary, they form a gently-sloping plain; but the rivers and lakes are usually inclosed by steep banks. They form the watershed between rivers flowing into the Baltic and those flowing into the Black and Caspian seas; and here, within a short distance of each other, are the sources of the rivers Volga, Dvinâ, Dnieper, Lovât, Pola, and other smaller ones. To the north-east the land gradually slopes to the shores of the Baltic Sea, themselves mostly flat, and is for the greater part covered with immense forests, marshes, and turf-moors. Between this ocean inlet and the White Sea, on the N.N.W., lies an expanse of country richer in water than any other in Europe. Here a multitude of lakes, large and small, are united together like a net-work of water, and between them extend those rocky ridges which, on the north-west, rise into the inferior Finnish chain of hills. These, however, sink again towards the Lake Enara and the River Tana, without joining the Scandinavian system of mountains. Proceeding south-west from the interior hills of Valdai, the land also gradually sinks and changes into the immense marshes lying between Minsk and Volhynia, called Polêssieh. Through these the River Priepetz, the great feeder of the Dnieper, pursues its course, constituting their drain or outlet. The northern declivities of the Carpathian Mountains only in a few places cross the borders of the Austrian territory and enter Russia, but not as hills of any height. Near the sources of the Oder they stretch on towards the Vistula, and along this stream, in the form of a plateau 800 feet in height, rising eastwards between Pilica and the above river into groups of mountains, which extend in five parallel chains, having for a distance of 90 a breadth of about 50 miles. In two or three places they rise to the height of more than 1000 feet, and these are the loftiest points in Poland. Upon the other side, in the east, the declivities of the Carpathian range form a broad table-land, extending across the whole of Southern Russia. It thus separates the low land of the interior from the maritime country of the Black Sea. Unlike the table-land of Valdai, which bears on its broad surface lakes and fens, this southern plateau consists of large steppes, watered by the rivers Dniester, Dnieper, and Don, which here form cataracts. Between the last-named stream and the Volga it rises as a continuation of the lower Volga range, which, under the name of the Irgheni Hills, extends southwards to the Caucasus. On the peninsula of the Crimea a wholly insulated chain of mountains rises to a considerable height, and runs from east to west nearly 120 miles, close to the coast of the Black Sea. In one part it attains an elevation of 5185 feet. Along the eastern boundary of European Russia the Ooral mountain chain extends from the shores of the Frozen Ocean southwards towards the Caspian Sea for a distance of nearly 1500 miles, unconnected with any other mountain system of Europe. The northern portion of the Ooral chain, from the Straits of Waygats to the sources of the Petchora, consists of rough naked limestone rocks, and rises to a considerable height; but this part of the country is comparatively little known. The middle portion of the chain, as far as the sources of the Oofâ, called the Verkhotoorîs Oorals, forms a broad table-land of moderate elevation, overspread with morasses. Farther to the south the Oorals rise again in height, and become thickly wooded; whilst in the government of Orenburg they expand into broad ramifications on both sides of the River Ooral. The chain, with all its branches, sinks towards the Caspian, without coming into contact on the

Statistics.

Statistics. east with the mountain systems of Asia. It is called, at different points, the Orenburg, Bashkir, and Keergheez Oorals, and sends out an offshoot on the south-west between the rivers Ooral and Samàra,—the Obshtchei-Syrt, which stretches to the banks of the Volga. The Sok Mountains form a part of this spur of the Oorals. There are seven defiles or passes through this great range, the most practicable of which are the roads from Perm and Orenburg into Asia. Between the southern declivities of the Oorals and the Caspian Sea and Lake Aral there is an opening of about 280 miles in breadth, through which more than once the hordes of Asia have poured like a flood over Europe.

Steppes and toondras.

Steppes and toondras are an important feature of the geography of Russia. These steppes are treeless tracts of country, mostly level, although not uniformly so; and often bear heather or feather-grass, called *Kovèll* (*Stipa pennata*), on a soil sometimes fertile, and sometimes arid, marshy, or sandy. They are in their nature to the south and east what the toondras are to the north of Russia, in the governments of Olonetz and Arkhangel, mostly toward the shores of the Arctic Ocean. The toondras are also treeless wastes, bearing a poor vegetation of low shrubs on a moss or turf surface. The steppe region extends from the River Pruth, across the lower water-courses of the Dniester, Boog, Dnieper, and Don, as far as the Volga and Caspian Sea. There is but one declivity in the western part of this region, Bessarabia, where the Carpathians branch off; and in the southern, where the Taurian mountains rise. It is only in the western and middle parts that rich meadow-land is met with; the rest is poorly watered, thinly-populated, and, notwithstanding the occasional fertility of the soil, but little favourable to agriculture. The Taurian peninsula, although belonging by its position to the middle part of this flat region, has quite another character, and totally differs from it in the variety of its vegetable kingdom; the mountains and their declivities being covered with building and ship-timber, and the slopes with fruitful vineyards. In the valleys, particularly of the southern coast, the most delicate fruits attain to maturity. The eastern part of this plain, mostly sandy, is covered with bogs and salt-marshes; agriculture is almost unknown, and there is little arable land, excepting at the foot of the Caucasus. The land of the Don Kozzacks, an oasis in this part of the huge level, has a better soil, favourable to the pursuits of the husbandman. According to Pallas, part of this immense level must, at some remote period, have lain beneath the tide of the ocean.

Rivers.

The soil of Russia is so slightly undulated that to consider the spaces traversed by its rivers as true basins would be an abuse of terms, notwithstanding that it contains the most important water-courses in Europe. Some eminent geographers have adopted the plan of classifying the rivers according to the seas into which they discharge themselves; and as it has several advantages over the usual method of describing the streams of a country in the order of their size and importance, we shall follow it. In the declivity which slopes to the Black Sea and the Sea of Azoff there is (1.) the Pruth, an affluent of the Danube. It descends from the mountains of Galicia or Austrian Poland, and in the northern part separates Bessarabia in Russia from Moldavia in Turkey. (2.) The Dniester, which rises also in Galicia, and flows, winding serpent-like, towards Russia. Below Chotzim it is broken by rapids, so that near Bender boat navigation is interrupted; and without receiving any tributaries of importance, it falls into the Black Sea at the broad but shallow estuary or lake of Ovidovo. (3.) The Dnieper, which has its source in the government of Smolensk, on the southern slope of the Valdai Hills, and empties itself into the Black Sea below Kherson. This noble stream receives many tributaries; amongst which, on the right, flow into it the Berezhina, the Priepetz, and the Ingooletz; and on the left, the Soj, the Desna, Soola, Psiol,

Vorskla, and others. This river is the ancient Borysthenes. (4.) The Don, which originates in the small lake of Ivanovsko, in the government of Riazàn. After intersecting the Kozzack territory, to which it gives name, it discharges itself below Tcherkask into the Sea of Azoff by several mouths. In summer it is shallow; in spring it overflows its low banks to a great extent, and forms unhealthy morasses. Its principal affluents on the right are the Metcha, Nepriavda, and Donètz; and on the left the Vorònej (on which stream Peter the Great built his ships for the Black Sea), the Khopèr, Medvèditsa, Ilovlia, and Mânitch. (5.) The Koobàn, which descends from the northern side of Elburz in the Caucasus, flows first north and then west, upon the boundary between Asia and Europe. It separates into two main branches, the northern of which falls into the Sea of Azoff, and the southern into the Black Sea.

On the Caspian declivity we have (1.) the Volga, the largest river in Europe. It originates in a small lake in the government of Tver, near the village of Volgo-Verklovie, in the forest of Volkonski, in N. Lat. 57. It traverses lakes Oselok, Piana, and Volga; and on receiving the waters of the River Selizarovka from Lake Seligher, it becomes navigable, and falls into the Caspian Sea at Astrakhan by eight principal arms, which have in all sixty-five mouths, forming about seventy islands. It has thirty-eight navigable and one hundred and fifty-seven unnavigable tributaries, the principal of which on the left is the Kama or Little Volga, which has a course of about 1000 miles in length. Before the Volga receives the Kama the rivers Tvertsa, Mòloga, Oonja, Vètlooga, and others, join it on the left; and on the right the Okà, which descends from the water-shed where the Don and Dnieper originate, and the Soorà, which flows from the Volga hills. The Volga is upwards of 2000 miles in length. Its breadth at Astrakhan, where it embraces many islands, is 5 leagues. The depth varies from 7 to 18 feet. In the winter it is covered with ice throughout its whole extent, but there are always many apertures in the south from which currents of air escape, and hence they are termed the lungs of the Volga. During summer the Volga is crowded with thousands of boats, constructed in the well-wooded districts of Russia, and conveying from the interior all sorts of commodities to St Petersburg, where, being destined only for a single journey, they are usually broken up and sold. This noble river is the chief commercial road of the whole interior of the Russian empire. It encircles the central table-land, receiving, as we have seen, the Oka, the principal river of this fertile region. It communicates in the upper part of its course, by the canal of Vishni-Volotchòck, with the Lakes Ladoga and Onega; and lastly, the Kama conveys to it all the waters of Eastern Russia. (2.) The Ooral, formerly the Yaïk, but so called in conformity to a decree of Catherine II. in order to obliterate the remembrance of Poogatchoff's rebellion. It descends from the eastern declivities of the mountains that bear the same name, and, flowing in a smooth channel sufficiently deep for small vessels, traces out for a considerable distance the eastern and southern frontiers of the government of Orenburg, and the eastern limits of Europe. On the right it receives the Sakmara; on the left the Ilek; and after a course of above 1000 miles, falls into the Caspian near Gourieff. (3.) The Terek rises at the base of the Kazbek; receives on the right the rivers Songa and Aksai; on the left the Oorong, Tsherek, Bekhar, and Malka; and enters the Caspian by three principal mouths.

On the declivity of the Frozen Ocean we have (1.) the Petchora, which rises in the Ooral mountain range, and traverses the most solitary deserts of Russia, the governments of Arkhangel and Vòlogda. Its steep calcareous banks are broken by caverns and ravines; and hence its name Petchora, which in the Russian language signifies caverns. After receiving, amongst other tributaries, the

Statistics.

Statistics. Oossa on the right, and the Tzma and Tsilma on the left, it falls into the Arctic Ocean in N. Lat. 67. 10., its mouths forming an immense estuary. The length of its course is about 670 miles. (2.) The Mezen, which originates in some bogs in the government of Vologda, and after a course of 500 or 600 miles discharges itself into a bay of the same name on the shores of the White Sea, almost under the Polar Circle. (3.) The Dvina is the name which the rivers Sookhona and Yoog receive after their junction near Veliki-Oost-Yoog. The Sookhona flows from Lake Kooblnskoie, in the government of Vologda; and the Yoog rises in the same government, but is a much smaller stream. The Dvina does not assume the dimensions of a large river till after the junction of the Vytchegda, which falls into it on the right. Near Kholmogory the Dvina divides into several arms, and after a course of above 650 miles falls into a gulf of the same name. Its mouth is greatly obstructed by a bar of mud. (4.) The Onega, which is the outlet of several lakes, but not that of Onega, although it is situated in the neighbourhood.

The declivity of the Baltic Sea is furrowed by several rivers: (1.) The Tornéo, which originates in Swedish Lapland and after the confluence of its great tributary the Muonio, forms to its mouth into the Baltic the boundary between Russia and Sweden. The Muonio likewise traces for some distance the limit of the empire on this side. The Tornéo has a course of about 280 miles. (2.) The Neva. Its length from Schluselburg, at the south-west angle of the Ladoga Lake, to its mouth is 44 miles; its direction that of a straight line from east to west; its medium breadth about 1500 feet, and its depth, in many places 70 or 80 feet, is generally in the channel about 50 feet. The water of this river is remarkably pure. This noble stream is the only outlet for the waters of four great basins, each of which has an extensive natural reservoir of its own. These reservoirs are the lakes Onega, Ilmen, Saima, and Ladoga, the last receiving the drains of the other three. Ten different streams flow into the Onega, whose length from north to south is 120 miles, and its breadth from east to west 46 miles. It discharges itself into the Lake Ladoga by the Sveer, a river 133 miles long, and of very unequal breadth. The Ilmen is 36 miles long from north-east to south-west, and about 20 wide from north-west to south-east. It receives eleven streams, and has its outlet into the Ladoga by the Volkoff, 135 miles long, with a medium breadth of 400 feet. The Saima is a collection of lakes, gulfs, and bays, of all shapes and sizes, communicating with each other, rather than a single sheet of water, and is about 145 miles in length by about 50 in extreme breadth. It communicates with the Ladoga by means of the Voxa, a river about 119 miles in length, but not navigable in consequence of its several rapids, of which the most considerable, that of Imatra, has an inclination of upwards of 32 feet, forming a grander fall than that of Schaffhausen, and second only in Europe to the Trollhätta in Sweden. Besides the Sveer, Volkoff, and Voxa, the Ladoga receives the water of thirteen other streams. This, the largest lake of Europe, is about 130 miles long, 75 broad, of an oval form, and having an area of 6360 square miles. The Onega has an estimated area of 5300, the Saima of 2660, and the Ilmen of 300 square miles. (See PETERSBURG, &c.) (3.) The Dvina, or Southern Dvina, originates in a fen on the western declivities of the forest of Volkonski, in the government of Tver, not far from the sources of the Volga. It soon becomes deep enough to be navigable, but its course is broken by rapids and sandbanks; it falls into the Bay of Riga without having received in its course any affluents of importance. (4.) The Niemen, which rises in the forests of Kopisloff, in the government of Minsk, flows first in a northerly direction, and then, bending to the west, enters Prussia under the name of the Memel. On the right it receives the Vilia, a navigable stream; and on

the left one or two others, not important enough for notice. **Statistics.** (5.) The Vistula rises in the principality of Teschen in Austrian Silesia, at the foot of the western Carpathian range of mountains. It flows in an easterly direction to Cracow, where it becomes navigable, and as far as Sandomir forms a boundary-line between Galicia and Poland. Amongst its affluents the most important is the Boog, which originates on the northern side of a chain or lofty ridge of hills separating the chalky lands of Volhynia from the rich plains of Podolia, and receiving at Sierock the Nareff, a river which flows from the plains of Lithuania. Its other tributaries are the Wieprz, the Pilica, the San, and the Bzura. (6.) The Wartha, a river which rises in a plateau near Kromoloff in Cracow, flows in a broad channel like the Vistula, and inundates the neighbouring fields. After receiving the Ner it becomes navigable; and though not so deep as the Vistula, may be considered a large river. After receiving the Prosna, which for a great distance forms the boundary between Poland and Prussia, the Wartha flows into the Prussian territory, and joins the Oder.

The Baltic, the Black Sea, and the Caspian, will be found **Lakes, seas, and coasts.** described under their respective heads in this work. In the foregoing account of the rivers of Russia we have noticed four of the most considerable sheets of water in this country. Deep in the interior are a few pretty large collections of water; but lakes are not a characteristic of Russia, except in the north-west part, where Finland is situated. Here, indeed, immense numbers of winding lakes, of varied form and dimensions, intersect the country in all directions, giving rise to numerous rivers, but none of them irrigates a great extent of country. All these, surrounded by rocky shores, a sterile soil, and pine-clad hills, present the most striking scenery in European Russia, but afford few facilities for internal intercourse. The coasts of Russia are deeply penetrated by large arms of the sea, forming gulfs, bays, and creeks. Besides the Black and Baltic seas we have the Kara Sea, signifying "brown" or "hazel," which is the most easterly, and washes at once Europe and Asia. It is 450 miles in length; but navigation is almost constantly obstructed by the ice at its northern entrance. On the north-west is the Bieloie Morie, or White Sea, which itself embosoms a number of bays and gulfs of considerable size. The largest of these are the Gulfs of Mezen, Dvina, and Onega, so called from the rivers which flow into them; and Kandalask, which communicates with Lake Kovdozero. The White Sea is about the same length as that of Kara, with a breadth of from 60 to 70 miles. Between these two great inlets of the Arctic Ocean occur other gulfs; the most considerable being Tchëskaia, which is separated from the White Sea by the peninsula of Kaniskaia Zemlià; and that formed to the east of this by the estuary of the Petchora.

The extensive inlets of the sea above mentioned of course **Capes, &c.** form numerous promontories. In looking over a good map the most striking to the eye is Cape Kanin, the north-western extremity of the peninsula of Kaniskaia Zemlià. This neck of land, which separates the Gulf of Tchesk from the White Sea, stretches directly north into the Arctic Ocean, a distance of about 150 miles. Its breadth is between 40 and 50 miles. Cape Onega projects into the White Sea near the bottom of that gulf, and forms the Bay of Arkhangel on the N.E. and the Bay of Onega on the S.W.

The geological structure of Russia in Europe corresponds **Geology.** in its vastness and simplicity to the other characters of that huge empire. Single formations extend over spaces equaling whole kingdoms, and have never been broken up or subjected to those igneous convulsions which have complicated the structure of other parts of Europe. From Finland and the shores of the Baltic, till we reach the low ridges of the Ooral, and from the Arctic Sea almost to the Black Sea and the Caspian, no trace of igneous or intrusive

Statistics. rock breaks the wide expanse of the regularly-stratified deposits.

The oldest and deepest-seated strata are the great masses of granitic and hornblende gneiss, generally dipping S.E., which compose nearly the whole province of Finland. They form a low, undulating country, full of irregular lakes and morasses, and rarely varied even by intrusive igneous rocks except near Lake Onega. But immediately south-east of the depression from the White Sea to the Gulf of Finland, the series of fossiliferous deposits begins. The first of these is the Silurian formation, stretching from the southern extremity of Lake Ladoga, by St Petersburg and Esthonia, to the islands Dago and Oesel in the Baltic. The Lower Silurian is well seen in the cliffs of the Esthonian coast, and forms all the flat country round the capital. It begins below with beds of blue or greenish clays, marked with fucoidal impressions, and still so soft and plastic as to be readily moulded with the hand, though the equivalent in age of the hard, compact slaty rocks of Wales. Above are beds of white or yellow sand, occasionally hardened into a calcareous sandstone, named the unguite grit by native geologists, from the abundant remains of the horny shell of the obolus or unguite. Dark-coloured graptolite slates, often bituminous, and a thin band of greensand, containing the curious bodies named conodonts by Pander, and supposed by him to be teeth of fishes, but which are rather remains of molluscs or annelids, follow. These are covered by the Pleta or orthoceratite limestone, rich in remains of trilobites, orthidæ, orthoceratites, and other characteristic fossils, identifying it with the strata of our own country. Above these deposits, especially in the island of Oesel, bands of marly or dolomitic limestone, often grey-coloured and full of the pentamerus and other fossils, represents the Wenlock or upper Silurian of England. In this region all these beds are soft, incoherent, and slightly consolidated; and it is only where they again appear in a narrow zone skirting the western declivities of the Ooral, and pierced by the granites, syenites, porphyries, and trap rocks of that chain, that they assume a harder and denser structure, and even graduate into metamorphic and crystalline strata.

Next in order is the Devonian, or old red sandstone formation, extending over a much wider surface of 150,000 square miles, and thus considerably more than the whole British Islands. Beginning in Courland and Livonia, and resting on the Silurian beds, one branch runs north to the shores of the White Sea, beyond Arkhangel, and skirts even the west coast of the Kola peninsula. Another branch extends south and east from the Valdaï Hills, by Smolensk and Orel, to the valley of the Don, north of Voroneje. In the northern band sands and marls prevail south of St Petersburg, and in the great region from the Baltic provinces to Orel red and green marls, shales, and sands are covered by, or alternate with, laminated limestones. In these beds fossil fish, —as the gigantic *Asterolepis*, the *Osteolepis*, *Diplopterus*, *Dipterus*, *Pterichthys*, and lately the *Coccosteus*, —characteristic of Caithness and the north of Scotland, —are associated with the typical mollusca of Devonshire and the Eifel. This important fact, first recorded by Sir R. I. Murchison and his colleagues, thus casts a most valuable light on the structure of our own country, where these dissimilar types of life have never been found conjoined.

To the east and north, as is well seen in the Valdaï Hills, the Devonian strata are overlaid by a scarcely less extensive deposit of Carboniferous beds. From Cape Voronin, on the White Sea, they run down through Novgorod, Tver, and Moscow, to Riazan, forming the upper basin of the Volga, and the low plateau from which this river, the Don, Dnieper, and Dvina diverge to the far-separated Caspian, Euxine, and Baltic seas. Sinking down below the newer formations in the centre of the kingdom, they re-appear in a long, narrow zone along the flanks of the Ooral, and in other

Statistics. detached portions, showing an enormous underground extension. In all this region it is, however, chiefly the lower parts of the formation, or the mountain limestone, with its characteristic crinoids, producti, and spirifers that are seen, and the few seams of coal are thin and poor in quality. Like the associated strata of sand and clay, the coal is only half-mineralized, and more resembles the tertiary lignites than the true coal of Western Europe. Recent attempts, too, to find workable coal by boring through the overlying Jurassic beds at Moscow have failed; a small detached field between the Donetz and the Sea of Azoff alone affords a better promise. There several seams of good coal, interstratified with sandstone, shale, and limestone, have been wrought; and though the beds are often broken and highly inclined, Sir R. I. Murchison thinks that valuable and extensive deposits of this mineral may yet be discovered in that vicinity.

The Permian, which succeeds, is the most extensive formation in Russia. It was so named by Sir R. I. Murchison from its full development in the ancient kingdom of Perm. Touching on the shores of the White Sea and Arctic Ocean in the north, and skirting the base of the Oorals in the east, it occupies the whole basin of the Dvina, the Kama, and the northern tributaries of the Volga, and runs south into Orenburg and the Keerghees steppes. Everywhere the beds are nearly horizontal, but of very varied mineral character—grits, sandstones, marls, conglomerates, and limestones inclosing great masses of gypsum and rock-salt, and often impregnated with copper ores. According to Von Qualen, it consists, in the province of Orenburg, of three divisions: the lower division, very rich in copper ore, is composed of large masses of gypsum, thick beds of red, brown, and grey sandstones and conglomerates, and of various marls, with limestones and thin layers of coal. The middle division consists of clays and marls, with many beds of limestone and slaty coal, but less abundance of copper ore. Fucoids and ferns, producti, and other molluscs, with remains of fishes and Saurian reptiles, occur in this and the lower division, and in the latter, also, innumerable fragments of fossil wood. The third or upper division, of thin layers of marly or tuffaceous limestone, with no fossils, is seen only on the top of some hills and plateaux. The most remarkable feature of the Permian formation in Russia is the abundance of copper ore and gypsum. The ores of copper are chiefly malachite and azurite; but cuprite, native copper, and copper pyrites also occur. These ores are mostly mixed in the sandstones and marls, rarely in small nests, and are peculiarly rich on the broken stems and branches of trees that abound in the sandstones of the lower division. Generally there is only one metalliferous bed, from a few inches to less than six feet thick, but occasionally more than one is seen. These copper ores are found all along the foot of the Ooral in Orenburg and Perm, but decrease as the distance from the mountains is greater, and disappear beyond 300 to 350 miles from their foot. The gypsum also follows this mountain chain in an unbroken band from Orenburg to beyond 60. N. Lat., with a breadth of about 80 miles near Perm, but extends farther west into the basin of the Dvina. Numerous salt springs and beds of salt, in some places 50 feet thick, accompany this gypsum. The most remarkable salt deposit is found at Illetzkaya-Zastchita, in the barren wilderness south of Orenburg. At that place a mass of pure salt, more than a mile in diameter, is wrought at an open quarry 70 feet deep, and, according to Rose, yields about 700,000 poods of salt annually.

Resting on the Permian, though separated from it by a long geological interval, during which the Trias and Lias of other parts of Europe were deposited, come the Jurassic strata. These consist chiefly of incoherent, dark-coloured clays and sands, containing many characteristic fossils of the middle oolite, —ammonites, belemnites, gryphæa, and tere-

Statistics. bratula. In the centre of the country it extends from Moscow, where it rests on the carboniferous beds, by Vladimir to Simbirsk on the Volga. Farther north it forms the great marshes along the watershed of the Dvina and Volga, and also fills the trackless valley of the Petchora, between the Timan Mountains and the Ooral, covered by marshy forests and bleak tundras. All this region is a low, scarce hilly, land; but on the south shore of the Crimea and the flanks of the Caucasus it rises into a more varied mountain country, and contains a richer store of corals and crinoids than in its northern extension.

These Palæozoic and Jurassic strata compose the northern and larger half of European Russia. The newer cretaceous and tertiary beds occur only in the southern portion, drained by the rivers flowing to the Caspian and Black seas. Their northern boundary is marked generally by a line drawn from Memel, south-east to Voroneje on the Don, thence north to Jelatma on the Oka, and again south-east to the southern end of the Ooral and Lake Aral. The chalk is chiefly seen in the central region between the Dnieper and Volga, but probably is concealed below the tertiary beds in other parts of the great plain, as it rises through them in irregular patches in many localities. According to Von Buch, the chalk in the north belongs chiefly to the upper beds, whilst the lower Neocomian, or greensand, is seen only in the south near the Caucasus, where Abich estimates the formation as 5000 feet thick. The rocks in the north resemble those of Western Europe, or are pure white chalk, forming highly picturesque rocks on the Donetz, chalk-marls, and ferruginous sands. Near Voroneje, sandstones containing 31 per cent. of phosphate of lime have been described by Khodnieff. On both flanks of the Caucasus this formation is partly represented by a formation, several thousand feet thick, of clay slates, in which fossils characteristic of the chalk occur, though not in abundance.

The older tertiary, in many places composed of clay, and not distinguishable in aspect from the similar deposits in the London basin, extends from the Baltic to Poltava, north of the Dnieper. Large masses of it also cover the chalk strata to the west of the Volga; and in the south of the Crimea the nummulite formation is well seen resting on the chalk and oolite rocks. The upper tertiary, widely extended from the Dniester to the Caspian, and over the wide steppes from the Volga to the Ooral, is more interesting. This formation begins with blue marls and clays, alternating with a yellow calcareous tufa. In the higher part the tufa alone prevails, and is almost entirely made up of broken shells, partly freshwater, partly brackish-water species, either identical or closely analogous to those now living in the Caspian. This formation, spread far and wide over the vast steppes round the Caspian and Aral seas, and used as the common building-stone even in Odessa, proves the former enormous extension of an inland sea of brackish water. According to Murchison, this sea, larger than the Mediterranean, was reduced by two elevations, the latter leaving only the present Caspian behind.

Connected with the same recent period must be placed the formation of the gold sands of the Ooral, and the extinction of the mammoth, rhinoceros, and urus, whose bones are so often imbedded in them. The dispersion of erratic blocks over Russia and Northern Europe is a kindred phenomenon. More important for the agriculture of Russia is the *chernozem*, or black earth, found only in the southern provinces, and unquestionably the finest soil in the empire for the production of wheat and grass. "It is so fertile," say Sir R. I. Murchison, "as arable land, that the farmers never apply manure; and after taking many crops in succession, leave it fallow for a year or two, and then resume their scourging treatment." It has been supposed of vegetable origin, but is more probably derived from the waste of the Jurassic beds.

(For further details on the geology, &c., of this vast empire, see especially *Russia and the Ural Mountains*, by Sir R. I. Murchison, E. de Verneuil, and Count Keyserling, 2 vols. 4to; *Siluria*, by Sir R. I. Murchison, 2d edition; *Reise nach dem Ural*, von G. Rose; the *Petchora-Land*, by Count Keyserling; with many memoirs in the Russian and German scientific journals; and for the distribution of the rocks, the *Geological Map of Europe*, by Sir R. I. Murchison and Professor Nicol.) **Statistics.**

In a country of such vast dimensions, the soil must of course vary considerably in different situations. There is a vast tract of territory, 65,000 geographical square leagues in extent, which possesses a peculiar and rather remarkable soil. Indeed, Ritter, in his *Erdkunde*, informs us that there is only one other place on the surface of the earth where anything similar in soil has been discovered, and that is the north of Hindustan. It consists entirely of decomposed vegetable matter, and is deposited in a thick layer. It is situated in the S. of Russia, stretching in a broad belt from Volhynia, in a north-easterly direction, to the foot of the Ooral chain near Perm. It is prolonged on one side from this to the shores of the Black Sea; and on the other it stretches from Perm to Orenburg, and thence to the Caspian Sea. All this vast tract, exceeding in extent France, Spain, and Prussia united, is covered throughout with a stratum of vegetable mould, which varies in thickness from 3 to 5 feet. It is so extremely productive as to stand in no need of manure. Its fertility is shown in the large returns of grain, especially rye, which it yields; and in the excellent breeds of cattle which are reared upon it. From the thinness of the population, vast tracts of this country still remain unoccupied. The soils of the steppes, which cover so large a portion of Russia, we have already adverted to when describing these plains. The country between the Dniester and the Dnieper has a soil impregnated with nitre, a substance deleterious to vegetation; yet, as soon as it is removed or diminished, wheat, millet, and the arbuté melon, may be cultivated with great success. The mildest and most fruitful region in all the Russian empire is that continuation of valleys arranged in natural amphitheatres at the southern base of the Taurida, along the coasts of the Black Sea. Proceeding eastward, we come to the government of Astrakhan. Only part of its soil is fertile. This portion includes the low districts on the banks of the Volga, the Ooral, and the Terek, and is by no means large; but here vegetables attain an enormous size. The soil is impregnated with saline and bituminous substances. Higher up, the land on the Volga becomes sandy and unproductive. The soil of Little Russia and the Polish Ukraine is partly sandy and not very fruitful, partly very rich and fertile. A great part of Western Russia is sandy, and intersected by vast marshes and bogs. Large tracts are covered with immense forests, the retreat of the bear, wolf, and wild boar; whilst not an inconsiderable portion of this westerly territory ranks amongst the most fertile in the empire.

It thus appears, with regard to the soil of Russia, taking a summary view of it along with the climate, that from the 44th to the 50th parallel of N. Lat., comprising Bessarabia, Podolia, Kherson, Yekaterinoslaw, and Taurida, it is for the most part low and level, little wooded, partly very fruitful, partly arid and unfruitful, besides being here and there impregnated with salt. The winters are short, with little snow; but in some parts the cold is severe. The spring is early and mild; the summer is of long duration, with oppressive heat and little rain; autumn follows late in the year. Violent whirlwinds are frequent, and the S. of Russia is subject to tremendous snow storms, called *metél*. The middle or temperate district, extending from 50° to 57°, has a rough and lasting winter, especially in the eastern territory. This district is the largest and wealthiest portion of the empire, forming broad, open, undulating

Statistics. plains, over which, up to the declivities of the Ooral chain upon the E., only slight elevations break the monotonous level. The northern district, from 57° to 67° in European Russia, has a much milder climate than the same parallels in Asia. With the exception of the wooded mountains of Finland on the W., it is, as far as the Oorals, a continuation of the former flat land, upon which forests, meadows, marshes, and moor ground alternate with one another. The poor, meagre soil only insures the husbandman a return as far as the 60th parallel. The winter here is long and severe, there being six or seven months in which sledges are the only mode of travelling. Mercury freezes in winter, and the autumn is foggy. Here only slow-growing timber succeeds, and beyond 67 is confined to dry, stunted shrubs. From 64° the rearing of cattle is always difficult, and agriculture is limited to roots. Under the parallel of 66° the sun does not set on the 21st of June, nor rise above the horizon on the 21st of December. Snow and ice often set in at St Petersburg about the middle of October, and sometimes continue till the middle of April. For 160 days,—that is, from the end of November till the middle of April, the Neva is generally bound fast with ice. In summer the W., S.W. and N.E., in winter the S.W., S., and S.E. winds prevail. The climate in this part has become much milder, through the cultivation of the soil and the hewing down of the forests. The quantity of rain which falls is about 18 English inches at St Petersburg, and the number of rainy and snowy days is reckoned at about 150 at St Petersburg. The following table has been supplied us by Academician Vesseloffski, and is extracted from his recent learned work on the Climatology of Russia :—

	Number of Snowy and Rainy Days.	Quantity of Water. English Inches.
Western region	146	22
Baltic "	140	21
Northern and central region.	114	20
Eastern region... .. .	113	16½
Southern steppe	83	11½

" Taking, for St Petersburg," Academician Kupffer informs us, "the mean temperatures of every month, they are, during five months, below 32° Fahr. The mean annual temperature is 38°·9 Fahr. The difference between the mean temperatures of winter and summer, calling by the name of winter the months of December, January, and February, and by that of summer the months of June, July, and August, is 42°·5 Fahr. At Yakootsk in Siberia, Lat. 62. 2., Long. 129. 73. E. from Greenwich, the mean temperature of the year is + 12°·2 Fahr.; that of winter, December, January, and February, — 36°·6 Fahr.; and that of summer + 58°·3 Fahr.; the difference, therefore, between the mean temperatures of the summer and of the winter is 95°. Notwithstanding the rigour of the climate, the culture of rye has been attempted with success." In the Arctic or hyperborean region, extending from 67° to 74°, the rigour of the climate tells both upon men and domesticated animals, as well as upon vegetation; for neither attain their full size. In Arkhangel the sun rises on the 23d of December at 2 minutes past 10, and sets 57 minutes past 1; whilst on the 23d of June it rises 14 minutes past 1 in the morning, and does not disappear below the horizon until 49 minutes past 10 in the evening. Beyond 67°, however, the climate is one long summer day and one long winter night. The summer is still much overcast with vapours, which obscure the sun. The dreary region of winter is somewhat cheered by splendid moonlight and the brilliant phenomenon of the aurora borealis. Trees entirely cease about 67°, only hardy shrubs being able to endure the intense cold of the climate. In St Petersburg in 1759 the cold was 41° Fahr. below zero, and in the winter of 1809–10 quicksilver froze into a solid mass in

Moscow, and was extended with a hammer like lead. As Statistics. this metal becomes solid about 32° Reaumur, we may reckon the degree of cold in this case as exceeding 40° Fahr.
